take place the numerous checks in May caused Peaches and Apricots to drop until the end of June. Apples in this district are plentiful and good. Apricots are very thin, and the trees have suffered much. Peaches and Nectarines under glass copings required thinning, the trees are clean and free from blister; where boards only were used, with fishing nets in front, the crop is very light and the foliage badly blistered; growth late, but now kind. Cherries set well, but three-fourths of the crop were destroyed. Plums are a complete failure, many of the trees much injured last year did not produce a blossom. *W. Coleman, Eastnor.*

Devon.—There was a capital show of all kinds of fruit in the early part of the year—almost every tree was a sheet of blossom; but the severe weather we experienced in April and May not only destroyed every prospect of a crop of fruit, but also very much crippled many of the trees. Apricots, Pears, Plums, and Cherries, are almost a total failure; Peaches and Nectarines about half a crop, Apples about a quarter of a crop. Small fruits are plentiful, and of good quality. Filberts and Cob Nuts are abundant. I have been here nearly twenty years, and it has been the most trying season I have had to contend with. *A. Ayson, Oxtou House, Kenton.*

—Of cider Apples, which are mostly grown in this district, there are very heavy crops of particular sorts in some places. Some sorts of Pears carry heavy

crops, but the tender varieties are thin, having dropped off after setting, owing to late frost. Owing to the same cause Plums are also very thin. Pears and Nectarines are very thin, and there was not a leaf on the trees outdoor on walls at midsummer, the blister being very bad. *Alfred George, Bickton.*

Somerset.—The fruit crops this season are mostly under, and, I believe, on account of the cold windy weather we experienced in the spring. The beginning of June was very cold; the Peach and Nectarine trees were looking wretched, and most of the leaves were blistered. There was plenty of blossom, but it did not set. In many gardens the trees will not recover. *W. Hallett, Cossington Farm.*

Worcester.—We have again to report unsatisfactorily as regards the condition of our fruit crops in so far as it applies to Apricots, Apples, Pears, Plums, and Cherries. Seldom was the destruction of these more complete, or the residue of so inferior quality. Truly there are exceptional orchards where moderate crops of Apples may be seen, but this is very exceptional. Apricots, Pears, and Plums are a failure. Weeks after witnessing the destruction of these we were in expectation of a better result in regard to the Apple crop, as they were so profuse in blossom buds, and unusually late in flowering; but in this we were again doomed to disappointment. The flower lacked in a remarkable degree that vigorous development attendant on thorough maturity, and dropped,

the young tissues being destroyed from excessive cold of so long duration co-operating upon an enfeebled development is, in my opinion, the main cause of our most seriously felt loss over Apple crops. Not only have the early sorts failed, but late kinds, such as Bitter Sweet's, share the same fate. To place much reliance upon certain kinds that are bearing this season would be a mistake. With me the Ribston Pippin is bearing the largest crops, whereas Lord Suffield does not carry an Apple; neither are the Keswick Codlins, or King of the Pippins, carrying crops, though these sorts are grown in quantity. *Geo. Westland, Willy.*

As a general rule stone fruits of all kinds are very deficient—Plums especially so. Peaches and Nectarines a fair crop here but very late; the general average cannot be more than one-fourth of a crop. Apples of the best kinds very partial; cider fruits half a crop in sheltered situations. Pears very thin, a light crop on west walls. Bush fruits generally good, as also Strawberries. Nuts very abundant. Walnuts a few on some trees. Failure of crops generally may be attributed to the severe frosts early in May, and a long continuance of sunless weather and cold storms. *W. Cox, Madresfield.*

The poorest crops of fruit here for the last seven years. We generally have abundant crops on walls of Pears, but this year they are very thin. Peaches are all but a failure, and some of the trees will die outright. The later kinds of cider Apples appear to have escaped the severe frost, and there are a good quantity in places, but rather partial. There is a good crop of perry Pears in places, but partial. Plums and Damsons are all but a failure in this neighbourhood. *John Wyke, Kyre Park, Tenbury.*

Kent.—Never in my recollection was so fair a promise followed by so poor a performance. The blossoms in every way were as abundant as one could wish, but, without any very great severity of weather, the long continued low temperature, and almost entire absence of sun for so many weeks, caused the embryo fruit to fall off by thousands. At one time there was a promise of an enormous crop of Cherries, but so soon as the energies of the trees were taxed in the stoning process the greater portion fell off. Standard and pyramid Pears are also a blank, as are also most varieties of Plums in the open quarters; of these Victoria and Prince Engelbert have proved the hardiest. *John Cox, Rallau.*

The Plum crop is the smallest known for many years. Pears are very short. Apples vary, some sorts bearing heavily, others a complete failure. Nuts a large crop. Under fruit has been plentiful. Taking it broadly, it is not a fruit year. *Lewis A. Killick, Mount Pleasant, Langley.*

Raspberries, although very much cut up with the unpropitiated May frost in the valleys here, pushed fresh growth and bore a heavy late crop. Gooseberries, although many dropped off from being frozen through, are bearing a large crop of fine fruit. *H. Cannell, Swanley.*

In some of the orchards in this locality a few kinds of Apples are bearing heavy crops, such as King of the Pippins, Wellington, Blenheim Orange, Lord Suffield, Small's Admirable, and Golden Knob. Pears are everywhere scarce, on standards, pyramids, and bushes. Plums and Damsons are a complete failure. Gooseberries, Raspberries, and Currants are a good crop, and fine. Of Nuts both Filberts and Cobs are an excellent crop. *C. Haycourt, Barham Court.*

Gloucester.—In general most kinds of fruit trees grown in this district showed abundance of blossom, but the May frost proved very destructive. On standard Plums there are only one or two on many trees; a few more on the walls. Peaches and Nectarines suffered very much. Pears and Apples set moderately but dropped off, leaving dozens of trees with none; the earlier kinds chiefly have escaped with a few. *Thomas Shingles, Tortworth Court.*

In sheltered places the fruit crops appear to be an average, but in exposed situations quite a failure, with the exception of small fruits, which are in plenty, although the fly appeared to be very destructive in the early part of the season to the foliage, but the late rains have pretty well cleared them off. *W. J. Simpson, Kingscote Park.*

Cornwall.—Perhaps never was east wind more severely felt in this county than at the season just as the blossom and tender foliage opened. In exposed situations it carried away all prospect of fruit, and

left a withered appearance on all trees both in fruit garden and forest. Owing to the nature of the soil—generally speaking—and also the influence of both east and west winds—which carries with it a salt spray across the county—dwarf trees in orchards and gardens are to be recommended. *H. Mills, Enys.*

Fruits of most kinds are far below the average. Nuts are an exception, being very abundant by the roadsides and in plantations. They are very little cultivated. Apples are an entire failure in many places, and everywhere thin. The Red Juneatings are now ripe. An Apple locally named "Polly" and Hawthornides, are the most prolific this season. *J. Tyerman, Tregoney.*

Dorset.—The fruit crops in this neighbourhood are very bad. Apricots, Peaches, and Nectarines are a complete failure, and the trees are a perfect wreck. Apples will be very good in some places. Small fruits are very plentiful and good. Nuts in some places will be very plentiful, especially the common Hazel Nut. *W. G. Pragnell, Castle Gardens, Sherborne.*

The supply of fruit in this neighbourhood is decidedly much below an average, and not equal in quality to some years. Peach and Nectarine trees are suffering from mildew and gumming, probably the effect of the changeable and cold weather we experienced in the early part of May. The Pear crop is almost a total failure. The Apple crop is much below expectation, as the trees when in flower were perfect pictures, but subsequent cold south-east winds destroyed a large proportion. *Henry Munro, Clevedlands, Lyme Regis.*

Middlesex.—Bright and cheerful were the prospects this season of an abundant fruit crop. How sad the result! Blossom was abundant and late. The actual frost was not so severe, and no material damage or loss could be traced to its direct agency, the loss must therefore be attributed to the long-continued low cold temperature, the absence of sunshine, and the almost perfect stagnation of vegetation during the flowering period. Plums are almost a blank, a few only on Rivers' Prolific, and Mitchelson's. Pears very scarce—Aston Town being the only variety bearing a full crop: Hessel, B. Hardy, Jargonelle, and some others half a crop. Apples are very partial—Cox's Orange Pippin, Hawthornides, Yellow Ingestre, Stirling Castle, Lord Suffield, Small's Admirable, heavily laden. Filberts are singularly abundant. Peaches on walls and in unheated Orchard-houses are alike scarce. *A. F. Barron, Chiswick.*

The fruit crop, with the exception of Strawberries, bush fruits, and Nuts is probably the worst ever known in the neighbourhood; most things bore a profusion of bloom, but the flowers individually were so small and weak when closely examined as to give little indication of setting. There was not sufficient frost here to account for the failure, $6\frac{1}{2}^{\circ}$ being as much as was registered by a reliable instrument. My impression is that the weak indifferent character of a great deal of the fruit bloom is attributable to the late unseasonable growth that was more or less excited in deciduous trees and shrubs of all kinds, edible fruits included, by the copious rains that fell at the end of August and beginning of September—after the premature stagnation of growth suffered through the drought from the middle of June to near the end of August. Apples and Pears in many cases retained their leaves in a green state for a month beyond their usual time, and when they fell were of a brown or blackish colour, instead of the yellow fully-matured tint. *T. Baines, Southgate.*

Perhaps never was the prospect of an abundant fruit crop more promising than this season. The trees generally were covered with bloom, looking far more healthy and vigorous than usual; but those severe frosts (8°) we had for two successive mornings in the early part of May destroyed all our hopes. The Peach trees have been much injured by blister and black-fly; they are, however, now greatly improved. *T. P., Stanmore.*

A general failure of the fruit crop, with the exception of Apples, of which there is a good crop in some orchards, and a moderate one in others. *Chas. Lee, Hounslow.*

Salop.—Peaches and Nectarines are scarce, although a few trees carry a fair crop, and are healthy. Except Jefferson's and Victoria, Plums are a total failure hereabouts, and this holds good with regard to Damsons. Cherries on walls are plentiful, but the "earlies" have been sadly spoiled by the excessive wet. Morellos have not taken any harm. The

amount of rain measured here during July was upwards of $5\frac{1}{2}$ —5.63 inches. Several trees of Apples are loaded, but upon the whole we have not half a crop, and it is the same with Pears, both standards and wall trees. Bush fruits are plentiful—Nuts a very heavy crop; a good many Walnuts are falling off. *A. S. Kemp, Haughton, Shifnal.*

Surrey.—All stone fruits are very scarce indeed in this neighbourhood, and in a great many places there are none at all. Apricots flowered profusely, but were destroyed by frost. In spite of a thick covering of canvas, the flowers and fruit just setting were blackened by frost, and very few indeed survived. Peaches and Nectarines set a prodigious crop, but they fell off at a very early stage of growth. There was no frost at the time, nor had not been for many days. I attribute the cause of their falling to the unripened state of last year's wood, and the cold, biting east winds which we experienced so long in the spring of the year. Our garden is on a level with the top of St. Paul's, consequently we are pretty much exposed to the influence of the winds—the east in particular. The Peaches commenced growth, and made nice shoots, but the east winds parched them up, and in a few days the trees had the appearance of having passed over a hot fire, and what green leaves were left were all blistered. For some time I was afraid the trees would never do any good any more, and it was not until midsummer that they made any progress at all. Pears may be considered a total failure, as what few fruits are scattered about on either wall trees or pyramids are not sufficient to call a crop, even if they were all on one tree. This year I had a quantity of pyramid trees covered with thick canvas and mats, the covering being put on at night, and removed every morning, but the trees have no more fruit on than those that were fully exposed. Of Apples we have a good crop on a few trees, viz., Ribston Pippin, Cackle Pippin, Fearn's Pippin, Lord Nelson, Claygate Pearmain, Mannington Pearmain, Summer Golden Pippin, Yellow Ingestre, Court of Wick, Cornish Aromatic, Gloria Mundi, Golden Reinette, Alexander and Devonshire Quarrenden. Other varieties are very scarce, and in many instances none at all. Mulberries are an abundant crop; Quinces none at all; Medlars none; Walnuts plentiful; Filberts, Cob, and common hedge Nuts, a most prodigious crop. *J. Ollerhead, Wimbledon, S.W.*

We have, on the whole, with the exception of wall fruit, such as Plums, Peaches, and Nectarines, a very fair crop. Apples look very well, though in some districts they are scarce. Small fruit has been very abundant, and of good quality. Hardy Grapes have a very good crop. Pears are a short crop, but of good quality. Strawberries have been inferior in flavour, owing to so much wet. *J. Burnett, The Depeene, Dorking.*

Apricots were very early in bloom, set well, but owing to the spring frost and long continuation of east and north-east winds, they all fell, the Pears followed in the same way. Apples were later in bloom, and promised well; but for some unaccountable reason did not set well, and at one time looked even worse than last year, they have partially recovered, and the fruit that is left looks healthy, but late. *William Kemp, Albury Park, Guildford.*

This is one of the worst seasons for fruit that has been experienced in this neighbourhood for several years. *William Kidd, Tandridge Court, Redhill.*

ODONTOGLOSSUM VEXILLARIUM.

The appearance of the plants of this most beautiful Orchid in many collections leads me to believe that the conditions requisite for its successful cultivation are not altogether understood. On Tuesday last I sent two specimens to the Floral Committee of the Royal Horticultural Society, which have been so much admired for their health and vigour that a few particulars regarding them may not be unacceptable. They were bought at Stevens', in May, 1874, out of an importation by Messrs. Veitch, and were chance pieces bought for me by a friend. One is the pale, the other the rosy variety. The former has two young bulbs, bearing seventy-five flowers on thirteen spikes; the largest number of flowers on one spike is ten, and four spikes spring from the apex of one bulb. The rosy variety has also two young bulbs with fifty-five flowers on eight spikes, one of them branching.

The flowers measure $4\frac{1}{2}$ inches by $3\frac{1}{2}$ inches, some of them being of course smaller than others. On the latter plant both breaks are growing from the same side of one old bulb, one above the other, and in both plants this year's bulbs are at least twice the size of the largest of the imported bulbs. These plants have kept their foliage unusually long, that of 1875 being still fresh and vigorous. The leaves are all of them tinged with the bronzy purple characteristic of this *Odontoglossum* when in fine and vigorous health.

Odontoglossum vexillarium should be grown in winter in the coolest part of a Cattleya or Mexican house, with a temperature ranging from 55° to 65° Fahr. It should be moved without delay, as soon as the weather permits, into an *Odontoglossum*-house, where it should have abundant light without sun. At all seasons it requires a liberal supply of moisture. The result of too great heat is that the leaves spot and go off at their points, the growths are weak and unsubstantial, and the whole plant is of a less vigorous and sound constitution. These plants should be potted in a shallow compost of sphagnum with a little fibrous heat, well drained, and should be put into large pots, so as to give ample space for the roots they love to push long and far through their mossy bed. *O. vexillarium* is liable to yellow thrips, which disfigure it much, but it will stand a moderate smoking with pure tobacco. *Trevor Lawrence.*

Forestry.

DISEASES of trees may be divided into two classes, namely, those that affect the roots and fibres, or part of the tree underground, and those that affect the stems, branches, and leaves, or part above-ground.

Upon the former I have to make the following general observations, without attempting to exhaust the subject. It is a well-established fact that some species of trees, as the Beech, grow best in dry soils, while others, as the Willow, grow best in moist, if not wet soils. The proverbial aquatic habits of the Willow, however, have led to not a few errors and mistakes, not only in connection with itself but also with several other species of trees. The common Alder, for example, is frequently planted in soft and boggy situations, as if it preferred these to those suitable for Ash, Elm, or Sycamore, which it does not. It is true that Willows, Alder, and Poplar generally, thrive comparatively well in damp, soft, and boggy situations, where Beech, Elm, and Sycamore would degenerate and decay. The former species, however, will not refuse to grow in any situation where the latter succeeds; hence it is to be inferred that one class of trees is more accommodating than another. I think it may be considered an established fact that such species as grow best in wet soils, make wood rapidly, and as quickly decay. Any one acquainted with the Alder knows that in wet situations, though it luxuriates in its young state, it seldom attains a medium size, or forty years' age, without indicating unmistakable signs of decay. The staghorn top, prematurely tinted leaves and dry branches, all show that something has occurred intercepting the flow of sap and vitiating its whole economy; and on investigation this is found to arise from the roots having lost their absorbing power through premature decay.

The Alder, therefore, in order to grow well and attain superior size and old age, should be planted upon dry soil of good quality in a sheltered rather than an exposed situation, under which circumstances it will attain its highest state of perfection, but may without breach of charity be suspected of heat rot in the lower part of the stem.

The Willow family is large, and its species probably the most accommodating of any trees. They grow in the wettest and also the driest of soils, in the arid land and marshy bog, on the bleak mountain top and sheltered valley. They may be grown as trees, or cultivated as bushes. They endure cutting or pruning to any extent, and submit to the roughest and rudest treatment with impunity. As a timber tree its best varieties even are unworthy of a site eligible for Oak, Elm, Spanish Chestnut, Ash, Beech, or Sycamore; not because its money value is less than that of many other species, but its roots decay at an early age, even on good soil. Consequently, as is almost universally the case, the Willow tree, instead of growing upright, is found in a reclining position, which greatly detracts from its beauty and symmetry. Willows are very tenacious of life, and very old specimen trees are to be met with all over the

country; and though, as already stated, the larger roots decay at a comparatively early period, another class soon take their place and fulfil their office.

The Poplar belongs also to a comparatively numerous family, and, like the Willow, is a succulent and rapid grower. Some varieties, as the Aspen and Grey Poplar, grow with considerable vigour on the bleak and barest situations; but the best tree varieties, as the Black Italian, White Egyptian, and Ontario, succeed only on good rich soils and in sheltered situations, and it is worse than folly to attempt to grow them on any other. A proprietor planted on Decade an extensive district of moorland with Poplar (chiefly Black Italian, I am informed), and, as might have been expected, they nearly all died—doubtless for want of nourishment, both of kind and quantity. While it is to be regretted that the excellent and enterprising proprietor thus suffered by the bold and noble experiment, the arboricultural profession will to that extent gain by it, for it is a noteworthy fact that most of us learn only that which we are compelled to learn, and take notice only of what is forced upon our vision.

The Laburnum is a tree peculiarly liable to root decay, and this is all the more to be regretted on account of its otherwise ornamental qualities. Economically, except for turning purposes, the Laburnum is of comparatively little value. Regarding it, however, as a tree of beauty, it has few, if any equals, especially on account of its graceful pendent, tasselled flowers, colour and perfume. No tree, whether great or small, sooner or more perfectly forms and matures its heartwood, which is dark-coloured, strong and durable. The roots also, like the stem and branches, mature their heartwood readily, but unlike the former soon decay, thereby allowing the tree to fall over in the opposite direction, in which it not unfrequently remains to old age. While the stronger and principal roots which constitute the anchorage of the tree thus readily give way, in their place and as substitutes for them, young ones are formed which, although they can neither elevate nor sustain the tree in position, yet supply it with nourishment to the full extent of its requirements, and by which it is maintained often to old age. The only practical means of partially preventing existing trees from giving way under their imperfect root-anchorage is to lighten their upper and heavy parts. This, however, does not by any means entirely prevent the occurrence, nor have I yet seen or heard of any thoroughly effective means of doing it.

The Walnut, like the Laburnum, is also very liable to lose its anchorage-roots, and partially fall over from the same or similar causes, namely, the roots decaying.

Probably the most effective means of preventing this loss of the vitality of their anchorage roots, would be in all cases to plant them upon artificial mounds or hillocks. This inference is drawn from what I once saw in a Larch plantation, formed upon pure peat soil, upon which the trees would not have remained sound to the age and size at which I saw them, but for the mound planting. At distances of 12 to 15 feet apart, clay had been wheeled upon planks upon the soft surface, and the trees planted, one upon each hillock. The results were, that the trees grew much faster and larger than those upon the flat surface; and when cut down, were perfectly sound in every part, root and stem, while the others on the flat surface were, many of them, worthlessly rotten at the root and lower part of the stem. *C. Y. Michie, Cullen House, Cullen, July 29.*

Apiary.

WORK FOR AUGUST.—It is a very needful caution to look out for robbers if your stocks are weak—bees belonging probably to your own apiary will be the chief robbers, although the worst thieves in many instances are wasps; if they once gain an entrance it is a very difficult matter to again drive them away. We were once asked to drive a few stocks owned by a widow lady, which were remarkably strong and active, at the early part of the season, but judge our astonishment when in the month of August we found every hive destroyed with wasps. There is only one remedy, though this is very successful if it is taken in time: make the entrance small, so that only two bees can pass and repass at the same moment. We always urge our bee-keeping friends every autumn to attend to this matter; a stitch in time saves nine. Many

valuable stocks might be saved by timely care; the bees are the best defenders of their own treasure, and if they are helped they will well repay it. The best thing we have known after years of experience is a small block of wood cut to exactly fit the entrance, with a small opening to admit two bees at its base. Some beekeepers employ zinc slides; we do not object to these, for anything will answer if it only makes the passage small enough.

Destroy every wasp's nest you find in the vicinity of your apiary. This may be performed with ease and safety. Pour a small quantity of turpentine into the entrance after they are all quiet some evening, then quickly stop up the open entrance, and you will find them all dead next morning, when you may dig out the combs, and if you are fond of fishing preserve them for this purpose.

Swarms having in many parts of the country been far from plentiful we would, especially just now, advise all our friends not to live every swarm, for probably we shall have them numerous this month. Second and third swarms, so-called, but which are merely casts, and not worthy of the name of swarm, should not be hived as separate swarms; but if it is wished to increase the stocks then hive two casts in the same hive, and afterwards feed them liberally. Many beekeepers hive every cast, then, leave them to their fate. In such cases we cannot but expect the almost inevitable result, for they seldom survive through the winter.

At this late season everything should be done to avoid swarming by giving the stocks plenty of room, though at times it is difficult to prevent swarming. Perhaps, all things considered, it is best to allow them to swarm, then either return them to the old stock or unite them to a weaker stock-hive which needs strengthening. *R.*

DRONES.—Your correspondent "K." takes me up too literally. In proposing that drones should be kept prisoners in a separate hive, I never meant that they should be kept under such conditions as were inconsistent with life. If apiarists are not sufficiently ingenious to be able to devise a means of ventilation, or whatever else is necessary for life, while still keeping them apart, they must be less fertile in resources than I had imagined. *Andrew Murray.*

Garden Operations.

PLANT HOUSES.

PLANT STOVE.—All the winter-flowering stove plants that are usually propagated from cuttings struck in the spring should now receive the attention they need, for upon being kept under such conditions as favour a strong sturdy growth will their ability to produce a maximum amount of bloom depend, much more than upon the mere size of the plants or the numbers grown. It is a very common occurrence whilst plants are small to forget the room they want when larger, and in this way it often happens in the spring that many more of these winter-flowering subjects are propagated and potted off than the space at command will admit of being grown without crowding to an extent that results in weak growth. Where this is the case it is far better now to go fearlessly to work and discard all that cannot be accommodated with enough room. The pits and frames that such plants generally occupy are very often of a character such as not to admit the full complement of light, and it should be borne in mind that these quick-growing subjects, such as under consideration, suffer to a far greater extent in an over-dark situation than plants of slower growth. Lean-to pits, such as are too frequently met with, with heavy back and front walls, and the surface on which the plants stand often consisting of a bed of ashes, or similar material, much too far from the glass, are about the worst structures that these plants can be grown in, though in many places they are all that are at command. Much may be done to benefit the plants by elevating them on temporary stages as near the glass as their heads will permit of. Every plant, however common or easily grown, should have enough room to stand clear of its neighbour. *Plumbago rosea*, *Sericographis Chiesbreghtii*, *Thysacanthus rutilans*, the taller-growing *Begonias*, *Scatellaria Mocinoana*, and any others that seem to require it, may have the points of their shoots once more pinched out, but this must not be done too late, or it will interfere with their flowering. Most of these winter blooming plants will be now getting their pots moderately filled with roots, and will be benefited by the frequent application of manure-water, through the use of which comparatively large plants may be grown in small pots, but where

this practice is carried out it should be remembered that it necessitates closer attention in giving water, as the greatly increased top-growth resulting, with the limited root-space to support it, causes the plants to become dry much oftener, and to suffer from the want of water. Should this occur to a much greater extent than where the amount of top-and-root growths is nearer proportionate—which will be the case where little or no liquid stimulants are used—less shading should now be given with more air, so as to solidify the growth during the process of its formation. On this important matter I frequently meet with what I consider to be an erroneous idea, that is, that where plants of a quick growing nature have been pushed along rapidly a disposition to bloom freely can afterwards be given by subjecting them, when grown to the size they are required, to a ripening process by giving less water with a much lower temperature; which is a mistake. Late struck Poinsettias should now be kept growing freely in a genial temperature, or they will not acquire strength to make useful flower heads. Plants of *Franciscia confertifolia* that flowered early in the spring and afterwards were transferred to the stove will now be about completing their growth; as soon as the flower-buds are perceptible in the points of the shoots the plants ought to be moved to cooler quarters, or, where it is desirable to bloom them later next year than they flowered this, they should be taken out of heat directly the shoots have completed their extension before the flower-buds are formed.

Ataccia cristata occupies little room, and its unaccountably singular chocolate inflorescences is always attractive. Plants that have flowered for two or three years, as their lower leaves decay, usually throw out a number of roots from the bare portion of the thick fleshy stem; if the head of the plant is severed an inch or so below where these are emitted, and is potted sufficiently low so as to cover the roots attached, in the course of a month it will get established. It must not have too much room, a 5 or 6-inch pot will be large enough, filling it one-fourth with drainage material; the soil should be open fibrous peat with a fifth or sixth of sand intermixed, and some broken crocks or charcoal added. The crown thus taken off should be covered with a propagating-glass, but not so as to wholly exclude air, or, from the succulent nature of the stems, there might be some danger of its damping. This is much the best method of increasing the plant, as after the head is removed the stool will break up a number of eyes, which can be taken off and struck separately. Flowering stove plants that have now been for some weeks stood in conservatories, and consequently subject to a lower temperature than where they have been grown, if indigenous to hot countries should from time to time be examined to see that they are taking no harm; if the young growths flag or the leaves become disfigured, it is an evidence that they will suffer. Where this is the case, they should at once be moved to warmer quarters. Much may be done to accommodate tender subjects when temporarily located in such quarters by regulating the admission of air in accordance with the outside temperature; frequently after thunder storms a day or two succeeds that renders a cool house quite unfit for stove plants, unless only a small amount of air is given. *T. Baines.*

ORCHIDS.—The fact that so few blooms are to be met with in these houses at the present time must be hailed as indicating that every endeavour must be made to forward and hasten on all the growths that are in various stages of development. When a quantity of blooms are open, and their rich and varied hues and delicious fragrance are making these structures gay and attractive, and causing many to visit them that would not in all probability do so if the flowers were absent, the treatment for many a day is in some degree more of a compromise than a regular and reasonable course; the fact being that in the endeavour to keep the blooms fresh as long as possible individual plants are often kept in a drier condition than they should be, and, providing blooming plants are taken into a cooler division, they often suffer on that account, for the change of temperature and atmospheric moisture is such that with many the root points close up again, the growth of the plants is checked, and on taking them back into their proper quarters, though they start growing again, they often take fir into the autumn and winter months before the growths are made up, and as a consequence are often imperfectly ripened. That this may be prevented as far as possible, see that the whole of the collection is now in a pushing and growing condition—of course a small number have already finished their growths and will not be included under this head; and that a regular and careful application of water is given to the roots, an advance of from 10° to 15° by sun-heat in the East India, *Dendrobium*, and *Cattleya* house being given; air on the top and bottom also must be freely admitted, using however some caution in this matter; and then in the afternoon, about 3 or 4 o'clock—in this being guided by the position of the houses—giving all a gentle sprinkle overhead as well also as among the lower parts of the *Aerides*, *Vandas*, *Saccolabiums*, &c.,

so that with the blinds drawn up and the ventilators closed the temperature may be raised a little by the sun heat, which will have a stimulating effect on all the plants. The temperature will gradually lower during the evening and night, and must be allowed to come down to the usual morning readings. Thus with judicious treatment growths will come freely on; but bear in mind that by taking off the blinds as soon as it can be done with safety, and at the same time letting the night temperature go gradually down, the growths will strengthen and plump out as they are made, and by-and-bye with a little more sunlight will be thoroughly ripened. With the *Odontoglossum* house, however, the method at present used in some respects be somewhat different; air must be given night and day—no fire-heat at present will be required, the object being to keep the temperature so that the range of night and day readings are not nearly so great as in the other houses; using moisture on the floors and stages, and with an abundant supply at the roots. By this means the heat must be kept down, otherwise the young shoots are liable to be attacked with the yellow trips, and then, through the foliage being weakened and bitten, the leaves are easily taken off with damp and rot, ultimately causing the young growths to be entirely lost. This house must have more shade than the other divisions, that the air may have the moisture retained and be less liable to fluctuations. *Masdevallias* must be stood in the coolest end of this house, and on no account be allowed to get dry. As a rule these are very free-growing, the chief conditions being that the soil should be sweet and open, the supply of water abundant, temperature very cool, and very little direct sunlight. *Sophranitis grandiflora* on blocks in this house will now require a little extra looking to, the young breaks with the flower-buds enclosed in them will be pushing up, and when the blocks are dipped the water must not be permitted to remain in the breaks, otherwise the tender buds are very liable to damp off. *W. Swan, Fallowfield.*

FLOWER GARDEN, ETC.

The beds are now well filled and in the height of their beauty. Where any of the stronger growers are getting out of their places, or showing a tendency to become too thick and crowded, they had better be cut back or the points of the shoots pinched out. Wherever cuttings can be had without in the least interfering with the appearance of the beds they may be put in at any time now. We generally commence with the variegated *Pelargoniums*, as they require longer time than the scarlets and stronger-growing sorts. All ours are struck in an open exposure in the full sun, and get very little water until the cuttings are rooted and growing. *Phloxes*, *Pentstemons*, and other choice hardy plants may be propagated in handlights or glasses on a shady border or in any convenient place; *China Roses* also do well treated in the same way. *Clives* and border *Carnations* had better be layered without delay, in order to get the plants well established before the season gets too far advanced. Proceed with the budding of *Roses* as the Briers get ready; attend to tying and nailing climbing plants as they advance; those requiring sticks and supports should be looked to before they get broken over. The late showers are bringing up weeds in all directions, lose no opportunity of having them kept under. Let the walks be picked over, swept, and rolled, to keep them smooth and firm. The lawn will also require frequent mowing and sweeping to keep it always in first-rate trim. *T. Blair, Shrubland Park.*

FRUIT HOUSES.

STRAWBERRIES IN POTS.—In this department, at this season, active operations will be required in the way of potting up those plants which are to be prepared for forcing purposes, and also in planting out others which are intended to form new plantations on open quarters or elsewhere. It is very desirable to have both these matters accomplished as expeditiously as possible after the layers are rooted and fit for such operation, and at this time other superfluous runners should also be removed from the plants; these means, which are of considerable importance in connection with the subject, will tend to concentrate the full force of the plant towards the development of leaves and formation of crowns for giving another year's supply of fruit. It is also highly essential to retain every leaf on the plant until its proper functions are fulfilled, instead of pursuing the barbarous practice, which is still indulged in at some places, of trimming up those plants, and exposing the surface roots to an arid and parching state, to their entire detriment. In potting use lumpy soil which has been moderately enriched with decomposed manure, free from worms, or that from spent Mushroom beds is very suitable. Have the pots made clean inside, and let them be well drained: 5-inch ones are most suitable for general purposes, but exception may be made in the case of such sorts, for instance, as *Black Prince*, which are required for very early work; 4-inch ones will suffice, or larger ones may with propriety be used for large-growing kinds

which are intended for late work. As the potting proceeds let the plant be well watered at once, after which give no more water until the soil becomes dry. A little extra care in this matter until the roots have taken hold of the fresh soil is advisable, as the plants are liable to become too much saturated if indiscriminate waterings are persisted in. Eventually such plants will require copious supplies of water, it will therefore be prudent, if possible, to select a place suitably located for this purpose. With reference to making new plantations of these plants, by all means give them a good place and well-enriched soil, and allow ample space between the rows, so as to admit of a perfect development of the foliage and runners. We make the rows 3 feet apart, and plant 18 inches asunder, and on dry and exposed quarters or borders mulch the surface of the ground with about 2 inches of manure as soon as possible afterwards. *G. T. Miles, Wycombe Abbey.*

HARDY FRUIT GARDEN.

Excepting Peaches and Nectarines that suffered such a severe check through having their leaves so blistered, all fruit trees are showing a remarkable redundancy of growth, which in the case of those on walls needs frequent regulating and nailing or tying-in to prevent the wind acting on the branches and tearing them down. As there is now no fear of any of the back buds starting, all breast-wood should be kept stopped close so as to let in plenty of light and air about the spurs, and thus insure a thorough ripening of the same, which from the gross sappy state of most of the shoots will require all the assistance it is possible to give them. There is no fruit that is so much benefited and improved in flavour by exposure to sun as the Fig, and as these will now be approaching the ripening period, all superfluous wood should at once be cut away, and particularly that from the inside of the tree, or such as is coarse and long-jointed, as this rarely ripens or becomes sufficiently firm to stand through the severity of winter, and even should it do so is never productive. There is an old saying that a pruned Fig never bears, but that only applies when the pruning is confined to the top, and when it is done at an improper time, as would be the case after the leaves have fallen, as then they only grow the stronger during the following year unless a corresponding shortening of the roots should take place at the same time. Whenever Figs require the aid of a knife they should have it at this season, as it affords a salutary check by removing a portion of the foliage, and from letting in light and air helps to consolidate and harden the wood, thus rendering it more fruitful. Autumn-bearing Raspberries, always so useful, will be doubly valuable now that there is such a scarcity of Plums for culinary purposes, and, therefore, special attention should be paid them to induce as heavy a crop as possible, and to prolong their bearing as late as the season and the nature of the soil will permit. The best way to treat them is to mulch the ground heavily over with half-rotten manure, and then give a thorough good soaking of water, repeating the same if the weather sets in dry, and renders such a course necessary or desirable. In seasons like the present, with plenty of rain to force growth, it often occurs that the young suckers from the summer-bearing kinds break and bear fruit, as they are now doing with us, and come in most acceptable for dessert, as the berries are large and fine. It will be well, therefore, to look over plantations, and stake and tie up any showing this tendency, previous to which, however, all old canes should be cleared away, that the sun and air may have full play amongst them. Morello Cherries are not generally looked on as dessert fruit, but if allowed to hang till October they lose much of their acidity, and are then quite an acquisition at table. To keep them, however, till that time they must be closely netted up, as blackbirds have a special liking for them, and are most persevering in their efforts to get at them, and if the trees happen to be in a quiet, unfrequented part of the garden, they often clear off the crop without being observed. The most secure protection for these and Currants on walls is Haythorn's hexagon net, which will effectually keep off both birds and wasps. Fortunately the latter are not likely to be much trouble this season, for up to the present, I have not seen any about since the queens made their appearance in May. It is the practice with many to use mats to envelope their bushes of both Gooseberries and Currants, but from the way they exclude both light and air, the fruit soon deteriorates, and does not keep nearly so long as when it is more fully exposed, as then it dries quickly and rather improves by hanging than otherwise. As the kernels of Filberts are now swelling fast and filling their shells, a close watch should be kept for squirrels, or those active little rovers will soon strip off the crop, for, not content with appeasing their appetite and trusting the morrow to provide for itself, they garner up stores and thus look out for the rainy day. One hardly likes to shoot them, and yet that is the only course, as they are not intimidated by blank cartridge or any other device. *J. Sheppard, Wootton Bassett.*

THE

Gardeners' Chronicle.

SATURDAY, AUGUST 11, 1877.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, Aug. 14	—Clay Cross Horticultural Society's Show. Floral and Fruit Exhibition at Dover.
WEDNESDAY, Aug. 15	—Glamorganshire Horticultural Society's Show. Shropshire Floral and Horticultural Society's Show (two days).
FRIDAY, Aug. 17	—Norton Horticultural Society's Show.

SELDOM has it been our lot to chronicle a fruit report of more uniform character than that which now we lay before our readers by the courtesy of our numerous correspondents throughout the British isles. Unfortunately the uniformity may too often be described as uniformly bad. Neither latitude, nor protection, nor soil, nor elevation, seems, speaking generally, to have availed aught in securing a crop of fruit.

Apricots were almost uniformly below average, and in some cases utter failures. Two exceptions may be noted in Sussex and Herefordshire respectively, which lead to the inference that the localities in question are in some way specially protected from the onslaught of spring frost.

Plums are almost invariably much below an average, and may generally be registered as an utter failure—a striking proof of the inclemency of the flowering season. In one part of Kent, Victoria and Prince of Wales have done something to redeem the general disaster, and the loyalty of Plum growers is likely thereby to be enhanced.

Cherries were generally under the average, with the exception of Morellos, of which in many places the crop is reported to have been good.

Peaches and Nectarines, as might be predicted, are almost non-existent.

Apples in by far the large majority of cases are below average; in a few cases they are spoken of as average, while in certain localities in Lancashire, Buckinghamshire, Suffolk, and Sussex the crop is recorded as over-average. In those fruit orchards and gardens we have ourselves seen, while tree after tree is destitute, or nearly so, of fruit, here and there a particular tree is heavily laden. This seeming capriciousness is doubtless primarily dependent on the variety of Apple rather than on climate or soil.

Insect agency has so much to do with the setting of the fruit that it must not be overlooked that it is not the direct influence of untoward climate that has to be looked to, but also the effect of cold and wet in keeping insects at home.

Turning to small fruits, such as Currants, Gooseberries, and Strawberries, a different tale is told. The crop of these fruits has in general been large. Probably their blossoms were later in developing, and of necessity less exposed to the inclemencies of the weather. Nuts again are generally abundant, and in Kent, Surrey, and other southern counties, as also in the West, promise an abundant crop. The period of blooming, as well as the structure of the fruit, may perhaps account for this. The pollen, too, of such plants being carried by the wind, to a large extent, would render them to that degree independent of the agency of insects. Fortunately if our own supplies run short America and France will be able to help us.

It may be interesting to notice that good fruit years are the exception rather than the rule. Thus, taking the record from 1870 till the present time, we find that in 1870 the crop was generally speaking abundant; in 1871 scanty and late; in 1872 a complete failure; in 1873 it was under average; in 1874 it was reported to be average; in 1875 unusually abundant; in 1876

very unsatisfactory, while the wet autumn of last year, and the cruel spring of the present, has rendered the season of 1877 the worst of the series.

We have not of late heard much of the importation of tinned Cranberries from America, of which we had the opportunity of tasting some excellent samples a few years back—so excellent that we have been looking forward to their further importation. But our friends across the Atlantic have their woes as well as we, and the Cranberry submitted to cultivation is apt to suffer from disease, from which in a wild state, if not entirely free, it is relatively exempt. One source of consolation we may make the best of, and that is that the trees will have a season of fallow this year, which should give them a better chance next; and for the rest we may do worse than imitate the good humour of our correspondent in last week's issue who described the state of his fruit garden in such amusing terms.

— For the photograph from which our illustration (fig. 33), p. 177, was taken, we are indebted to Prince PIERRE TROUBETZKOY. The plant represented is AGAVE SALMIANA, which has flowered in the Prince's garden at Intra, on the shores of the Lago Maggiore, without any protection. The plant was planted out in 1871, when not more than 18 or 19 inches in height; its present dimensions are:—flower-stem, 6.10 metres (about 20 feet) in height; circumference of flower-stem, 64 centimetres (= 2 feet); length of leaves, 1.70 by 30 c.m. in width. The circumference of the entire plant measures 50 metres. The flowers were fertilised with the pollen of *A. Celsiana*, *A. maculata*, and *A. xalapensis*, and the woodcut shows the process—about the first time, we suppose, that the marriage ceremonial has been thus represented. The flower-bud was first noticed in the beginning of February, and on July 5 the flower-stem measured 6.10 metres (= 20 feet, about), and all the flowers were then expanded. In the same garden are now in flower *Dasyliroon gracilis*, *tenuifolia*, *Beaucarnea*. *Beschornera mexicana* and *californica* are in flower, the flower-stems being of a coral-rose colour with green bell-shaped flowers. Twenty-five varieties of *Eucalyptus* are also grown, some of which, as *E. amygdalinus*, have in eight years attained a height of 15 metres (= 49 feet) from the seedling stage, the trunks being now 1 metre 25 in circumference at 3 feet from the ground.

— With reference to the forthcoming INTERNATIONAL FRUIT AND FLOWER SHOW, to be held at Carlisle, we are glad to learn that Lady MUSGRAVE, Eden Hall, has in the most handsome manner increased the prize offered by her ladyship for table decorations, and will present a most beautiful cup, valued at £25, to the successful competitor. The latest date for entries is now extended to August 30, and we have no doubt there will be a keen competition. The following ladies have very kindly agreed to act as judges:—Lady MUSGRAVE, Eden Hall; Lady LAWSON, Brayton; Mrs. PERCY WYNDHAM, Isel Hall. The many attractions of this great show will be still further increased by the presence during three days of the splendid band of the 2d Life Guards, by permission of Colonel A. C. H. STEWART.

— We are informed that at a meeting of the committee of the NATIONAL ROSE SOCIETY, held at the Horticultural Club on Tuesday, it was determined to publish in or about November a Rosarian's Year-Book exclusively devoted to the Rose, and to contain a full report of the great show at St. James' Hall, to be issued free to members—price to non-members, 1s. Suggestions were made as to holding two shows—one in London and one in the provinces.

— A *resumé* of the proceedings of the AGRICULTURAL SOCIETY OF MADRAS from 1835—1870 has lately been issued by the Society, and is an interesting document from the numerous entries relating to WALLICH, WIGHT, GRIFFITH, CLEGHORN, MUNRO, and other botanists.

— Among other signs of rejuvenescence in the ROYAL HORTICULTURAL SOCIETY we may mention the reappearance of the JOURNAL of the Society, under the editorship of Mr. ANDREW MURRAY, who

has been appointed "scientific director of the Society." The part before us is a slim octavo of a single sheet, and is almost entirely taken up with Mr. MURRAY's papers on the flow of the sap. A portion of the report of the Floral Committee on the bedding *Pelargonium* grown for comparison at Chiswick in 1876 is also given. We infer that it is intended to bring out a monthly part, though nothing is said directly on the subject. Perhaps the present sheet is published tentatively, and upon the way in which it is received by the Fellows will depend the future mode of publication. We believe that recent volumes of the *Journal*, though well edited and by no means unimportant as to their contents, were so little appreciated by the Fellows that an infinitesimally small number was applied for. We sincerely hope that a wider interest may be taken in the present series. On the cover we notice also some announcements by the Council, which show that an attempt is to be made to revive the 3 o'clock meetings, and to this end we notice that Mr. MURRAY has undertaken to treat of the subject of Silver Firs on the 21st inst., having discoursed on the red-spider on Tuesday last.

— On the subject of making SELECTIONS OF FRUIT TREES for culture in any particular locality Mr. FARQUHAR, of Fyvie, Aberdeen, writes:—"Young gardeners in making a selection of fruit trees would find it more to their advantage to study the hardy sorts suited to the locality (more particularly in the North of Scotland), than the choice sorts frequently recommended for variety. This season I find trees of the more common sorts with a good crop, while many others have nothing."

— The remaining parts of PRITZEL'S THESAURUS LITERATURE BOTANICÆ have lately been published by BROCKHAUS, of Leipsic. It may be remembered that Dr. PRITZEL died in 1874, before the second edition of his valuable catalogue was completed. Dr. CHARLES JESSEN has undertaken the laborious task of completing the volume, and the result of his labours is now before us. The concluding portion now issued contains lists of the several botanical books arranged under various headings, such as general botany, books in various languages, monographs of particular families, garden catalogues, geographical botany, fossil botany, floras of various countries, economic botany, physiological botany, indexes, &c. Working botanists will be so glad to get the book in a complete state that they will not be too exacting, albeit it seems to offer numerous occasions for adverse criticism; but, as we have said, errors of commission and omission will readily be condoned.

— At a meeting of the Central Horticultural Society of France M. ALPHONSE LAVALLÉE showed fruiting specimens of NUTTALLIA CERASIFORMIS. As the name implies the fruits are like those of a Cherry, the colour yellow passing into reddish violet. In flavour they are acidulous and agreeable. This beautiful spring flowering shrub is not known as its merits deserve. It used to form a conspicuous object in the Wilderness Walk at Chiswick, unhappily lost to the Society. We never heard of its fruiting in this country.

— We hear that it is proposed to open the charming gardens at HECKFIELD PLACE under the customary conditions on Monday, the 27th inst., and five following days, instead of on successive Mondays, as has been the case in previous years. Lord EVERSLEY'S kindness in this respect is so highly appreciated that the usual opportunity to inspect the gardens is looked for with great interest in the surrounding locality. Visitors will find the bedding this year to be greatly varied in character, and as perfect and beautiful as ever—indeed, not only the bedding, but the entire place seems to grow in beauty. The recent rains have left the extensive undulating lawns in dense verdure clad, and the whole place is as neat as the proverbial new pin. The Grapes are superb, and well maintain Heckfield's old reputation.

— The MARQUIS OF BUTE'S VINEYARD AT CASTLE COCHI, near Cardiff, which has acquired something more than a local reputation, is just now looking remarkably well, and there is the promise of a very fair crop of fruits, the age of the Vines considered. The plants now average 3 to 4 feet in height, each has put forth from three to five strong shoots, and the most vigorous plants have from six to seven good bunches. The growth of the Vine is something

FIG. 33.—FLOWERING PLANT OF AGAVE SALMIANA IN THE GARDEN OF PRINCE TROUBETZKOV.

remarkable; the leaves are large in size, and as healthy and clean as any one could well desire to see them; there is not a trace of mildew or insect pests of any kind. The few Vines that carried fruit last year ripened their bunches thoroughly, and Mr. A. PERTIGREW, the gardener at Cardiff Castle, who takes a great interest in the experiment, is very sanguine as to the crop of fruit likely to be harvested this season. The Marquis of BUTE is so much encouraged in the matter that a considerable portion of land has been planted during the past winter, and it is computed that the vineyard now comprises some 6000 Vines. Mons. CHAVENET, the proprietor of a large vintage at Côte d'Or, in the South of France, called at Bute Castle a few days ago, and expressed himself in sanguine terms as to the ultimate success of the experiment. He is sending a further supply of Vines for planting out at the proper season. The soil is kept gently hoed on the surface; it is so full of fibrous roots that it cannot be deeply moved without risk of injury. A good mulching of manure will be given in autumn, and each leading shoot will be cut back to three eyes at the proper time.

— Our enterprising contemporary and for so long a time our associate—the *Agricultural Gazette*, will publish in its next number a coloured illustration of the COLORADO BEETLE in its various stages. In reference to this subject we may mention that there are now so many illustrations of the Colorado beetle that we trust our friends will not send us so many lady-birds! It is a great pity people do not know friend from foe.

— The PELARGONIUM SOCIETY has just issued its report and balance-sheet for 1876-7, from which it appears that the annual subscriptions amounted to £88 12s.; that the amount of prize-money distributed amongst the various exhibitors on June 19 was £87 2s. 6d.; and the Society has a balance in hand of £42 6s. 5d. The annual meeting takes place at Chiswick on the 15th inst. at noon, when the arrangements for the ensuing year will be discussed.

— On Monday last (Bank Holiday) no less than 58,000 persons visited the Royal Gardens, Kew, between 1 P.M. and sunset.

— Judging of what we have seen in various places THE BALSAM does not prove ornamental in the open ground when grown on in pits and then turned out with balls of soil. The result would appear to be the undue development of side shoots and foliage that retard the production of flower and cover up the fine blooms that are first obtained on the centre stem. On the other hand, plants taken from the seed bed and dibbled out into the open ground soon produce flowers with but few side shoots, and the floral beauties of the plants are thus seen to the best advantage. Where seed is desired the soil should not be too rich; when necessary the plants should be stopped, and, if found needful, some of the side shoots should be taken out. Thus grown we have found the Balsam to be extremely beautiful in the open ground, and well worthy to be classed as a bedding plant.

— Paragraphs have been going the round of the papers relating to the FLORAL DECORATIONS on the occasion of a grand reception on the part of Madame MACMAHON, and also on the costliness of modern entertainments in London. We are informed that at a ball in Belgrave Square on the 9th ult. Mr. WILLS supplied and arranged in one day 59 large Palms, Dracenas, &c., from 12 to 20 feet high, including many splendid specimens of *Cocos flexuosa*, 15 feet high; 60 Palms, from 6 to 15 feet high; 188 various Palms and foliage plants, from 4 to 10 feet high; 1 extra large *Seaforthia elegans*, 25 feet high; 292 foliage plants and Palms, from 3 to 6 feet high; 10 large *Phormium tenax*, 6 by 10 feet; 107 plants of WILLS' new hybrid *Dracenas*, from 3 to 5 feet; 72 large Ferns, from 3 to 7 feet high; 84 *Cyperus*, various, 683 Creeping Jeony (*Lysimachia*), 2880 *Lycopodium denticulatum*, 84 handsome foliaged *Begonias*, 209 *Adiantum cuneatum*, 109 *A. farleyense*, 50 *Sedums*, 50 *Panicum variegatum*, 60 large *Ivies* in pots, 10 feet high, 20 *Cocos Weddelliana* for centre of refreshment tables; 1416 choice flowering plants, 150 handsome *Lilliums* (specimens), 72 *Crassula coccinea* (specimens), 48 choice *Orchids*, &c., 72 *Isolepis gracilis*, 72 *Tradescantias*, 150 various

creeping and trailing plants; total, 7271 plants, 72 spikes *Tuberoses*, handsome; 6500 cut *Roses*, *Stephanotis*, cut *Orchids*, &c.; 22 tons of clear block ice, 5 tons of Derbyshire spar, 1 ton of virgin cork bark, 4 vanloads of green moss (equal to 1200 bunches). Large grates were constructed, water for fountains, waterfalls, &c., laid on. The total cost of the above considerably exceeded £1000. Thus it will be seen that the cost of such entertainments has been much underrated by the general press. Of the taste and good sense that prompts such lavish expenditure we say nothing.

— The twenty-second autumn exhibition of fruit and cut flowers at the Crystal Palace is announced to be held on September 21 and 22.

— In reply to very numerous and still-continued enquiries, we beg to repeat that the ROSE SUPPLEMENT, with the coloured plate, presented to our subscribers with the number for July 7, is out of print, and will not be reprinted. We shall shortly issue a coloured plate of fruit, of which due notice will be given.

— True DICHOTOMY, or forking of the growing point in flowering plants, is sufficiently uncommon to make it worth noticing that numerous specimens of the American Waterweed (*Elodea canadensis*) recently examined presented this peculiarity. Though rare in flowering plants, it is the common mode of division in *Cryptogams*.

— Adverting to paragraphs in recent issues relating to certain alleged malpractices at ORCHID SALES we have received the following communication from Mr. STEVENS, who has also made known to us the facts of the cases alluded to by our correspondents so far as he knew them or was concerned with them as auctioneer. It is only just to Mr. STEVENS to state that not one of the correspondents who has addressed us on the subject has cast the slightest imputation on the good faith and upright conduct of Mr. STEVENS, which is indeed evidenced by his letter. Mr. STEVENS writes:—

"I have read the correspondence and your editorial note of last week, on the subject of Orchid sales, and need hardly say that it is not only my wish but that it is greatly to my interest that my sales should be conducted in a fair and honourable manner, and that buyers should be able to rely upon the correct description of the plants which come under my hammer. At the same time it would be quite impossible for me either personally to examine and guarantee the thousands of plants which annually pass through my hands. Orchid growers are aware of the great difficulty in describing many of the species, and that they pay a price at auctions commensurate with the risk. But I shall always be glad to assist purchasers in obtaining redress from the vendors where there is just cause for complaint, and shall feel grateful to any gentleman who will draw my attention, either publicly or privately at the time of sale, to any plants about which he may have reason to suppose there can be a doubt."

— The Messrs. SUTTON are to be congratulated that whilst the Hollyhock fungus is working so much mischief in other places they are fortunate enough to have in their nursery a very fine plantation of this grand border flower, all the plants of which are in rude health and full of vigour. The varieties grown include all hues of colour found in the Hollyhock, and the flowers are of superb quality. Spring propagation, a deeply-worked soil, plenty of manure and room, seem to present the elements of successful culture.

A GARDEN LOUNGE.

THE figure we give of a garden lounge may be useful, as it is easily made, is inexpensive, and readily adapted to the varying requirements of young and old, short or tall. The back, as will be seen (fig. 34), can be raised or lowered at will, and the foot-board can, by an arrangement of pegs, be adapted to the comfort of the lounge. The back measures 30 by 19 inches, the length of the seat 19 inches, of the leg-rest 15 inches, of the movable foot-board 8 inches. The extreme measurements of the supporting framework are from the front of the seat to the end of the supports in front, 27 inches, and from the front of the seat to the end of the supports behind, 44 inches. We are indebted to Mr. W. Earley, Valentines, for the sketch and measurements of this very convenient garden seat.

FUNGOID DISEASES OF FOREST TREES.

BY M. C. COOKE, M.A., LL.D., &c.

EXPERIENCE has taught us that fungi may exercise an injurious influence in at least three different directions, viz. (1), either by permeating the soil, and injuring or destroying the roots, or (2), by establishing themselves in the tissues of the plant, and developing themselves outwards as true endophytes; or (3), by a kind of external parasitism, more or less covering the leaves and young branches, choking the stoomata, checking growth, destroying the healthy functions, and ultimately causing death. These three modes of attack suggest the classing of our remarks under the heads of (1), root fungi, (2), Endophytes, and (3), Epiphytes.

ROOT FUNGI.—Horticulturists and foresters in Britain have long recognised the secret but deleterious influences of root fungi, as evidenced by the numerous and oft-repeated complaints which have appeared from time to time, over a period of many years, in the pages of the *Gardeners' Chronicle* and other journals devoted to horticulture. Vines have been described as suffering from attacks of root fungi. Shrubs withering and dying beneath the insidious attacks of fungi at roots, and whole plantations of young trees being cut off by some unseen destroyer, which at length was discovered in the soil. Hundreds of instances are on record to substantiate the fact that conditions of fungi, mostly in the state of mycelium, or root-like threads and fibrils, can and do permeate the soil, and injure or destroy growing plants to a considerable extent. There is no external appearance of this enemy manifest, until the condition of the plant itself gives indication that something is going wrong. It is only by breaking and turning the soil that the cause is revealed, and it happens not unfrequently that the unaided eye is insufficient to detect its presence. Causes and cure are alike too little within the scope of human control.

Fungi of the Mushroom type are known to be developed from a mass of delicate fibrils which penetrate and interlace the soil, and to this filamentous material, which to fungologists is known by the name of mycelium, the common name of "spawn" is applied. It is just this kind of substance which accomplishes all the mischief comprised under the term of "root fungi." It is not a complete and perfect fungus, but the "mycelium" or "spawn" of some such fungus as an *Agaric*, a species of *Polyporus* or some *Thelephora*. This kind of mycelium, or incipient fungus, is almost certain of development from rotting wood, dying leaves, or vegetable matter of any kind during decomposition. Hence all soil containing vegetable substances in a state of decay contains the elements of root fungi. This may be illustrated by two or three recorded instances. Two *Deodars* were planted near the Director's house at the Royal Gardens at Kew, one grew, the other did not, and it was afterwards discovered that where the latter had been planted an old *Cherry* tree had been cut down; the inference was that the fungi on the dead wood left had attacked the living roots of the *Deodar*, causing the tree to fall into ill health. This was adduced as the true explanation why one tree often refuses to grow where another had stood before.*

A fine *Wellingtonia gigantea*, standing in the grounds of Portnall Park, was destroyed, and afterwards the cause of death investigated. A sickly hue spread over the branches, all that skill and intelligence could devise was done for it, but alas! its doom was fixed, and in a short time this much-cherished favourite was a dried stick. Fungous spawn had penetrated every part of its system, a white kind of network was found under the bark of all its roots, and it was believed that the enemy was some species of *Polyporus* or *Thelephora*, in the mycelioid condition. In commenting upon this incident the Rev. M. J. Berkeley remarks that he had a noble *Cypripedium macropoda* affected in the same way. He recommended that in planting on the same spot it would be prudent to trench the ground deeply, and get out, if possible, every fibre of the deep roots, as each fragment might be affected, and would perhaps propagate the mischief, even if the new tree were planted at some distance.†

Shortly after the above was recorded another instance appeared in the same journal. The writer says that early in the year (1865) he had some hundreds

* *Gardeners' Chronicle*, 1865, p. 462. † *ib.*, p. 1037.

of Conifers, which he noticed were rapidly losing health, and assuming a sickly hue, which steadily increased. He saw that they were attacked by fungi, and that some means must at once be taken to check the evil. Many of the plants were 11 and 12 feet in height. The greater part of them consisted of Deodars, *Pinus excelsa*, *Abies Douglasii*, *A. Menziesii*, and *Cupressus Lawsoniana*. The remainder were *Wellingtonias*, *Abies Webbiana*, *A. Morinda*, *Arbovitæ*, &c. All were planted in a nursery, the soil of which was for the most part about one-half shingle, and the subsoil entirely of that description. He had all the plants taken up, and every particle of soil shaken from their roots. He found that every plant was attacked by fungi, and that most of them had lost at least two thirds of their roots, which were entirely covered with and penetrated by minute thread-like processes, forming a thick network all over them, sometimes, indeed, assuming the appearance of small lumps of spawn. After the plants were taken up he had the roots well washed in pure water until not a particle of spawn could be seen on them, what were left were then cut back to 3 or 4 inches beyond the decayed parts. On examining the soil in which the trees had been planted he found partially decayed leaves and small pieces of decayed wood, which were doubtless the cause of the mischief. Leaf-mould had been applied to give the plants a start, which, however, as has been seen, was in the wrong direction,

only plan likely to succeed is to lift the trees carefully and prune away every diseased root. We have known this treatment successful, and can suggest no other.

There is little doubt that a large portion of the Larch rot is due to this cause, and we have been informed by an extensive forest owner in Scotland that after a plantation of Scotch Fir is cut down it is useless replanting it till the ground is covered with strong heather, by which time the old roots have lost their power of mischief. In this, as in many other instances, prevention is much easier than the cure. If trees must be planted where others have preceded them there is little chance of success except the ground is deeply trenched and every root removed.*

It will probably be urged that, on forest land, and especially in tropical countries, it is impracticable to suggest clearing the soil of old roots, stumps, and decaying vegetable matter. That it has always been the practice to leave all this kind of *débris* to rot and decay in the ground, and that, upon the whole, it does not prove deleterious. That Coffee is constantly planted on such roughly-cleared forest land, with the rotting stumps left, and the soil covered with rotting twigs. And yet Coffee plantations flourish, and nurseries of forest trees succeed under such conditions. It may be so, but the danger always exists, and if any temporary weakness or sickness should fall upon such a plantation, root fungi will then seize upon the

mass of snow with fungus spawn. Its origin was traced to some staves of a wooden tub which had been left in the border. The roots of Oranges, Camellias, Acacias, Clethras, and Neriums, literally crumbled to pieces on being touched.*

Knowing what an insidious foe we have to deal with in this kind of fungoid disease, it is not unnatural that we should sometimes suspect that in Tea plantations and in Coffee plantations, as well as in nurseries of forest trees, this enemy has been the secret cause of much mischief in the past, and that too little attention has been applied in this direction. Having now pointed out what to us appears to be a grave source of danger, we must leave the suggestions with forest officers to apply them in their own individual cases, and satisfy themselves that this form of disease is, or is not, one which affects them, or the districts under their care.

Endophytes are fungi which enter by any means into the substance of young and growing plants, and develop themselves outwardly, by bursting through the cuticle of the leaves and young branches, when they become prominent objects, distorting, and at length killing, the trees, or at least stunting and deforming them. Of this class are the species of *Peridermium* which attack the leaves and young branches of Conifers—or rather it should be said they burst through and develop themselves on the leaves and twigs, scattering abroad their myriad spores in a yellow or orange-coloured dust. Such also are the species of *Podisoma* which cause gouty swellings of the branches of Junipers and Cypresses, and burst through the bark in gelatinous orange or brown protuberances. At a future time it may prove advantageous if we enter more into the details of this class of parasites, and especially as to their structure, mode of development, and reproduction, and such suggestions as may, from time to time, offer themselves as helps towards their eradication.

Epiphytes are those fungi which, by spreading over the surface of the leaves and other green parts of growing plants, choke up the stomata, check all transpiration, and literally choke the plants to death. These fungi attack evergreen and deciduous trees alike, and are not less deleterious in their influences than the last-named kind. Some have a glaucous, whitish, or mouldy appearance, as the numerous species of *Erysiphe*; whilst others are almost black, resembling a coating of soot, as the species of *Capnodium asterina*, *Meliola*, &c., and these like the former must receive special illustration.

Finally, it may be permitted us to suggest that, in order to render our further remarks and illustrations of these parasites as complete and practical as possible, it would be of considerable assistance if forest officers in all parts of India would kindly collect and forward to us, through the Inspector-General, specimens of leaves and twigs of trees of all kinds which come under their knowledge which are affected or injured by parasitic fungi. In all instances the botanical name of the tree, locality, and date, should be attached. *Indian Forester*.

Home Correspondence.

The *Hydrangea* for Market Purposes.—As shown this season at South Kensington in such perfection by the growers for market this is one of the decorative plants that is seen in greater perfection in London than in any other locality. Its large showy heads of flowers, grown in such small pots, are a surprise to country visitors. Like the other plants that the London grower takes in hand, it receives the greatest attention in all its stages of growth. It is nearly hardy in most of the southern counties, but when grown for decorative purposes it is treated as a half hardy plant, and carefully protected from frost. Now we have the fine white one added to the pink and blue, they give us three very useful colours for ordinary decoration, which every person can possess by striking a few plants every spring. The first batch of store and flowering plants are put into a moderate heat the beginning of January. As soon as the cuttings are ready they are taken off and propagated. All the side shoots and suckers are taken off the flowering plants for cuttings. This is continued all the season with each succeeding batch of plants. As soon as the cuttings are well rooted they are potted into 2½-inch pots in a good loamy soil, with a little manure and sand added. As soon as these pots are well filled with roots, they are potted into 4-inch pots, using the same compost; they may receive another shift by-and-bye, but the 4-inch pot is the

FIG. 34—GARDEN LOUNGE. (SEE P. 178)

Every leaf and bit of wood was the nucleus of disease. He was compelled to plant again in the same ground, after removing the soil and putting maiden loam in its place. Trenches were opened and the plants were well puddled in, and staked in cases where they required such support. Some 1000 plants were treated in this manner, to which was added syringing morning and evening in very hot weather. The loss was less than 1 per cent. The plants were lifted and replanted at the latter end of March.*

This and similar instances induced some remarks by the Rev. M. J. Berkeley on the subject, and it must be remembered that this gentleman speaks with the experience of nearly half a century largely devoted to the diseases of plants, especially of a fungoid character, and their antidotes. He wrote:—"Every day proves more clearly what great caution ought to be exercised in planting on ground which has formerly been occupied by trees. A few sceptical remarks are occasionally heard, leaning simply on mere negatives, but the positive proofs are too numerous and stringent to leave any room for doubt. We have now before us a portion of the roots of a *Wellingtonia*, which were in close proximity to an old decayed post, and are now densely clothed with fungus spawn, which is rapidly destroying the tree, one of an avenue of 160, and fears are entertained that the rest will suffer. Different remedies have been tried without success, and we feel convinced that any chemical which could reach the diseased roots through the soil would soon destroy those roots which still remain sound. The

weakened roots, and demonstrate their presence and their power.

In the majority of cases recorded, in which death or disease has been caused by root fungi, the suffering trees have belonged to the Coniferae, but they are by no means the only kind of tree subject to similar attacks. We have before us a record of a Green Gage tree which died, and was succeeded by a Peach tree, which grew with the utmost luxuriance, but at once withered from the contact of the old roots. The ground was then most carefully trenched, but apparently not far enough, as a scarlet-flowered Chestnut, which was planted within their reach, and which for two years flowered well, though it was only a seedling of four or five years old, after flowering in 1866 caused great surprise by dying suddenly. The roots, even the merest fibres, on examination were found covered with spawn which had run between the bark and the wood, and formed a white film. It is probable that the enemy was the mycelium of *Poly-porus igneus*, which is white, but it is very rarely that an opportunity occurs of ascertaining to what species the destructive mycelium belongs.†

Another instance is recorded of the examination of the border of a conservatory, the sickly appearance of the vegetation planted therein having indicated something wrong. The soil from 2 inches to 1 foot in depth below the surface was found to be like a

* *Gardeners' Chronicle*, 1865, p. 1153. [This may be true in some cases, especially when the locality is not suited to the species, but it will certainly not hold good in the general form here given. *The Editor*, "*Indian Forester*."]† *Gardeners' Chronicle*, 1866, p. 1017.

* *Gardeners' Chronicle*, 1865, p. 1061.

* *Gardeners' Chronicle*, 1867, p. 105.

preferable size for market purposes, and its producing power is wonderful. As soon as well established and carefully hardened off, they are plunged out-of-doors in an open situation in prepared beds of coal-ashes or tan, and well attended to till October, when they are housed in a cool house, carefully keeping them from frost till they are introduced into the forcing-house. For private establishments they are very useful, and when they get too large do well cut back occasionally after flowering, and put into a feck heat; when nicely broken, the shoots may be thinned to the requisite number, and treated as above. Market growers only use young plants. Old plants when too large for indoors do well treated like old Fuchsias—wintered where they can be protected from frost. They make very interesting objects for shrubbery and sub-tropical borders, and when not wanted may at a hazard be left in the borders. *E. W.*

Lilium Martagon dalmaticum.—Referring to Mr. Wilson's note at p. 116 of this Lily bearing with Mr. Ellacombe twenty-five blooms on a stem, I would remark that I have to-night counted forty-one on one of mine grown in the open ground. *Henry Buckley, 27, Whiteley's Road, Edgbaston, Aug. 2.*

Butcher's Broom (see pp. 82, 118), in combination with Horse Radish is boiled for a decoction, to be used in cases of dropsy. I am very often asked for it, and think that it must also be used for other purposes, but what I cannot say. *T. Smith.*

Orchids in July.—The following have been in flower during the last month, under the care of Mr. Beattie:—

Disa grandiflora	Odontoglossum cordatum
Herschellii	Roelzii
Anguloa uniflora grandiflora	Cryptochilus sanguineus (sold
Clowesii	first as Cologyne
Dendrochilum filiforme	species—then under
Cattleya Leopoldi	this name, same plants
marginata	and same importation)
intermedia	Sobralia macrantha
Forbesii	Laelia elegans lutea (one plant
Compertiana cocinea	among several im-
Aerides suavisimum	ported species of elegans,
roseum	bulb similar, but
japonicum	flowers a rich golden
virens Dayii	hue; labellum streaked
nobile	with red. Is it known
Colax jugosus	to any reader? Un-
" aurea (a bright lemon	fortunately the stem,
" colour, an accidental	which has four flowers,
" variety)	was broken off just as
Epidendrum macrochilum	they were opening)
vitellinum majus	" cinnabarina
Mesospidium vulcanicum	Ansellia Plantii
sanguineum	Lycaste aromatica
Acropora Loddigesii	" Deppiei
Dendrobium transparens	" Harrisoniana
" amatum	Saccobolium Blumei
" Parishii	" ampullaceum
" Pierardii	Angreum falcatum
" latifolium	Cypripedium Sedenii
" thyrsoiflorum	" nivium
" Farmeri	" longifolium
" marmoratum	" Roelzii
" sulcatum	" Lowii
" Philippianum	" barbatum nigrum
" calceolus	Miltonia spectabilis
Oncidium varbatum	" festiva
" Wentworthianum	" Clowesii
" Lanceanum	Peristeria elata
" triquetrum	Masdevallia Lindeni
" rostrans (insignificant	" Harryana
" and worthless)	" Veitchii
" articulatum	" peristeria
" flexuosum	" ignea
" papillo	Burlingtonia candida
" stelligerum	Stanhopea Wardii
" cucullatum	" Thunia alba
" tigratum (identical with	Phalenopsis cornu-cervi
" O. rostrans)	" roseum
" pulvinatum	" Luddeimannianum
Maxillaria venusta	" Brassia caudata
Odontoglossum Pescatorei	" Lawrenceana
" Alexandrae	" Gireoudiana
" Rossii	" Trichopilia fragrans
" rubescens	" Vanda tricolor
" Lindleyanum	" lamellata
" angustatum	" Zygopetalum maxillare

Edward W. Cox, Moat Mount.

Lilium Kramerii and its Varieties.—Among a large lot of Lilium Kramerii introduced from Japan last spring, and which are now flowering, I found several distinct varieties, some with shorter flowers, others with paler or darker tints, but among all one was most remarkable; it is a dark purple variety, of such a fine colour that it has been much admired by all who have seen it. I should be glad to know if this variety has been observed elsewhere. *J. H. Krelage, Haarlem.*

Trees Rooting from the Branches.—In addition to the species of Ficus named by Dr. Bennett in your issue of the 28th ult., which produce adventitious roots from their branches, there is Ficus retusa, Linn. This tree, in the wet season, produces vast numbers of these aerial roots, the greater number of the tips of which, however, perish when the dry season commences. Trees may be seen all along the streets in Hong Kong with hundreds of these aerial roots, several yards in length, hanging from their branches,

which, with a little protection from the accidents to which they are exposed, would soon reach the ground and take firm hold there. Roots from the branches of a tree growing on a dry and exposed situation, which I conducted through Bamboo tubes, grew about 10 feet, reaching the ground in one season. Ficus elastica may also be named as another species which produces aerial roots. *Charles Ford, Superintendent, Government Gardens of Hong Kong.*

The Cherry Currant.—We notice in the report of the examination of red Currants grown for trial at Chiswick, in your issue for August 4, that the Cherry Currant was considered the same as La Fertile. The Cherry Currant is with us slightly larger than La Fertile and a week or ten days earlier; it is an immensely strong, but rather awkward grower. La Fertile is almost as large as regards the fruit as the Cherry, it is a vigorous grower and makes an evenly balanced bush and is an immense cropper. We obtained it some years since from Mr. Rivers, the raiser, and there can be no doubt as to the correctness of our stock. *Ewing & Co., Norwich.*

Lilium Wittei.—In the report of the meeting of the Royal Horticultural Society of July 3 last (*Gardeners' Chronicle*, viii., p. 19), I see that H. J. Elwes, Esq., sent, among others, cut flowers of Lilium auratum var. Wittei, remarkable for its long, narrow, white petals, with a rich golden band. I should doubt if this Lily were the true Lilium Wittei, which till now I have not met in any other collection than my own. I suppose Mr. Elwes' Lily is Lilium auratum var. virginalis, which is quite different from Wittei. Mr. Elwes, in his monograph, thinks these two Lilies to be synonyms, or almost the same. As I have had both Lilies in flower at the same time I have been able to observe the decided difference between them. L. Wittei has not narrow, long petals, but rather broad and short ones; L. auratum virginalis is papillose on all the divisions of the perianth—the outer as well as the inner, and these papillae are very delicately tinged with light yellow. The divisions of the perianth of L. Wittei are totally glabrous. The last form I have never found among any lot of L. auratum. L. auratum virginalis I bought first in 1868 from Mr. William Bail; since that time I have found it sometimes among introduced lots of L. auratum, and at present several plants are in flower in my nursery which all have the papillose character on the perianth division, the petals being more or less narrow in the different plants. In consequence I think I am right in considering L. Wittei and L. auratum virginalis to be two different plants, leaving it to later examination to decide if L. Wittei must be considered as a separate species or merely as a variety of L. auratum. *J. H. Krelage, Haarlem.*

The Eagle's Claw Cactus.—In a late number of your paper (June 16, p. 749) a doubt is expressed whether the figure of the Eagle's Claw Cactus (the Mexicans call all these fish-hook Cacti, and the Indians actually make fish-hooks of those spines) truly represents E. Wislizeni, on account of the length and number of the spines. Botanists are only now learning, and amateurs will by-and-by also learn, that the length as well as the number of spines vary greatly in the same species of Cactus, and that age brings about great changes, not only in the shape of the plants and the number of their ribs, but particularly in the arrangement, number, and size of their spines. Young plants are more globose, with fewer ribs, smaller and fewer spines, in simpler order. In Echinocactus Wislizeni, of which I have seen a great many specimens of all sizes, this is most strikingly the case. As an instance I send you a bunch of spines just received from Arizona, taken from a large flowering plant, which exhibits a new variation of the same species—viz., with curved but never hooked spines. *G. Engelmann, St. Louis, Missouri.*

The Flow of the Sap.—I have no doubt instances in support of Mr. Murray's theory of the flow of sap could be indefinitely multiplied if people having the opportunity would only look about them. I send you with this some leaves from Acer Negundo, taken from near the top of stocks that had been budded, and where the buds had failed, or had become grown over and imbedded in the bark (rather a common occurrence with this tree) they were not worked again, and now, after two years have elapsed, this partial variegation shows itself. But a still stronger example is furnished in the case of a Horse Chestnut, in which was inserted a bud taken from the base of a partially variegated leaf that appeared upon an otherwise normal form. This bud did not take, and after two years have elapsed a part of the stock about 3 feet above the point of insertion becomes variegated, and some of it not merely in a partial manner, but thoroughly, as witness the leaf enclosed. And now comes the most curious part of the case. The stock just above the point where the bud was inserted forks

into two equal branches, one on the same side as the bud, and one on the other. The variegation has appeared upon the branch immediately over the bud, whereas the opposite shoot has not even a trace. I cannot say for certain that no variegation showed itself last year upon this tree, but if so it could only have been very slight, otherwise it could not have escaped my observation. *T. Smith, Newry.* [Our correspondent's specimens and statement are very interesting, but we do not see that they particularly favour Mr. Murray's views. Eds.]

Potato Seed not Growing.—In your Co. Kildare correspondent's true report of the Potato crop last week he asks could salt water have destroyed the germinating power of imported seed Potatoes, referring especially to one farmer's loss of 10 acres. That may be answered by others, but in the case mentioned the sufferer lays the blame on the Potatoes breaking in the sacks during transit and after. Imported seed was not the only kind that failed about here, so that I think we must look for some other cause, most probably to the fact of the "second growth" being very prevalent last year, which of course rendered the old tubers faulty for seed. *Hibernicus, Kilkenny, Aug. 7.*

Squirrels and Fruit.—It has been doubted by many that squirrels will attack fruit, but that they do so I have during the past week had ocular proof, for a nest of young ones having been reared in a Cedar of Lebanon close to the gardens they have commenced on some Warrington Gooseberries, and most assiduously did they work, carrying them away one at a time in their mouths. As I had already protected as many as we were likely to require, this I did not object to, and allowed them to divide the spoils with the blackbirds, but, like these bold depredators, they had no sooner assisted in clearing these bushes than they commenced operations on those that were netted, and soon cut their way through. I found, too, that they were stripping some Apple trees, but they did not appear to eat the fruit, for on watching them I found they nibbled them to pieces, apparently with the object of getting at the pips, as the ground was strewn with portions of Apples from which they had been removed. Reluctant as I am to destroy such interesting little creatures I was compelled to do so, and both old and young had to pay the penalty of their pilfering propensities. Two were caught in the net, and the others shot when running off with an Apple, which they usually took to the Cedars close by. *J. Sheppard.*

Lilium cordifolium.—I quite agree with Mr. Max Leichtlin, now that I have seen the flowers of my Lilium cordifolium, which were only in bud when I wrote my last communication. There is a great difference between those of the L. cordifolium, introduced twenty years ago, and my present plants, which I received from Mr. Leichtlin in the summer of 1875. The present plants are dwarfer in habit, and bear much smaller flowers. These are nearly pure white, with green inside, and the violet tinge of the petals which was found in the flowers of the former stock is at present nearly totally missed. The difference is so striking, and my present plants having all the same variation, one would think the present form to be a fixed variety of the major type, which has been figured and described, Steh. et Zucc., *Flora Japonica*, tab. 13 et 14, and *Flore des Serres*, tab. 216. Mr. Leichtlin perhaps will be able to inform us if this variation has been obtained accidentally in European cultivation, or if there are found different forms in Japan either wild or cultivated. As for the Lilium giganteum, I think I am right in what I said before: it was observed here that plants of the same stock flowered lower and earlier than usual. The Lily mentioned before was Hansoni not Stantonii. *J. H. Krelage, Haarlem.*

Hardiness of Eriostemon intermedium.—Another hardy shrub turns up in Eriostemon intermedium, this was planted on a south-west wall two years ago, and has remained quite uninjured. It flowered splendidly last spring, and is now growing most vigorously, has young shoots a foot long, and of the deepest green—more luxuriant, in fact, than we usually see the plant under careful indoor cultivation. *T. Smith, Newry.*

Potatoes.—I have just been having a look over some Potatoes in the neighbourhood of Reading, and have been much shocked to observe how destructive the Potato disease is already proving in that locality. In many instances the haulm is quite destroyed, and the roots have many badly affected tubers. Here in West Middlesex but little has been heard of yet, and little is to be seen, as generally the foliage is still green and vigorous; I was, therefore, quite unprepared for the evidences of the terrible fungus that I have since seen. With continued dry weather the crop may not be severely damaged, but with much rain the prospect will be gloomy. I was considerably

pleased to find that our excellent friend and Potato raiser, Mr. Robert Fenn, had but little to complain of yet, and that his several acres of fine new kinds were all looking in ruder health; the situation of his land is high, and the soil light and brashy. A small plot of the Lapstone showed the spot on the leaf most fully, and these, although Salus had been applied, were evidently fast going. Salus I found also had been largely used at Heckfield, but the results were the reverse of beneficial. I fear it will have to be acknowledged that this compound is useless as curative or preventative of the Potato disease. Mr. Fenn's new Anglo-American crosses are in this, the second year of growth, producing some splendid samples, and in variety, size, quality, and beauty would appear to be all that could be desired. The parents were the red American Late Rose and Willard, and the English red Bountiful, but nevertheless some of the progeny are singularly white both in flesh and in skin. *A. D., Bedford.*

The Layering of the Points of Vines.—The Lady Downe's house at Heckfield affords one of the best examples of the culture of that fine Grape to be found in the kingdom. The Vines are all planted on one side, and are carried up the roof and down the other side, making rods of nearly 30 feet in length, all carrying an even crop of bunches, of which there are about 550. The present year's shoots at the extremity of these Vines Mr. Wildsmith has layered in a prepared border, and all are rooted, the young growth still remaining. If next year these Vines are allowed to remain rooted at both ends, what may be expected to result? *D.* [That the Vines will do even better than before, may be the expected result of this experiment. See our last number for 1875, p. 810. There you will find the details of a somewhat similar experiment carried out by Mr. Rochford, of Page Green, Tottenham. Eds.]

Toxicophlæa spectabilis.—I send you a shoot of *Toxicophlæa spectabilis* taken from a plant kept during last winter in a cold house, and plunged out-of-doors in the full sun this season. The foliage, as you will observe, is quite unlike what we usually see on this plant grown in the stove—a deep coppery crimson colour. Even the young shoots that are being produced out-of-doors are also of the same colour; in this state a very distinct plant for many purposes. *T. Smith, Newry.*

Laxton's New Peas, Harbinger and Marvel.—At the last great trial of Peas at the Royal Horticultural Society's Gardens at Chiswick, Harbinger is said to have been three or four days earlier than any other in that great collection. I have grown it for some time, and can bear testimony to its hardiness. This season, sown on February 7, it is now (June 9) ready, while William I. and Little Gem are only just coming into bloom. The style of growth is rather straggling, about 2½ feet high, with from four to five pairs of pods on each stem, and averaging from four to five peas in each pod. As an early Pea it is a gain, though the produce is sparing; but gardeners should bear in mind that if Peas can be had that much earlier, it is certainly an acquisition. Marvel is also noted at the great Pea trial, and I believe received a First-class Certificate. It is, I fully believe, the most productive of any Pea of my acquaintance, growing from 3½ feet to 4 feet high, and the Peas hanging literally from top to bottom. It bears some resemblance to the variety called Dr. Maclean, but produces the pods in pairs instead of singly, as in Dr. Maclean, and has from eight to nine peas in each pod, green as a Leek, and of the very highest flavour; the seed is green and white, and wrinkled, but the plant is hardy. Sown here on December 12, it has battled bravely with this cold spring, and is now (June 9) in pod. These two new Peas are not yet let out to the public, but are in the hands of Messrs. James Veitch & Son, who will doubtless bring them out in due time. Touching the Peas raised by Mr. Laxton, I may mention that Standard is a superb variety, growing from 3 feet to 3½ feet high, averaging nine peas in each pod, and these so tightly packed when allowed to grow as to burst each other, but when gathered young they certainly are the right thing. If we take Harbinger as a first crop, Standard and Marvel as second, and that fine Pea, Omega, as the latest, no other four sorts could successfully compete against them. I must, perhaps, except Dagmar and the Baron, Peas of which more will be heard at some future day. *R. Gilbert, in "Florist and Pomologist."*

Orchid Sales.—I do not complain that imported Orchids are sold under false names—such as a worthless *Odontoglossum* for *O. spathaceum*, *O. Lindleyanum* for *Alexandria*; *Masdevallia* of some poor sort for *Lindeni*, or some wretched flower for *cirrhosum*; but when an established plant that has flourished is sold for *O. odoratum* and is only *Lindleyanum* I think it is too bad. In the first case the seller is often

as much a loser as the buyer. We often hear of new plants being bought for a trifle, both from the East as well as the West, and the difficulty would be met by the word "supposed" placed before the name or (?) after it. In the latter case it may be two years before the deceit is detected, and how can one appeal to Mr. Stevens under these circumstances, though I am resolved to do so if it occurs again. *An Old Orchid Grower.*

Tebbs' Universal Fumigator.—We have lately been using one of these fumigators, sent us for trial by Messrs. Flanagan & Son, 98, Cheapside, E.C., of the merits of which on the score of cheapness, construction, and performance of the work required of it, we can speak in very favourable terms. The tobacco-paper is placed in the fumigator on a perforated cone-shaped bottom, under which a few pieces of brown paper are placed, and then ignited, and, the feeding aperture being closed about half, it can be placed in a house, pit, or frame, with the certainty that it will not flame or go out until every bit has been burnt by slow combustion. It is cer-

FIG. 35.—TEBBS' UNIVERSAL FUMIGATOR.

tainly the cheapest fumigator that has come under our notice, and by far the best that we are acquainted with for amateurs and villa gardeners.

Reports of Societies.

Royal Horticultural: August 7.—W. B. Kellock, Esq., in the chair. The afternoon meeting was but thinly attended, as usual at this season, and Mr. Murray, after announcing the awards, made some remarks on the variations observed in the common red-spider.

FLORAL COMMITTEE.—W. B. Kellock, Esq., in the chair. No great variety of subjects came under the notice of the committee on this occasion. By far the most remarkable subjects exhibited were a couple of magnificent specimens of *Odontoglossum vexillarium* from the rich store of Sir Trevor Lawrence, Bart., M.P. On one of these—the ordinary pale variety—we counted eight spikes and seventy-four flowers; while on the other—a rich rosy coloured form—were seven spikes and fifty-three flowers, both plants being in the pink of perfection as to health and freshness, a point on which Sir Trevor has something to say in another column (see p. 173). A Cultural Commendation was awarded by the committee, who also recommended the rosy variety to the Council as a proper subject for the award of a medal. Sir Trevor Lawrence also gained a First-class Certificate for *Eulophia guineensis*, a new and striking plant, with a stiff erect spike of crimson and pink flowers. Messrs. Paul & Son, the Old Nurseries, Cheshunt, received a First-class Certificate for a fine new H.P. Rose named *Marquis of Salisbury*, a well-formed, full, globular-shaped flower in the style of *Alfred Colomb*, on which it may be considered an advance. Mr. B. S. Williams also received a similar award for *Dendrobium suavisimum*, the showy new species which resembles *D. chrysotoxum*, but, unlike that species, has a large rich maroon blotch in the centre; shown at Regent's Park this summer by Messrs. Low. Mr. Williams also sent several other new plants, including the bold, vigorous growing and handsome new *Croton Andreanus*; and the very distinct new seedling *Draena Bausei*, which gained a First-class Certificate. Mr. Parker, Tooting, received a vote of thanks for some cut flowers of the pretty *Asclepias tuberosa*. A fine group of admirably grown Balsams came from Mr. Puttick, of Acton; and Mr. Cannell, of Swanley,

sent some *Pentstemons* and *Antirrhinums*, and cut flowers of the very pretty *Cape Pelargonium echinatum*, white, with rich crimson spots; and a new variety of the same, named *Spotted Gem*, with bright rose petals, spotted with crimson and white centred—a very pretty thing for growing for cut flowers. A First-class Certificate was awarded. Several boxes of admirable cut blooms of *Roses* shown in quartettes instead of trios, as usual, a plan which shows up the individual characteristics of the different varieties with admirable clearness. Mr. R. Dean, Ealing, sent some cut blooms of several useful and showy border flowers, including some giant *African Marigolds* of great size. Messrs. Jackman & Son, Woking, showed *Biota orientalis densa glauca*, a seedling of compact habit—not quite distinct enough to be honoured with an award, but still a nice companion plant for the golden forms of the same species. Messrs. John Laing & Co., Stanstead, showed a fine group of the autumn-flowering *Phloxes*—wonderfully showy decorative subjects just now, but not half so much grown in pots as they deserve to be. From the Society's gardens at Chiswick came flowering examples of various double *Pelargoniums* and *Ten-week Stocks*, and specimens of Messrs. Vilmorin & Co.'s new *Celosia cristata variegata*—a good old plant utterly spoiled for decorative purposes. Messrs. James Carter & Co. sent a seedling *Gloxinia* named *Sybil Kenyon*, a variety with a hose-and-hose corolla, but with no other quality to recommend it. Messrs. Sander & Co., St. Albans, showed a good sample of their white *Candy-tuft Tom Thumb*; and Mr. J. Chambers, Westlake Nursery, Isleworth, had two hybrid *Begonias*, one of which, named *Defiance*—the result of a cross between *Weltoniensis* and a scarlet seedling—was remarkable for the richness of its scarlet colour.

FRUIT COMMITTEE.—The Rev. M. J. Berkeley in the chair. Messrs. T. Rivers & Sons, Sawbridgeworth, sent ripe specimens of *Hale's Early Peach*, a very early American variety, of medium size, good colour and excellent flavour, that has not been exhibited here before, though it has been known for some time. A First-class Certificate was awarded. The same firm also sent fruits of a new *Nectarine* named *Advance*, quite ripe, though gathered from a cold house. The samples were rather small, of a pale green, not particularly pleasing colour, but very good in flavour; and samples of the *Pine-apple Nectarine* that had been forced on, and were of splendid size and colour. Eight varieties of *Cherries* were also sent up from Sawbridgeworth, and as all were of excellent quality we give their names:—*Black Bigarreau*, and the late black variety, *Bigarreau Noir de Schmidt*, *Early Rivers*, and *Bedford Prolific*, all black varieties; and *Bigarreau Gros Cœur*, *Bigarreau Napoleon*, and *Monstreuse de Mezel*, whites. Mr. Barron brought up from Chiswick a bunch of the *White Romain Grape*, a white variety much resembling the *Royal Muscadine*, but much earlier, being ripe now, while the last-named is quite green. From Mr. Tillery, Welbeck, came some fine examples of *Grosse Mignonne Peaches*, and the highly-coloured *Welbeck Nectarine*. A very fine sample of the *Pitmaston Orange Nectarine* and excellent *Barrington Peaches* came from Mr. Pressley, gr. to G. Jennings, Esq., Farnale, Clapham; and Mr. James Douglas, gr. to F. Whitburn, Esq., Loxford Hall, contributed a dish of ripe *Kerry Pippin Apples*. A finely developed *Queen Pine* was shown by Mr. Ollerhead, gr. to Sir Henry Peck, M.P.; and from Mr. Miles, gr. to Lord Carrington, came a splendid dish of the handsome *Stamfordian Tomato*, which we hear is to be sent out by the Messrs. Dickson, of Chester. Mr. Hunter, gr. to the Earl of Durham, Lambton Castle, sent a fine dish of *Figs* under the name of *Lambton Castle Seedling*, which the committee could not distinguish from *Brunswick*. Mr. G. Cooling, nurseryman, Bath, sent samples of two new varieties of *Potatoes*, which were ordered to be grown at Chiswick for approval. H. M. Dunnett, Esq., sent a brace of a new white-spined, almost smooth *Cucumber*, said to be very prolific under frame culture.

Woodford Horticultural: July 18.—The summer exhibition of this thriving young society was held in the immediate vicinity of the beautiful gardens of E. N. Buxton, Esq., Knighton, Woodford. The larger number of the exhibits were effectively arranged in a splendid large tent, whilst a splendid lot of cut *Roses* staged by Messrs. William Paul & Son, Mr. Rumsey and others, were arranged in a separate tent. At this show H. F. Barclay, Esq. (Mr. Lovell, gr.), staged the best *Muscats* we have seen this season, though they were not fully ripe. The same exhibitor also staged some splendid *Nectarines*. Alderman Finnis, Wanstead (Mr. Simmons, gr.), staged many very meritorious subjects, consisting amongst others of *Fuchsias*, variegated *Pelargoniums* (very fine plants), *Gloxinias*, *Lycopodiums*, specimen *Ferns*, including the premier award for stove and greenhouse plants, &c. W. Mills, Esq. (Mr. Harrington, gr.), had many very neat and effective examples,

including *Maranta medio-picta*, *M. tubispatha*, *M. fasciata*, and, perhaps the most showy, *M. virginalis*; *Tillandsias*, *zonata* *viridis* and *fol. brunneis*; staging also some excellent Palms, viz., *Beaucarnea recurvata*, *Phoenix*, &c. *E. N. Buxton*, Esq. (Mr. A. Grove, gr.), staged some handsome Palms, comprising, amongst others, *Phoenix sylvestris*, a neat *Cocos Weddelliana*, *Areca lutescens*, *Latania borbonica*, *Areca sapida*, &c.; his miscellaneous collection comprised *Kentia* *Bemoreana*, a fine *Eucharis*, laden with bloom, &c. The Lord Mayor (Mr. Jones, gr.) received awards for stove and greenhouse plants and for Melons. *R. Lechford*, Esq. (Mr. Rumball, gr.), had the award for a basket filled with plants, *Coleus*, &c.; and *A. H. Berthoud*, Esq. (Mr. Kolstone, gr.), had the best Roses amongst gardeners. *Miss Barclay*, of Walthamstow (Mr. Pearce, gr.), staged many meritorious subjects in *Caladiums*, *Cucumbers*, &c., being well placed. Mr. Mead had some fine showy *Hydrangeas*. *J. Spicer*, Esq. (Mr. Darvill, gr.), received premier awards for black Grapes, splendid Peaches, Currants, &c.; *Petunias*, *Cockscombs*, and *Fuchsias*, by Rev. G. S. Fitzgerald (Mr. Fisher, gr.). *H. Fowler*, Esq. (Mr. Chambers, gr.), upheld well the *Picotee* and *Rose* interests, Messrs. Barnes, Peters, Thurgood, Riding, &c., aiding well in general subjects. The special prizes of Messrs. Daniels Brothers, Norwich, went to Messrs. Pearce, Grove, Bass, Ford, and others. The vegetable display, especially that connected with the cottage garden interests, were a great improvement upon past displays of the kind previously held this season in this county. Perhaps, however, as much of interest was centred in the ladies' classes set apart for table decorations; and this the more so because the prizes were well contested by the ladies of the neighbourhood—a fact which went far to make the show a display furthered and forwarded by all classes, and one which, whenever employed, will go farther, probably, to popularise these displays than perhaps any other. The displays were divided into two classes, one for a "single vase," intended, no doubt, for drawing-room decorations; and the other for a group of vases decorated with fruit, flowers, or leaves for a dinner-table; and three 1st prizes were awarded in connection with the latter class. They comprised an unique display by *Miss Gadsden* and, we believe, the *Misses E. N. Buxton*. Around an upright centre-piece were borderings of pink and white wild *Rose* blooms, encircled in turn in a kind of natural negligence by a wreath of *Bryony*, possessing its characteristic greenish flowers, berries, and lucid foliage. The centre stand, and four minor stands to match comprising the outer square, were elegantly wrought out of the large wild white *Ox-eye* *Daisies*, grasses, a *Poppy* head or two, and a spray or two of a small, single scarlet *Potentilla*. The effect was charming. *Miss White*, of the Mansion House, London, and *Miss Spicer*, Woodford, were the other winners. *Miss White's* design consisted of three splendid glass vases of elegant or chaste design, being very artistically arranged with garden flowers of quiet, subdued, yet most effective tints, being, in fact, a mastered effort at colour illustration. *Miss Spicer's* designs were far more simple and dwarf, yet possessing much elegance. Her arrangement consisted more in giving effect to neutral colours, *Orchid* blooms entering more fully into the composition.

We cannot say too much in praise of the wild-flower bouquets arranged by school children, for taken all in all, though exceeding probably fifty in number, there was not a bad bouquet amongst them. Some, indeed, were so lightly put together as to seem a *fac simile* of some of those dense floral wreaths which Nature attires herself with in field and hedgerow. These standing singly as regards the individual blooms were very distinct from the denser, more thickly packed ones. We believe the Honorary Secretary, Mr. Taylor, Woodford schools, is the moving spirit here. *W. E.*

Didsbury Floral and Horticultural: July 27 and 28.—Decidedly the best of the shows held since this flourishing Society set to work, and completely filling a great tent, described as the "largest in England." Of course in an exhibition of plants contributed almost exclusively from the conservatories of amateurs, *plus* cottage-garden flowers and vegetables, one does not look for anything particularly new and strange. The charm consists in the variety and the excellent condition of the specimens, and the abundant proof that the cultivation has been from first to last a labour of love. Regarded as an exhibition of the results of careful culture, and of a desire to bring every plant that is dealt with up to the very best condition it is capable of attaining, nothing could be more beautiful or satisfying. So long as gardeners set out with and keep faithful to this idea, the calling forth all the hidden secrets of loveliness there may be in a plant, purely in order to see what it will develop into, without thinking of prizes and rewards, floriculture is sure to prosper. At Didsbury there seems good guarantee for this, and the fact is

extremely gratifying to notice. Almost all the classes of plants now in bloom were shown in fair quantity, blending with abundance of extremely beautiful Palms, Ferns, and others of the kinds that remind us of what in regard to plants it is so important never to forget, namely, that contour is quite as large a factor of genuine beauty as colour. There were plenty, likewise, of gay-foliaged plants, *Crotons*, *Caladiums*, *Colenuses*, and others that illustrate how wonderfully Nature, when she takes a fancy so to do, can diversify any single idea. It is well that these charming modifications of simple and original types should be thus set out for people's consideration, placed side by side, so that the eye can take in all at once, since the great, and essential, and permanent value to us of the varieties or sports in which Nature indulges consists in the lesson they supply as to the still more wonderful fact of its unity. Very pleasant was it at Didsbury to see so many sorts in juxtaposition—the same tune sung, as it were, in a score of different keys and variations. Another good feature of this excellent show consisted in the overwhelming preponderance of natural plants, by which expression we mean plants allowed to retain within proper limits the forms which Nature prescribed to them in the beginning, as opposed to the unduly tied-in and constrained, often so painful to observe, and pertinacity in which is always a sign to us, not only of indifferent taste, but of a deficiency of good sense, for good taste means that which is in closest accord with reason and symmetry. Nothing is more charming in a cultivated plant than an air of perfect spontaneity. A plant that gives one the impression of great labour having been bestowed upon it in order to make it what it is can never be accounted properly beautiful. Very charming as illustrations of how a plant may be at once natural, and at the same time trim and graceful, were the lovely *Fuchsias* exhibited by *Miss Ashton*, Mr. Adamson, Mr. Silkenstadt, and Mr. Bolland.

Orchids at the present season one does not look for, either in abundance or perfection. Very nice examples of this delightful order of plants were shown, nevertheless, by Mr. James Fildes and Mr. Joseph Broome. Mr. Fildes' principal plants were *Aerides quinquevalnerum*, *Occhidium Lanceanum*, and *Cypripedium niveum*. Mr. Broome showed *Cypripedium Veitchii*, *Epidendrum vitellinum*, *Phalaenopsis grandiflora*, and several others. The massive and imposing feature of the show consisted, of course, of the mixed collections of stove and greenhouse plants. In these the chief honours fell to Mr. W. S. Schloss, Mr. H. Samson, and Mr. Broome. The next most attractive were, perhaps, the groups "arranged for effect"—a class we are always glad to see in a schedule, for although it often implies very ordinary materials, the combination of forms and hues in a tastefully pictorial manner is so very elegant and useful an art that one is content to overlook the individuals and contemplate the total, which indeed is all we are asked to do, and beyond which it is scarcely fair to go. At Didsbury they seem to have people who understand this engaging art. Nothing could be more beautiful in its way than the grand group which confronted the visitor immediately upon entering—a contribution from Messrs. E. Cole & Sons; or than the groups in other parts of the tent, which came from *Miss Ashton*, Mr. Adamson, Mr. Gammon, and Dr. Reed. The loveliest sets of any one particular kind of flowering plant consisted unquestionably of the *Gloxinias*, the 1st prize for which went to Mr. Thomas Ashton. Among them was a wonderfully well-flowered specimen of *Boule de Neige*, cream-white, and of the utmost purity, with alongside an equally beautiful *Madame Tibaut*, the margin ornamented with copious lilac specks. *Cut Roses* came in good quantity from Mr. Henderson, Mr. Silkenstadt, Mr. Adamson, Mr. James Brown, and Messrs. Robson & Bush; *Pelargoniums*, in profusion, from Mr. and *Miss Ashton* and Mr. Silkenstadt; *Phloxes*, very charming, from Messrs. Cole & Sons; and *Cockscombs*, a grand lot, from Mr. Henderson. *Selaginellas*, *Petunias*, *Acimenes*, and bouquets were also supplied freely. In reference to the bouquets, which were mostly very creditable to the makers, we must once again remark however, on the undesirableness of using a superabundance of flowers, and point out also that much harm is done by introducing a great blossom like that of a recurring petalled *Lily*, which simply conceals the prettier things close by, without adding at all to the intrinsic merit. To introduce these big *Lily* flowers is objectionable upon another ground. The long stamens inevitably lose their anthers, so beautiful when balanced in their places, and the spectacle of the filaments, decapitated, so to speak, is then only a few removes from the disagreeable. We say this in kindness, not intending anything in disparagement of work very neatly done, but simply to give a hint how still better it may be done in future. Excellent fruit was shown, of the accustomed kinds, but not in any large quantity.

The cottagers' classes, as heretofore, were all very well sustained. It is always very pleasing to see the old-fashioned annuals and perennials coming nicely to the front, *Sweet Williams* and *Antirrhinums*, *Pinks*,

and scarlet *Lychnis*, especially when accompanied by plenty of good vegetables. Nothing could be more creditable to the cultivators than the *Peas*. Models of gardens were also shown, one or two very nice indeed, being laid out in part as shrubberies. This kind of rudimentary study of the capital employment called landscape gardening is one that might be very usefully pursued. We have never seen better efforts than those at Didsbury, and congratulate all concerned in the welfare of the Society that at every point there is indication of progress so good, with promise so encouraging as to the future. *G.*

National Carnation and Picotee Society: Aug. 4 and 6.—The season has not proved auspicious in the matter of Carnations and Picotees, as far as the North of England is concerned. The weather has been generally cold, cheerless, and sunless, and the result is the Carnations and Picotees are not yet in bloom. There was consequently a great falling off of flowers at the Botanical Gardens, Old Trafford, on the above dates. There was a show certainly, but it was so shorn of its usual proportions, owing to so many flowers not being in bloom, that it is under consideration whether it will not be advisable to hold a supplementary show a week or ten days hence. Many of the growers, too late to exhibit on the 4th, would be able to make a fine display on, if this suggested show takes place.

The Carnation and Picotee blooms were arranged in the large conservatory of the Botanical Gardens, and with the cottagers' produce filled three long tables. A half-length of table sufficed for the representatives of the *Dianthus* family. Some remarkably good flowers were staged, but the main body showed signs of immaturity. The lack of bleaching which gives so much inferiority to the ground of the flowers, evidenced the absence of sunshine, and indeed some of the growers were of opinion that the glorious luminary had parted company with the county of Lancashire for a time.

But three stands of flowers competed in the leading class for twelve dissimilar CARNATIONS, though five prizes were offered. The best stand came from Mr. B. Simonite, Rough Bank, Sheffield, who had P.F. James Douglas, very fine; S.B. Lord Napier, P.F. Dr. Foster, very fine; C.B. J. D. Hextall, a grand flower, raised by the exhibitor; R.F. John Keet, fine; S.F. Sportsman, R.F. James Merryweather, S.B. Admiral Curzon, P.F. Squire Meyaell, S.B. Mars, seedling S.F. and seedling R.F. 2d, Mr. Jonathan Booth, florist, Failsforth, with S.B. Admiral Curzon, Seedling S.F., R.F. Uncle Tom, S.B. Garibaldi, R.F. James Merryweather, P.P.B. James Taylor, S.F. Annihilator, P.F. James Douglas, S.F. Sportsman, R.F. Sybil, C.B. Lord Milton, and R.F. John Keet. 3d, Mr. Samuel Brown, Nottingham, the best flowers in this stand being Sybil, James Merryweather, P.F. Ajax, Annihilator (very good), C.B. Gem, Admiral Curzon, and R.F. Flora's Garland. Mr. B. Simonite was also 1st with twelve dissimilar Picotees, having L. Rose Miss Sewell, H.P. Mrs. Niven, L. Rose Miss Wood, L. Rose Mrs. Alcroft (extra fine), L. Rose Fairy Queen, H. Red Leonora, H. Rose Juliana, L. Rose Teresa (a beautiful seedling of the exhibitor's raising, of first-class quality), and the remainder promising seedlings. 2d, Mr. S. Brown, with L. Red Lucy, L. Red Arbitrator, H. Rose Mrs. Davis, L.P. Amy Robsart, H. Red Miss Small, L. Rose Countess of Kent, H. Purple Purple Perfection, Med. Red Emily, L. Red Miss Ward, H. Rose Kitty, H. Purple Mrs. Niven, and seedlings.

The next class was for twelve Carnations, nine at least dissimilar, open to growers of 400 pairs or less. The best stand came from Mr. George Rudd, Undercliffe, Bradford, who had S.B. Sir J. Paxton, very fine; P.P.B. James Taylor, R.F. James Carter, P.P.B. Eccentric Jack, S.F. Clipper, R.F. John Keet, S.B. Admiral Curzon, C.B. Maréchal Ney, S.B. Mars, and seedlings. 2d, Mr. Richard Gordon, Eccles, Manchester, with P.P.B. Eccentric Jack, R.F. Sybil, P.F. Squire Trow, R.F. Cristagali (Whittaker), very fine; P.F. John Keet, P.F. Earl of Stamford, C.B. J. D. Hextall, P.F. Dr. Foster, P.F. Mayor of Nottingham, and S.F. Clipper; 3d, Mr. S. Brown; 4th, Mr. P. Mellor, Ashton-under-Lyne. In the class for twelve PICOTEES shown under the same conditions, Mr. G. Rudd was 1st with M. Red William Summers, M. Purple Zerlina, H. Red J. R. Bryant, H. Purple Alliance, Rev. F. D. Horner, L. Rose Mrs. Fordham, L. Rose Fairy Queen, L. Purple Mary, H. Rose Mrs. Lord. 2d, Mr. S. Brown, with Lucy, Arbitrator, Emily, Kitty, Purple Perfection, Miss Wood, Mrs. Davis, Catherine and Mrs. Johnson. 3d, Mr. T. Mellor, whose best flowers were Mrs. May, Lady Elcho, Prima Donna, Mary, and Mrs. Lord.

In the class for six Carnations, dissimilar, open to growers of 150 pairs or less, Mr. Stark, Chesterfield, was 1st, with R.F. Sir F. Barnaby, P.F. Dr. Tooter, P.F. Mayor of Nottingham, P.P.B. James Taylor, R.F. Mrs. Holland, and R.F. Merrimac. 2d, Mr.

W. Taylor, Middleton, with S.F. Sportsman, S.B. Mars, R.F. Lovely Ann, S.F. Mr. Battersby, S.F. Clipper, and P.F. Esther. There were but two exhibitors in this class. S. Cooper, Esq., Timperley, Cheshire, was 1st with six *Picotées* grown under the same conditions, having H. Red Miss Small, Light Red Mrs. Bower, L. Purple Ann Lord, L. Purple Mary, H. Red Mrs. Fuller, and M. Red Ensign. 3d, Mr. Stark, with Margaret, Mrs. Allcroft, Ethel, Mrs. Fordham, Admission, and Mrs. Norman.

In the classes for single blooms a large number were shown, as usual. The best scarlet bizarre was Dreadnought, from Mr. B. Simonite, and he was 2d also with a seedling. Then followed in the order of merit Admiral Curzon, Mars, and Sensation. In the class for crimson bizarres Mr. B. Simonite was awarded the five 1st prizes with J. D. Hextall, without doubt the very best flower of its class; Mr. J. Booth coming 6th with Lord Milton. The best scarlet flake was Sportsman, from Mr. G. Rudd, who was also 2d with Clipper. Then followed a seedling of Mr. B. Simonite's, bright in colour, Sportsman and Clipper. The best rose flake was Sybil, shown in excellent condition by Mr. J. Booth—Mr. T. Mellor being 2d, with James Merryweather; then followed, in order of merit, Admiral Curzon, John Keet, and Merrimac. The best purple flake was Dr. Foster, from Mr. B. Simonite, very fine, and the same exhibitor followed with James Douglas, Mayor of Nottingham, and Squire Mayoell, securing all the prizes in this class. The best heavy red *Picotée* was J. B. Bryant, from Mr. B. Simonite; and he was 2d also with Miss Small—Ensign and Lord Valentine followed next in order. The best and 2d best light red were seedlings from Mr. B. Simonite; Mrs. Bower was also well shown. The best heavy purple was a fine seedling named Miss Chadwick, which was awarded a First-class Certificate. It was raised and shown by Mr. Joseph Chadwick. It has a pure ground and fine petal, and will be a thoroughly good flower. This variety also took the 2d and 3d prizes. Picco took the remaining three prizes. The best light purple was a seedling from Mr. P. Mellor, a small but very charming flower, with a finely formed edge, and very pure in colour. 2d, Mr. S. Cooper, with Ann Lord, which variety also took the remaining prizes for the same exhibitor. The best light rose was Teresa, finely shown by Mr. B. Simonite; next came Mrs. Allcroft, Miss Sewell, and Miss Wood. The best heavy Rose was Mrs. Lord, from Mr. J. Chadwick; and Mr. Booth was 2d, with the same variety. Juliana came next, and the remaining prizes went also to Mrs. Lord. The premier Carnation was Simonite's J. D. Hextall; the premier *Picotée* Chadwick's Miss Chadwick.

It is worthy of record that the *Picotées*, which are usually eight or nine days later than the Carnations in blooming, have this season preceded them by several days.

Manchester Botanical and Horticultural: August 4 and 6.—By way of giving a character of comprehensiveness to the excellent work being performed by the Manchester Society, an exhibition of cottagers' produce was arranged for and held in the Botanical Gardens, Stretford, on the above dates. The competition was not confined merely to cottagers resident in the Manchester district, but open to any residing in the United Kingdom. The first two classes (for plants) were restricted for cottagers having no garden, but only a window in which to grow plants, and it was cheering to notice that by far the greater majority of the plants staged in these classes showed unmistakable signs of window culture. The other classes were open to cottagers having a garden, with the proviso that it might include frames and a small greenhouse. As a matter of course the designation "cottager" had to embrace many of a different character to that understood in a country district, and operatives, artisans, &c., were found competing. As far as it could be brought about, only those qualified to exhibit were permitted to compete.

As a first experiment the show must be pronounced a decided success. The promoters could have wished to have seen more exhibits, fairly numerous as they were, but time is required to give publicity to such a project, and there is already reason to believe the number of exhibitors will be considerably increased next year. The prizes are good, their value is beyond what is usually given at cottagers' shows.

The best window-grown *Pelargonium* came from George Whitfield, Stretford; the best *Fuchsia* from Lamb, Didsbury. They were both capital specimens, and must have been carefully tended to have had them in such good condition. The three Ferns staged by R. Tyldisley, Worsley, were remarkably good, large, clean examples of *Adiantum cuneatum*, a handsome crested *Lastrea*, and *Osmunda regalis cristata*. J. Sidebottom, Manchester, came next with *Davallia pyxidata*, *Trichomanes radicans*, and *Ilymenophyllum demissum*. In the class for three plants, distinct, Abel Cartwright, Stalybridge, had good examples of *Fuchsia*, a tuberous-rooted *Begonia*, and a *Coleus*. W. Higginbotham, Swinton, was 2d

with a *Fuchsia*, 2nd *Pelargonium*, and a capital double *Petunia*. So good was the competition in this class that equal 3d prizes were awarded.

Fuchsias in threes, as well as in twos, were very good, and so were the *Pelargoniums*. The best pair of the latter included gold and silver-edged *Tricolors* very well-grown. There was a class for a collection of British plants, and two collections were staged, but one had to be disqualified, owing to containing some Japanese and other plants of foreign introduction. There were groups of succulents and other things of an interesting character.

In the way of cut flowers there were miscellaneous collections which were capitally shown—hardy herbaceous flowers, Phloxes, Roses, Carnations, Sweet Williams, Pansies, &c. Bouquets of wild flowers were remarkably well done.

Vegetables were somewhat sparingly represented, but there were good Potatoes, both round and kidney; Lettuce, Beans, Peas, Turnips, &c.

Fruit was confined to Gooseberries and Currants. There were four classes of the former, viz., yellow, red, white, and green. The prizes in these classes were given by Mr. Samuel Barlow, and a very spirited competition ensued. The best red varieties were Sir Colin Campbell, Linden, Companion, Beauty, Dan's Mistake, Speedwell, and Crown Boh; the best yellows were Leveller and Ringer; the best white Hero of the Vale, Countess, and Antagonist; the best greens were Green Surprise, Stockwell, and Plunder.

The show was greatly helped by valuable collections of plants from J. Rylands, Esq., J. Broome, Esq., and Mr. B. S. Williams; cut Roses from Messrs. Paul & Son, Cheshunt, F. & A. Dickson & Sons, and J. Dickson & Son, Chester; very fine cut Sweet Williams, from Mr. S. Barlow; skeleton leaves and flowers from Mr. Cussons; and various other exhibits of an interesting character.

Weston-super-Mare and East Somerset Horticultural: August 1.—The Weston-super-Mare Society's show has now for some years been one of the best summer displays, and on the present occasion fully maintained its character. Neither is this to be wondered at: the thorough excellence of the arrangements carried out by the committee for all concerned, and the handsome prizes they offer, induce those who have large and valuable plants to incur the serious expense and immense amount of labour involved in carrying such over long distances. In the open class for twelve plants in or out of flower, Messrs. Lacombe, Pince & Co., Exeter, took the 1st prize of £20 and the Royal Horticultural Society's Silver Medal for a collection in every way equal to anything we have ever seen at this time of the year. It consisted of *Ixora Williamsii*, bearing some seventy fine heads of bloom (one of the best of the numerous hybrids that now exist, but all of which lack the fine shade of colour and long-enduring character in the flowers of the species, *I. coccinea*); *Allamanda Hendersonii*, profusely bloomed; *A. grandiflora*, *Dipladenia amabilis*, *Clerodendron Balfourianum*, very large, finely-flowered, and as fresh as it is usually seen in May; a splendid *Erica Fairrieana*, *E. Irbyana*, and *Eucharis amazonica* with about twenty-eight large umbels of its snowy flowers; these were backed by a huge *Latania borbonica*, equally fine samples of *Pritchardia pacifica*, and *Steveasonia grandiflora*, and an immense, well-coloured *Croton variegatus*. E. Pilgrim, Esq., Cheltenham, was awarded the 2d prize and Bronze Medal of the Royal Horticultural Society for a very fine group, in which was *Erica Thompsonii*, 4½ feet through, splendidly flowered; *E. Parmentieri* *Dracophyllum gracile*, nicely bloomed and quite fresh; *Azalea Brilliant*, a large well flowered specimen, also as fresh and in as good condition as *Azaleas* are usually seen in May; *Croton longifolius*, variegatus, and *Encephalartos villosus*. Messrs. Parker & Bush, Bristol, 3d, showing smaller, but very good plants, amongst which we noticed *Ixora Prince of Orange*, and *Franciscea calycina*, well flowered. 4th, Messrs. Bryant & Hoskins, Bristol.

Six stove and greenhouse plants in flower.—1st, Messrs. Lacombe Pince & Co. with medium-sized, finely flowered examples, including the seldom seen *Ixora salicifolia*, covered with beautiful heads of handsome blooms, and *I. amboinensis*, also profusely flowered; Mr. Pilgrim 2d.

Six fine-foliage plants.—1st, Messrs. Lacombe, Pince & Co., who staged a fine group, in which *Cycas circinalis* and *Croton undulatus* were conspicuous. Messrs. Parker & Bush were a good 2d: in their half-dozen was the best plant of *Anthurium crystallinum* we have seen.

Eight Ferns.—For these Messrs. Lacombe Pince & Co. were also 1st, having among others the ever-to-be-met-with, but rarely surpassable *Davallia Moorei*, large and in fine condition; a beautiful example of *Asplenium Nidus*, and *Pteris scaberula*, unsurpassed for the elegance of its finely divided fronds. This plant was remarkably fresh and green, a condition it is not always seen in, often on

account of its being affected with thrips, to which it is very subject if grown in too much heat. 2d, Messrs. Parker & Bush.

Eight *Adiantums*.—Here Messrs Parker & Bush took the lead with large plants in good fresh condition; 2d, Messrs. Bryant & Hoskins.

Six *Orchids*.—1st, Mr. J. W. Mills. In his exhibit were nice plants of *Pilumna fragrans*, *Epidendrum vitellium majus*, and *E. prismatocarpum*.

In the classes for six *Fuchsias*, six *Liliums*, six *Petunias*, six *Clematis*, six *Begonias*, six *Gloxinias*, and eight hardy Ferns, Mr. S. Brown, Weston-super-Mare, was 1st.

New or rare plants.—Messrs. Lacombe Pince & Co. 1st; Messrs. Bryant & Hoskins 2d—both showing good plants of *Croton Disraeli*.

In the classes for amateurs for six flowering plants Mr. Pilgrim was 1st, his best examples being *Anthurium Scherzerianum* and *Erica tricolor coronata*. This collection likewise received the Royal Horticultural Society's Silver Medal. 2d, Mr. J. W. Miles. In this group was a splendidly flowered *Lapageria rosea*. Six fine-foliage plants.—Mr. Pilgrim 1st, having, amongst others, beautiful examples of *Cocos Weddelliana* and *Phormium tenax variegatum*; 2d, Mr. J. Lawless. For a single stove or greenhouse plant Mr. J. W. Miles took 1st, with an exceedingly fine specimen of *Odontoglossum hastilabium*; Mr. Pilgrim 2d, with a finely grown and equally well flowered plant of the comparatively new *Boronia elatior*, the elegant drooping branches of which were clothed with its deep rosy-pink flowers. For either exhibition or home decoration this is a first-class plant.

Cut flowers.—There was a considerable display of Roses for so late in the season. In the open class of twenty-four varieties, three blooms of each, there were six competitors. With most of the exhibitors the flowers were in extremely varied condition, the greater number good, and some very bad, no doubt owing to the extreme heat of the previous day. Mr. W. Corp, Oxford, was a long way 1st, staging a really fine lot of flowers for the time of the year, the best being Marie Rady, La France, Alfred Colomb, Devienne Lamy, and Sénateur Vaisse; 2d, the Rev. J. B. M. Camm; Messrs. Curtis & Sandford, Torquay, 3d.

Twenty-four Dahlias.—1st, Mr. J. Nation, Taunton. Twenty-four *Gladioli*.—1st, Mr. S. Brown.

Twenty-four bunches of miscellaneous cut flowers.—1st, Mr. J. W. Miles, with a really grand lot; 2d, Mr. S. Brown.

Twelve herbaceous Phloxes.—1st, Messrs. Lacombe Pince & Co.; 2d, Messrs. Bryant & Hoskins. Hand bouquet.—1st, Mr. W. Pethick; 2d, Messrs. Lacombe & Pince.

Amateurs' cut flowers: twelve Roses.—1st, the Rev. J. B. M. Camm; 2d, Mr. T. Hobbs, Bristol. Twelve Dahlias.—1st, Mr. J. Nation.

Group of flowers for drawing-room table.—1st, Mr. T. Meakins.

Group of flowers and fruit combined.—1st, Mr. H. Norton.

Fruit.—The show of fruit was not equal to what we have seen here before, no doubt in some measure consequent upon the earlier date of the exhibition. Eight varieties.—1st, Sir A. H. Elton. In this collection were some very good Black Hamburgh Grapes and Royal George Peaches. 2d, Earl Fortescue, who showed amongst others an excellent Smooth Cayenne Pine and Crawford's Early Peaches. One Pine.—1st, Earl Fortescue; 2d, Sir A. H. Elton. Three bunches white Grapes.—1st, the Rev. J. Heyworth; 2d, Mr. T. Hallett. Three bunches black Grapes.—1st, Mr. J. F. Norris, with medium-sized Black Hamburghs, well finished; 2d, Messrs. Lacombe Pince & Co., with large fine bunches of Mrs. Pince's Muscat. Six Peaches.—1st, Sir A. H. Elton; 2d, Earl Fortescue. Six Nectarines.—1st, Earl Fortescue; 2d, Mr. J. B. Lowe. (From a Correspondent.)

Notices of Books.

A New London Flora; or, Handbook to the Botanical Localities of the Metropolitan Districts, compiled from the latest authorities and from personal observation. By Eyre Ch. de Crespiigny, M.D., M.R.C.S., late of H.M.'s Medical Service in India, &c. London: Hardwicke & Bogue, 1877.

Dr. de Crespiigny starts with the assertion that "a new London Flora is much required;" and we are inclined to agree with him. In these days of bank holidays, Saturday half-holidays, cheap trains, and frequent excursions, there are many to whom a compendious work indicating the localities where they might find some of our more interesting plants would be a useful companion in their country rambles. But for such a purpose it would have to be limited to recently observed plants, and should be brought up to the latest date; historical records of species, however interesting, are quite out of place in a work of

such scope. Dr. de Crespigny's book would have been smaller, but infinitely more useful, had this principle—which, curiously enough, he himself lays down very definitely—been adhered to: and the value of his compilation is materially lessened by its non-observance. To take an instance from his first page: *Adonis autumnalis* is localised at (among other places) Acton and Reigate; but the authority for its occurrence at Acton is no more recent than Blackstone (1746), while at Reigate only solitary specimens, probably escapes, have been met with (see *Fl. Surrey*, p. 2). On the same page we find, among the localities for *Aceras anthropophora*, "chalk pits on the Hog's Back, and old chalk pits near Harefield (?)." But these localities, in spite of the conjunctive "and," are in no way connected, the Hog's Back being in Surrey, and Harefield in Middlesex. Moreover, *Aceras* is not given, even doubtfully, in the *Flora of Middlesex* as a plant of that county, and the (?) seems to imply a doubt of any more recent record should such exist. Among the localities for *Actinocarpus Damasonium* we find "Felbridge pools, perhaps." Does this merely mean that the locality is a likely one, although the plant has never been found there?

Leaving the first page, and glancing through the volume at random, the first thing that strikes us is the heterogeneous manner in which the localities are mixed up, no attempt being made to keep those of each county together; and as the county is hardly ever mentioned, and when mentioned is frequently wrong—e.g., Bisham is in Berks, not Herts (p. 22), and so is Newbury, though Dr. de Crespigny places it in Beds (p. 28)—the effect is, to say the least of it, somewhat confusing. Some of the entries, again, are puzzling. What information is conveyed by the following:—"Cuscuta epilinum, on Flax, rare, S, *Cybele Brit. ii., iii.*," or by "*Carduus Forsteri* (hybrid) Surrey (? olim, an obscurity, *Cybele Brit.*)"? *Cerastium pubinlum* [?], which has not been found in Surrey since the time of Dickson, its original discoverer, should be omitted altogether, or, if inserted, requires an "*olim*"; Dr. de Crespigny only adds to its locality "subject of controversy," which might be stated with at least equal truth of many other plants.

Of course this kind of criticism might be continued indefinitely—almost every separate entry suggests it. Dr. de Crespigny is scarcely more happy in his generalisations. He says of the genus *Chenopodium*, "Species difficult to determine, any number may be made; vide Moquin, in vol. iii. [xiii.] of De Candolle's *Prodromus*." But no British botanist need confuse our *Chenopodia* if he will take ordinary pains about them; while Moquin certainly has not described so many forms as to call for such a criticism. Still worse is the announcement (p. 95) that "the vast and formidable array of anomalous vegetable growths known as blights, mildews, mould, oak-spangles [!] &c., have no claim to be classed as fungals, whatever may be said for *Clavaria*, *Sphaeria*, *Peziza*, and other amorphous vegetations of a membranous, horny, fleshy, and even gelatinous structure." After this we are prepared for anything; so that the appearance of "*Plantago lacustris*" at p. 51, followed by "*Plantago coronopus*, see *P. lacustris*," does not startle us as it might do under other circumstances.

One or two curious omissions are scarcely less puzzling. The paucity of Buckinghamshire localities may be accounted for by the small amount of printed matter relating to the plants of that county; but the principle of selection from published works is very difficult to ascertain. For instance, *Agrostis spica venti*, though not a common grass, is so abundant in some parts of Middlesex as to be a troublesome weed, and is duly recorded as such in the *Flora* of that county; but not a single Middlesex locality is given for it in the *New London Flora*. As critical forms are by no means excluded, some mention should have been made of *Aira flexuosa*; *Lepidium Draba*, again, has only two localities—by the Thames between Hammer-smith and Kew, and at Barking. In the former place Dr. de Crespigny notes "(?) from seed washed up from Thanet;" but if "washed up" from anywhere it is much more likely to have come from the well known and not far distant station near the Wandsworth distillery, where it was plentifully established for many years, and in all probability still holds its ground. Yet this locality is not even mentioned; neither is that near the Edgware Road station of the North London Railway (see *Flora of Middlesex*), where it still abounds, and has been established for at least a dozen years. *Sonchus palustris* is certainly not extinct in its Thames localities.

We observe that the *New London Flora* is dedicated to Mr. H. C. Watson, and that it is interspersed with quotations from his works, which, severed from their context, do not always fairly represent their author, who will, we fancy, be inclined to exclaim "save me from my friends." Many other points suggest criticism, such as the general plan of the book, the list of authorities quoted, and the detailed list of localities at the end of the book; but *le jeu ne vaut pas la chandelle*. It is fair, however, to add that the short descriptions of the localities which precede the special lists are very well done, and convey in few words an accurate idea of the places they describe.

Hops; their Cultivation, Commerce, and Uses in Various Countries. By P. L. Simmonds. (Spon.)

This little book is a useful compilation, embracing statistical and other details relating to the culture and properties of the Hop. We must not look for entire accuracy in such a work—indeed, the author modestly hints at his inability to give "much practical or novel information to the experienced Hop-grower." On the other hand botanical accuracy must not be looked for, else we might point to the botanical details of the Hop, and of the mildew which affects it, as points requiring more perfect treatment. The most valuable part of the present work consists in the statistical details scattered through various publications, but here condensed in small compass for ready reference.

Coffee Planting in Southern India and Ceylon.

By E. C. P. Hull. London: E. & F. N. Spon.

This book appears at an opportune time, when so much attention has been drawn to the diminished supply of Coffee from Ceylon, in consequence of the ravages of the *Hemileia*. At the present time there are frequent inquiries among planters and intending planters in different colonies for handbooks on the cultivation and preparation of useful plants, and principally, perhaps, those treating on the two chief beverages, tea and coffee. On the former product, however, comparatively little has been produced in book form, while several good treatises on Coffee culture have of late issued from the press. This latest contribution is a well-got-up book of handy size. The book commences with a very brief popular description of the plant of *Coffea arabica*, with a notice of its native country, introduction into Europe, general history, properties, and uses.

That the author has made himself acquainted with his subject is evident from the outset, for he refers to the prospect of the larger cultivation of the Liberian kind in Ceylon, its more robust habit, productiveness, &c. The climate best suited for Coffee cultivation is duly considered, together with elevation, temperature, &c. On this point the author says:—"At an elevation of between 4000 and 5000 feet above sea-level in Ceylon one sees, supposing the situation to be not unduly exposed to wind, fields of dark evergreen, luxuriant Coffee trees, so well clothed with foliage that not a square yard of bare ground is visible for acres. Such situations have what may fairly be called an exceedingly humid climate; probably hardly a week passes without rainfall, while at certain seasons this occurs without intermission for weeks together; even after a fair bright noon-day a dense white mist will frequently settle down towards evening, wrapping all in obscurity, and saturating vegetation with moisture. The temperature here will probably seldom rise above 70° in the shade, at other times falling as low as 50°. The general result is that although the trees have a gloriously healthy appearance, they bear hardly any crop."

The opposite extreme is a climate where there is great heat and scarcely any rainfall during a great part of the year, a few showers occur during the spring months, and a perfect deluge may be looked for while the monsoon lasts, from June to August. For four or even five months of the year droughts often prevail, the sun being so hot that the ground opens in fissures, the jungles are parched and vegetation actually burnt off. "The effect of this ordeal upon the Coffee is at once apparent, the plant, although not by nature deciduous, beginning first to droop, and finally losing nearly all or much of its foliage year after year, until eventually it falls a prey to the effects of exhaustion in one form or other." Neither of these conditions then is suitable to the proper cultivation of Coffee, what is required being a medium climate where a healthy growth of

the plant may be promoted, together with productiveness and longevity. It is shown that Coffee is capable of bearing a considerable degree of heat provided there is a proportionate humidity, but this humidity is often the cause of agues and other afflictions to the health of the planters. Into all these considerations the author enters as well as into the subjects of contracts, labour, food supply; a good deal of space is given to actual cultivation, such as planting, the best tools for use, the care of the plants in their young state, and the preservation of the trees in maturity, also on the gathering of the berries, pulping, washing, and drying; and finally we have estimates and statistics of the cost of Coffee culture both in Ceylon and Southern India, and an appendix is added giving instructions "for the medical treatment of coolies and others on Coffee estates until professional assistance can be obtained." Altogether the book is one that will commend itself to all those interested in the culture and uses of Coffee.

The Emigrant and Sportsman in Canada, &c.
By John J. Rowan. Stanford.

Mere sporting books constitute perhaps the dreariest and least attractive department of literature to any but professed sportsmen. The reader, however, of the present work will have no cause to complain. The book is well written and full of interest, the remarks on emigration are sensible and to the point, the information given being practical and evidently the outcome of personal experience. So much indeed is told us on the titlepage, which professes to give "some experiences of an old-country settler, with sketches of Canadian life, sporting adventures and observations on the forests and fauna." So well is this programme carried out that we know of no work within anything like equal compass which contains so much authentic, readable matter about Canada and the outlying provinces.

We select for extract some citations relating to the forests of Canada, which are becoming more and more valuable, on account of the scarcity of timber in the United States:—

"Two things are necessary to the growth of forest trees, viz., a certain degree of summer heat and plenty of moisture. The latter condition they cannot get in the Western States, where the evaporation is more than double the rainfall. Given a certain degree of summer heat, say from 60° to 70°, with plenty of moisture, and the most valuable timber trees will grow to perfection, and will stand almost any degree of winter cold. In Canada the melting snow nourishes the roots, while the hot sunshine playing on the foliage draws up the stems straight and branchless to a great height. In the Pine forests it is not unusual to see trees 6 feet in diameter at the butt, and straight as an arrow, growing to the height of 100 feet without limb or fork.

"Nature's rotation of crops in the forest is an interesting study. Where a deciduous forest has been cut down or destroyed by fire, Spruce and Fir trees rapidly spring up. Where a Pine forest has been destroyed by fire, Blueberries and Raspberries grow in immense profusion for the two or three subsequent seasons; then Cherry, White Birch, Maple, and Popple (American Poplar) commence to make their appearance, shoot up with surprising rapidity, and soon a forest of deciduous trees occupies the site of the ancient Pine forests of the country, relics of which may be seen in the gigantic half-charred stems, thoroughly dried by fire and weather, which remain standing amongst the young green wood for twenty or thirty years. These immense trunks, standing high over the heads of the young forest trees with uplifted arms, and stems blanched white with successive storms and sunshine, look like the ghosts of the forest primeval, and present a weird and rather melancholy appearance.

"In Lower Canada and the maritime provinces Spruce and Fir are the weeds of the country. They seem to spring up everywhere and under any circumstances. They grow equally well in the open or under the shade of larger trees. The latter has often surprised me, knowing the difficulty that is experienced in getting under-cover to grow in English woods. On land that has been left in pasture for a few years, the weeds that grow up, and warn the farmer that his land is ready for the plough, are Spruce and Fir trees. In rocky districts of the lower St. Lawrence and of Nova Scotia, of the Thousand Islands and of the Laurentian Mountains, wherever there is a crack in a rock large enough to hold a thimbleful of soil, there one may see a little Spruce or Fir tree."

The forests exercise a very beneficial effect on the climate both in summer and winter, preventing the too rapid melting of the snow and the consequent

drying up of the loam, which occurs in the Western States of the Union. Hence grass, cereals, Potatoes, Turnips, and the crops of a cool climate flourish, as well as those of a hot climate, such as Indian Corn, Grapes, Peaches, Pumpkins, &c. Spring, when it begins, is no laggard, as with us, but advances rapidly and without interruption.

"So with the crops. The thaw heaves up the surface of the soil into loose mould thoroughly moistened by the melting snows. On this comes a great heat, and the farmer or gardener can see his seed growing. . . . The frost kills the roots of the weeds in winter, and one hoeing in the summer time in Canada is as good as two in England. . . . A comparison between the climate of the United States and of Canada as exemplified by the *physique* and appearance of the people is very strongly in favour of the latter climate. A climate suitable to the forest, as we have seen, is also that one most suitable to the growth of grasses and to the health of cattle. It is also most favourable to man, who appears to benefit by a certain amount of humidity in the atmosphere as much as the forest trees. Thus the natives of the forest regions in North America are robust and ruddy, while those of the prairies and treeless regions are lanky and yellow. The world cannot produce finer specimens of manhood than are to be met with in the backwoods of Canada, more especially in the lumber districts. Canadian-born men are, if anything, taller than the old-country people, and less fleshy. They are hardy, robust, and vigorous, presenting a very striking contrast to their next neighbours."

Animal Products: their Preparation, Commercial Uses and Value. By P. L. Simmonds. Chapman & Hall.

This treatise is, we learn, intended to serve primarily as a descriptive guide to the collection of animal products in the Bethnal Green Museum, and in the next place as a practical treatise on economic zoology for the use of the public in general. The subject-matter is arranged under the heads of wool-producing animals and the products they yield, products of the bovine tribe, of the deer and antelope groups, of fur-bearing mammals, of carnivorous animals, of horses—solid-hoofed and thick-skinned (pachydermatous) animals; of aquatic mammals, such as whales; and lastly, of marsupials, such as the kangaroo and opossum. In the Museum itself the classification adopted is into animal substances used for textile materials, such as wool, silk, feathers, hides, animal substances used for domestic and ornamental purposes, such as bones, tortoiseshell, animal oils and fats, substances used for dyeing in pharmacy and perfumery, &c. On each of these subjects the volume before us contains many details otherwise not readily accessible save in numerous and bulky treatises. Numerous illustrations are given. Many of those of cattle are taken by permission from the pages of the *Agricultural Gazette*. To show the manner in which Mr. Simmonds has treated his subject, we may give the following extract relating to rabbits:—

"RABBITS.—The rabbit (*Lepus cuniculus*), originally a native of Spain, belongs to the same genus as the hare, but differs from it considerably in its gregarious habits, its subterranean mode of life, its whiter flesh, and the less perfect state of the young when first produced.

"'Fancy' rabbits, as they are called, have been kept in this country from the earliest times, being mentioned by Cæsar in his account of Britain. They have been raised from the common rabbit by scientific breeding in many countries, particularly in Persia and Arabia, whence we have derived several of our present breeds. The silver-grey rabbit is much bred for its fur, which fetches a high price in China, and is sometimes used here.

"In France about 60,000,000 of rabbit skins are collected annually. The principal portion are used for their hair, for hat-making, and a few millions for furs, when dyed different shades. More than sixteen different transformations are given to the skins in France, and they are made to assume the appearance of costly furs to suit the tastes and customs of different nations. France works up seven-eighths of the quantity, and Belgium the other eighth.

"The number of rabbits sold in the markets of Paris in 1845 was only 177,000, but in 1860 this number had increased to more than 2,000,000. Taking the number consumed in Paris at a thirtieth of the whole quantity used in the Republic, the total consumption would be about 70,000,000 annually. According to official returns, the average price of a rabbit exceeds 2 francs, so that the value of those consumed annually may be taken at £5,500,000.

"Messrs. Leeding & Co., of Borough High Street, state

that they work up yearly nearly 2,000,000 hare and rabbit skins, nearly all English, for foreign skins do not make such good fur as the English and Scotch. They buy the skins principally from poultryers, marine store dealers, and hawkers. They estimate the number of skins manufactured in this country annually produced and imported at not less than 30,000,000. At an average weight of 2½ lb. each, these would give 35,500 tons of food, and valuing each at but 1s., this amounts to £1,500,000, to which £500,000 more must be added for the value of the skins. The number of rabbits sold by licensed game dealers in the kingdom in 1872 was returned at about 5,200,000, but these are a very small proportion of the total sales.

"It was stated by Lord Malmesbury in the House of Lords in March, 1873, that Mr. Brooks, the salesman in Leadenhall Market, receives weekly from Ostend 1500 cases, each containing 100 rabbits; that one gentleman in Somerset sends to Birmingham 10,000 a-week, to Wolverhampton 3000, and to Nottingham 4000 weekly. Southampton receives in the year about 90,000."

— We doubt whether any other 156 miles of railway in the kingdom affords the traveller so much of beauty and varied interest as the London, Chatham and Dover Railway. That being the case, we have no doubt Messrs. Penrose & Son's *Panoramic Guide* to the railway in question will prove very serviceable. A little more personal experience and less reliance on second-hand statements and indifferently drawn-up guide-books would be desirable in a second edition. The subject is worth all the literary care that can well be bestowed upon it.

— To stem the rising tide of immorality, counteract the deterioration of the Press, induce a healthier tone throughout society, promote the more thorough training of the young in the principles of morality and religion, so as to avoid the spread of superstition on the one hand and infidelity on the other, we must naturally look in great measure to the female part of the community. The little volume entitled *Woman and Her Work in the World*, by Mr. C. R. Cresswell (Hardwicke & Bogue), has with reference to these points a special interest. It is an unusually well written treatise, so that its perusal forms an agreeable recreation, while the author's broad and liberal views, sympathy with whatever is pure and holy, and earnest desire to promote female education and open up modes of profitable employment for women, deserve the fullest consideration. No one wants to turn women into Professors, or into so many Mrs. Jellabys, but there is so much good that might be done which is now left undone for want of knowledge, so much domestic sorrow and misery incurred which might be prevented by fuller knowledge on the parts of wives and mothers, and so much unnecessary loss of power and means in the matter of domestic economy, that we hail any attempt to promote the education of women and improve her social position. It is encouraging to see that progress is being made in this direction. Only recently the University of London has made a great step in advance by throwing open its degrees in all the faculties to women, and that they value the privileges already accorded to them is testified by the numbers and success of the candidates who appear at the various examinations.

— The *Florist* opens this month with a coloured plate representing two of the new border Tulips, *Tulipa Eichleri*, and *T. Hageri*, the former a native of Georgia, with pubescent stem and glaucous leaves, the latter a native of the Greek mountains, with narrow thong-like green leaves. The flower of the first has narrow oblong pointed segments of a crimson colour, the base marked with wedge-shaped dark blue spot, edged with yellow. The flower of the latter has broadly ovate-oblong pointed segments, of a rich crimson colour, with a rhomboid purplish blotch at the base of each. The second plate is devoted to the illustration of the Dymond Peach, a large and handsome mid-season variety, of robust growth, and with fruit of excellent character.

— A *New Elementary Theory of Botany* (*Nouvelle Théorie Élémentaire de la Botanique*) is the title of a work published by Dr. Ecorchard, the director of the botanic garden at Nantes. This new theory is based upon the assumption that each plant is an aggregation of individuals. A lengthy introduction to the external forms of plants, in which an

almost entirely new set of terms are explained and illustrated, leads up to a new system of classification. This consists of a dichotomous key, in which the proposed new terms are used, and by which it is not difficult to "run a plant down" to its proper family—provided always, of course, that you understand the terminology. But here comes the hitch. Probably there never was proposed anything more difficult in the way of compound terms for the beginner, though we are bound to say that most of them are intelligible to the practical botanist. Thus, for example, the classes *Carpocycorollæ*, *Thalamocalyptomœ*, and *Achlamysquamæ*, the orders *Collocarpæ* and *Dialycarpæ*, and the sub-orders *Collostyli-dialystigmatæ* and *Dialystyli-stigmatæ*. These names are drawn from actual characters, which they express fairly well when you know the meaning of the components of these ugly compounds; but we fail to discover the advantages claimed by the author for his system, which he sends into the world with much confidence. As a proof of the utility and practicability of his scheme, he gives a key in his system of classification to the natural orders represented in the Flora of France. It is to be followed by a complete Flora of France, in which his terminology will be carried down to species.

— The seventh edition of Mrs. Somerville's *Physical Geography* (Murray) has been issued in a revised form, so that it now forms a companion volume to the late Sir Charles Lyell's excellent *Student's Elements of Geology*. The original work is an admirable one, and the Editor has done his or her best to make the work a fitting exponent for popular purposes of the science on which it treats. Some portions, however, among them those relating to vegetation, still require a good deal of additional matter to bring them up to date.

— The last issued Part of the *Journal* of the Linnean Society contains the first instalment of Mr. J. G. Baker's *Systema Iridacearum*. Mr. Baker's object is to do for the present time what Bellenden Ker did in 1827, that is, to give a complete synopsis of the genera, and a list of species, with synonyms, references to plates, &c. Mr. Baker gives a brief sketch of the morphology of the order, sufficient for classificatory purposes, and in relation to the geographical distribution admits sixty-five genera and 698 species. More than 300 species are found at the Cape. *Gladiolæ* are confined to the Old World, *Ixiæ* and *Iridæ* are common to Old and New. The genus *Iris* is distributed nearly throughout the world, the exceptions being the tropics of Asia, Polynesia, and America. The main subdivisions of the order are based on the presence of a bulb or a rhizome respectively, the regular or irregular perianth, and the isolation or combination of the stamens. The characters of each genus are given at length, but for the species a list with synonyms and references is alone given.

— The last issued part of M. Baillon's *Histoire des Plantes* is devoted to *Myrtaceæ* and other orders. The woodcuts are beautiful, and the notes on structure valuable. M. Baillon includes under *Myrtaceæ*, true *Myrtles*, *Leptospermeæ*, *Chamaelaucicæ*, *Barringtoniæ*, *Napoleoneæ*, and *Punicæ*. *Hypericæ* come next, and the staminal arrangements, dotted aromatic leaves and other characters, afford reasons for the approximation to *Myrtles*. *Clusiaceæ* come next in order, followed by *Lythraceæ*, a very unusual position. Next in order come *Onagraceæ* and *Balanophoraceæ*.

ON THE SOURCE OF THE CARBON OF PLANTS.

NEARLY half the dry substance of plants is carbon; and it is conclusively established that they derive, at any rate, the greater part of it, directly from the carbon-dioxide of the atmosphere, which the chlorophyll cells have the power of decomposing in sunlight, at the same time evolving oxygen. But this function of vegetation, which is so essential a complement to the processes of animal life, gives rise to many problems hitherto unsolved; and an important one is whether or not plants avail themselves of other obviously possible sources of carbon than that existing in such very small proportion, although in large actual amount, in the ambient air.

Our knowledge bearing upon the subject as it exists

in the present day, is the resultant of careful investigations by many observers. In the last century Bonnet discovered the gaseous exhalation; Priestley that the gas is oxygen; Ingenhousz that the oxygen is only evolved in sunlight; Sennebieur that it is due to the decomposition of carbon-dioxide, but he believed that the carbon-dioxide is taken up in solution in water. Early in this century de Saussure carried out a long series of experiments on the relations between the carbon-dioxide decomposed, and the oxygen evolved, and on the amount of carbon-dioxide in the air compatible with the healthy development of plants. Since his time many eminent names have been added to the list of patient labourers in this field of inquiry.

Boussingault worked on the question whether the carbon-dioxide is absorbed by the leaves or taken up by water through the roots; and by direct experiments proved that the leaves of plants do take up the carbon-dioxide, which is so sparingly, though so uniformly diffused in the atmosphere. His researches led him to conclude that by far the greater part, if not the whole of the carbon which enters into the constitution of the organs of plants, is derived from atmospheric carbon-dioxide; and while drawing attention to the fact that, for healthy and vigorous action, plants require large volumes of air to pass over them, and to the surprising rapidity with which they absorb the carbon-dioxide from it, he makes calculations as to the surface presented to the air by the leaves of different crops. Taking the average number of plants growing per hectare (about 2½ English acres) he estimates that:—

Artichoke gives a surface of	142,410 square metres.
Beetroot	49,921 "
Potato	39,641 "
Wheat	35,499 "

Boussingault also made experiments in regard to the absorption of carbon-dioxide by plants growing under different conditions as to soil and manures. He found that a Helianthus which in twenty-four hours would, without any manure, only decompose 2 c.c. of carbon-dioxide, decomposed 182 c.c. in the same time when supplied with manure containing nitrates and phosphates, 11 c.c. when with nitrates without phosphates, and only from 3 to 6 c.c. when manured with phosphates without nitrates.

That the carbon-dioxide contained in the atmosphere is sufficient for normal vegetation is proved by the abundant growth of Heath and other wild plants on sandy hills; and the numerous experiments on water-culture conclusively show that a plant may grow luxuriantly, and store up an abundance of carbon, when supplied only with mineral salts, in a solution which contains little or no carbon-dioxide.

Sachs speaks of it as an unquestionable fact, "that most plants which contain chlorophyll (for instance, our cereal crops, Beans, Tobacco, Sunflower, &c.) obtain the entire quantity of their carbon by the decomposition of atmospheric carbon-dioxide, and require for their nutrition no other carbon-compound from without." He goes on to say: "The compound of carbon originally present on the earth is the dioxide, and the only abundantly active cause of its decomposition and of the combination of carbon with the elements of water is the cell containing chlorophyll. Hence all compounds of carbon of this kind, whether found in animals or in plants or in the products of their decomposition, are derived indirectly from the organs of plants which contain chlorophyll."

Dr. J. Boehm made direct experiments with seedlings of Scarlet Runner, growing them under glass shades, luted with potass lye, in pots containing in some cases quartz sand moistened with a nutritive solution, and in others garden soil rich in humus. The two sets were quite equal in development and duration of life; those in the garden soil formed quite as little starch as those in the sand; and from this he concluded that the carbon-dioxide yielded by the garden soil had taken no share in the growth of the plants.

Liebig had, however, supposed that plants might owe some part of their carbon to the carbon compounds in the soil, which were absorbed by their roots, and that young plants especially drew their supply from this source. He speaks of the effect of drought as checking the supply of carbon-dioxide by the roots, and throwing the plants exclusively upon that in the air.

But the tendency of more recent investigations points to the conclusion that the atmosphere and the parts of plants living in it are solely concerned in the storing up of the carbon of vegetation.

We may pause for a moment to consider the amount of the carbon so stored up.

Liebig estimated that more than 1000 lb. of carbon may be harvested annually from a morgen of surface—somewhat less than two-thirds of an English acre.

According to the estimates of Lawes and Gilbert, with Wheat for twenty years in succession on the same land, there was an actual yield of 2500 lb. of carbon, per acre, per annum, where no organic carbon compounds were added to the soil, and where these were added (in the form of farmyard manure) the actual yield in carbon was less. With Barley, for twenty years in succession, the average annual yield was 2088 lb. of carbon per acre; and the indication is that some other crops, under similar conditions, acquire even more.

Estimates recently made of the forest growth in Germany give as much as 2700 lb. In tropical climates where vegetable growth is more luxuriant the amounts are far greater; and in the West India Islands as much as from 2½ to 5 tons of carbon may be harvested per acre in the crop of Sugar-cane.

With these large amounts of accumulation on the one hand, we have, on the other, an atmosphere containing carbon-dioxide in so small a proportion as 0.04 per cent.

Then we have to bear in mind the large supplies of carbon-dioxide within the pores especially of manured soils, as determined by Boussingault, and at the disposal of the roots of plants. Also the enormous quantity of water taken up from the soil and passing through plants during growth, probably at any rate more than 200 parts for every part of dry substance fixed, and the fact that carbon-dioxide is present in all natural waters would lead to the supposition that the roots would scarcely either take it up to no purpose, or act as a filter to that which constitutes so important a requirement of the plant.

Dr. Moll* has recently, by some interesting experiments, made a contribution to the evidence which is required to answer the question—Can leaves decompose the carbon-dioxide which is at the disposition of the roots? and argues that the proof that one part of the plant—the leaf—takes up and decomposes carbon-dioxide, is no proof that it is not taken up in another part—the root.

He quotes the experiments of Sennebieur and de Saussure, but considers that they were not made quantitatively, or with sufficient exactness to solve this problem. For its elucidation he rests his methods upon Sachs' theory that the starch in the chlorophyll grains must be considered as the first visible product of the decomposition of carbon-dioxide, and that therefore, according to him, the presence or absence of starch in the leaves is the crucial test of the decomposition or non-decomposition of carbon-dioxide. In Dr. Moll's investigation of the starch contents he used Sachs' modification of Boehm's method.

Five sets of experiments were made to meet the different aspects of the question.

In the first set glass shades were used, in one of which the air was kept free from carbon-dioxide by being luted with potass lye, while the other contained ordinary air, or air with an excess of carbon-dioxide, and was luted with water. The liquid lute was in porcelain dishes, made with a round hole in the middle, the central hole and outer edge being deeply rimmed. The shades, of less circumference than the dishes, were set in them, and were furnished with tubular necks, into which smaller tubes were fixed for the current of air to pass through, and for other requirements of the experiments. The exit tube of the shade in which the atmosphere was kept free from carbon-dioxide was conducted through a test-tube filled with pieces of pumice saturated with potass lye. Preliminary experiments with etiolated plants, with a watch glass containing baryta-water within the shade, satisfied the author that he secured having air absolutely free from carbon-dioxide under that luted with potass lye; and some early failures taught him how to regulate the supply of carbon-dioxide and air in the other shade, so as to grow plants as well-developed and healthy as those in the open air. With thick-leaved plants he found that it was necessary to add as much as 2 per cent. of carbon-dioxide to a volume of air supplied to them of about 2500 c.c. daily, in order to satisfy their requirements for free growth. *Nature*.

To be continued.)

Obituary.

WE regret to hear of the somewhat sudden death of Mr. GEORGE SMITH, of Dunstable and London. Mr. George Smith was the father of one of our most valued contributors, Mr. Worthington Smith, who received his earliest and best directions in the study of art, and in the habit of close observation, from the example of his father. Mr. George Smith was born at Gaddesden Row, Herts, on May 9, 1804; died in London, on July 31, 1877; and was buried at Dunstable.

— The death of Mr. RICHARD WEBB of Calcut, near Reading, on July 26, is also announced. Mr. Webb was the owner of one of the largest and most interesting Nut gardens in the country, and was besides the raiser of several new varieties, which are getting into cultivation. His garden—about 11 acres in extent, surrounded by a brick wall 8 feet high—was, when we saw it last, a perfect thicket of Nut bushes and fruit trees, the produce of which was guarded from the depredations of bipeds by half a dozen or more very powerful mastiffs, and from birds by a score or more of cats of mixed nationalities and breeds—but all favourites of their master, a man of much kindness of disposition.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, AUGUST 8, 1877.

Aug. 2.—The morning was dull, the afternoon was bright at times. Clear night.
 3.—The day was generally dull and cold.
 4.—Dull morning; generally dull till 3 P.M.; fine and bright till 9 P.M. Overcast at night.
 5.—Fine and bright day throughout.
 6.—Warm and fine generally; occasionally dull. Rain at night.
 7.—Warm and dull morning. Showers of rain all day. Cloudless after 11 P.M.
 8.—Dull, and showery morning. Thunder, with heavy rain, afternoon. Showery at night.

LONDON: *Barometer*.—During the week ending Saturday, August 4, in the suburbs of London the reading of the barometer at the level of the sea increased from 30.16 inches at the beginning of the week to 30.32 inches by the morning of July 30, decreased to 29.83 inches by midnight on the 31st, increased to 30.05 inches by the morning of August 3, decreased to 30.01 inches by the afternoon of the same day, and was 30.08 inches at the end of the week. The mean reading for the week at sea level was 30.05 inches, being 0.15 inch above that of the preceding week, and 0.12 inch above the average.

Temperature.—The highest temperatures of the air observed by day were 84° on July 29, 83½° on the 30th, and 86½° on the 31st; on August 1 a great change took place, and the highest temperature was 71½°, and 67½° was the highest temperature on August 4; the mean value for the week was 75½°. The lowest temperatures of the air observed by night varied from 50° on August 3 to 65° on July 29; the mean for the week was 57°. The mean daily range of temperature in the week was 18½°, the greatest range in the day being 26½°, on July 31, and the least 13½°, on August 4.

The mean daily temperatures of the air, and the

departures from their respective averages, were as follows:—July 29, 71°.7, + 9°.4; 30th, 68°.2, + 5°.9; 31st, 71°.8, + 9°.5; August 1, 62°.2, - 0°.1; 2d, 58°.2, - 4°.1; 3d, 56°.9, - 5°.3; and 4th, 58°.9, - 3°.3. The hottest day in the week was July 31, and the coldest was August 3; the difference of mean temperature between these days was 14°.8. The mean temperature of the air for the week was 64°, being 1°.7 above the average of sixty years' observations.

The highest readings of a thermometer with blackened bulb in vacuo, placed in sun's rays, were 144° on July 29, 145° on the 30th, and 151° on the 31st; on August 1 the highest reading was 94°. The lowest readings of a thermometer on grass, with its bulb exposed to the sky, were 49½° on August 2, and 47½° on the 3d; on July 29, 57¼° was the lowest reading.

Wind.—The direction of the wind was S.W. and W.N.W., and its strength brisk. The weather during the first three days of the week was very fine and hot, but dull and cool on the remaining four days.

Rain fell on the 4th; the amount measured was 0.07 inch.

ENGLAND: Temperature.—The highest temperatures of the air observed by day were 86¼° at Blackheath, 86° at Cambridge, 85½° at Norwich, and 83° at Sunderland; these extreme high temperatures occurred on the last three days of July, and were confined to the South and East parts of England, and not shared in elsewhere. At Wolverhampton, Nottingham, and Sheffield 78° was the highest in the week, and at Liverpool 70° was the highest observed. The mean value from all stations was 78½°.

The lowest temperatures of the air observed by night were 42½° at Eccles, 43° at Sheffield, 44° at Leeds and Hull, and 44¾° at Bradford; at Liverpool 51½° was the lowest temperature, 51° at Sunderland, and 50° at Blackheath; the mean value from all stations was 47°. The range of temperature in the week was the greatest at Cambridge, 38°, and the least at Liverpool, 18½°, the mean range of temperature from all stations was 31½°.

The mean of the seven high day temperatures was the highest at Blackheath, 75¾°, Cambridge 75½°, and at Norwich and Bristol both 73¾°, and the lowest at Liverpool, 63¾°, and Eccles, 66¾°; the mean from all stations was 70½°. The mean of the seven low night temperatures was the lowest at Eccles, 49°, and Wolverhampton and Nottingham both 51½°, and the highest at Blackheath, 57°, and Norwich 56°; the mean from all stations was 53½°. The mean daily range of temperature in the week was the least at Liverpool, 9½°, and the greatest at Cambridge, 21¼°; the mean daily range from all stations was 17°.

The mean temperature of the air for the week from all stations was 60½°, being 1¼° higher than the value for the corresponding week in 1876. The highest were 64° at Blackheath, 63° at Norwich, and 62¾° at Cambridge; and the lowest were 56° at Eccles, and 57¼° at both Liverpool and Bradford.

Rain fell generally on one or two days in the week at most places; the amounts measured varied from 1 inch nearly at Nottingham (at which place it fell on six days) to one-hundredth of an inch at Leicester and Leeds; at Brighton and Sheffield no rain fell. The average fall over the country was two-tenths of an inch.

The weather was fine and warm on the last three days of July, but dull and cold on the first four days of August.

SCOTLAND: Temperature.—The highest temperatures of the air varied from 73° at Dundee, and 72¾° at Aberdeen, to 63¾° at Glasgow; the mean from all stations was 69°. The lowest temperatures of the air ranged between 40° at Edinburgh, Dundee, and Paisley, and 45° at Glasgow. The mean from all stations was 42°. The mean range of temperature in the week from all stations was 27°.

The mean temperature of the air for the week from all stations was 56½°, being 3¼° lower than that of England, and 1¼° lower than the value for the corresponding week in 1876. The highest was 57½° at Dundee, and the lowest 54¼° at Glasgow.

Rain.—The amounts of rain measured at the several stations varied from 1 inch nearly at Dundee, to a quarter of an inch at Glasgow; the average fall over the country was four-tenths of an inch.

DUBLIN.—The highest temperature was 80½°, the lowest 43°, the range 37¼°, the mean 59½°; and the fall of rain 0.17 inch.

JAMES GLAISHER.

Variorum.

ARTIFICIAL FRUIT.—These imitations are made of wax. The process is more tedious than that necessary for the construction of flowers, for separate moulds have to be made for each kind of fruit. Plaster of Paris is the best material with which to form the moulds, because it mixes readily with water, and hardens quickly. Put fine, damp sand into a small

basin, and lay down the fruit—say an Orange—which is going to be copied; let half rest below and half remain above the surface of the sand. Prepare the plaster. When ready for it, stir some quickly in a basin of water, and then pour it upon the fruit, and in a few minutes this will be sufficiently hard to remove. Raise the basin with one hand, and let the mould fall gently into the other. Put the half-mould, with the fruit resting in it, into an empty basin (the fruit uppermost), and pour over it freshly-prepared plaster. When the mould is quite hard it is ready for further operations. In a tin saucupan with a spout melt some wax slowly; a lump about half the size of the model will fill the mould once. The wax must not be allowed to boil, or its colour will be spoiled. Put the two half-moulds into hot water for some five or ten minutes; take them out, and gently absorb the moisture with a soft handkerchief. This operation needs speed and delicacy of touch, for if the moulds are not sufficiently hot, the wax will stiffen too quickly, and so will lie in ridges instead of being smooth; and if the moulds are handled roughly, they are easily spoiled. Pour into the hollow of each mould as much wax as will fill the spaces; the wax should not be very hot, or it will cling too determinedly to the mould, and not be willing to leave it. Join the two halves together—exactly and firmly—and then turn them over and over, and hold them in every conceivable position; this treatment will ensure the wax being of equal thickness in every part. When the mould is quite cold, gently separate the halves, and turn out the waxen model. It is well to make several specimens of the same fruit, as they are easily damaged, and also the moulds are liable to be injured when put away for further use. In order to colour the wax, stir some powder, the colour required, into the wax when it is fluid; unless the stirring is continued while the wax is poured into the mould, the colouring matter is liable to settle on the side of the mould. Very beautiful artificial fruits are brought from Jamaica.—From "Cassell's Domestic Dictionary" for August.

THE COOL GREEN SHADE.—A law exists in New York State which may well excite envious feelings in the hearts of all footsore and weary travellers in other parts of the world. This statute is to the effect that any inhabitant liable to highway-tax who transplants to the side of the highway any forest shade trees or fruit trees of suitable size, shall be allowed an abatement of his highway tax amounting to about 4s. 2d. for every four trees. Certain regulations are laid down as to the distances the trees are to be apart. Elms are not to be nearer than 70 feet, Maples and other forest trees not nearer than 50 feet, except Locust trees, which may be set 30 feet apart. Fruit trees are to stand at a distance from each other of at least 50 feet. This is pleasant to read about. Here is a State, not satisfied with providing wayfarers with shelter from the too fierce rays of the sun, but taking care that they shall have Apples and other fruits ready to their hands, and so be no longer tempted to enter the fields to steal raw Turnips. Many a dusty road in our own country might be treated in the same fashion. Good feeling, without the prospect of a remission of taxes, will perhaps prompt some one to make a beginning. From "The Gatherer," in "Cassell's Family Magazine" for August.

HEAD TO FOOT WASHING.—At the recent Domestic Economy Congress, held at Birmingham, Mr. Edwin Chadwick, C.B., said the effect of cleanliness was not sufficiently recognised. He found evidences of its effects in various ways. Dealing with the animal creation, he said the pig that was washed would put on one-fifth more flesh with the same amount of food than the pig that was unwashed. The same effect was observable in other animals. They had seen the horse washed from head to foot to give it additional force. The same argument applied to the human creature. He knew the case of an army hemmed in by the enemy and put upon half rations. They were regularly washed, and it was found after a time that the men who washed were equal in force to those who were unwashed and put upon full rations. Head to foot washing was not only important in the matter of economy in food, but also for the prevention of contagious disease. Nurses who attended scarlatina cases and other cases of contagious disease had found out that, by washing twice a day, and sometimes by changing their clothes, they might withstand the dangers resulting from the practice, and doctors who were similarly engaged had come to the same conclusion. As a defence against an outbreak of epidemic disease he would have the whole population tubbed. He mentioned that in a prison containing 1200 persons washing was enforced, and instead of using 70 or 80 gallons of water for each bath, and causing a large expenditure of time, a very simple method was devised for giving the prisoners a thorough good bath. Each man was placed in a recess, with a spray of tepid water overhead, which completely cleansed him. Schools at which unwashed children attended were centres of children's epidemics. They were well aware of that in Holland, for if it was discovered at any school there that a child had not been "tubbed," it was taken aside, properly washed, and the mother

was admonished that she must not send her child again to school in that condition. There was an enormous sanitary improvement in consequence of that rule being enforced. There had been a marked reduction in epidemic diseases, and be maintained that, in this country, a cleanliness league was quite as important to the population as a temperance league, because filth, intemperance, idleness, and vice went always together.

THE DYMOND PEACH (of which an illustration appears in the August number of the *Florist and Pomologist*) is a fine mid-season Peach, ripening on the open wall about the middle of September. It is a large and handsome fruit, and being at the same time a variety of bardy constitution, a healthy and robust grower, producing fruit of excellent quality, it is a variety which can be recommended for general cultivation. It appears to have been sent out by Messrs. Veitch & Son, of Exeter, some years ago, but to have been since somewhat overlooked, amidst the flood of novelties which has latterly poured in upon us. The fruit is above medium size, roundish, somewhat flattened, with a well-marked suture, and a terminal depression. The skin is finely downy, pale greenish yellow where shaded, marbled and mottled with dull rosy crimson on the sunny side, passing to Venetian red where most exposed. The flesh is greenish white, very slightly stained with red next the stone, from which it parts freely; it is melting and very juicy, with a fine, brisk flavour. A really good Peach, combining size with high quality in its fruit. The leaves are strongly serrated, but bear no glands that we could discover; there are, however, one or two enlarged teeth developed towards the base of the leaf. The healthy robust habit of the tree is of itself a recommendation of no mean value; and altogether the Dymond is a variety which may be planted with advantage. T. Moore, in "Florist and Pomologist."

Enquiries.

He that questioneth much shall learn much.—Bacon.

201. FEATHERY COLUMBINE. — About twenty years ago I had a plant which we called the Feathery Columbine. The flower was cream-coloured, and somewhat like the Queen of the Meadow, the leaves like those of the Columbine; it was herbaceous. As I should like to get it again, can you tell me the botanical name? None of the nurserymen here seem to know it. I may mention that I saw it a year or two since in a cottage garden at Gorebridge. J. G., Edinburgh. [? A *Thalictrum*. EDS.]

Answers to Correspondents.

APRICOTS: T. B. R. We cannot suggest a cause for their cracking, but if the roots are in a damp border that may account for it.

BOOKS: Mrs. Tennant. *The Rose Garden*, by William Paul (Kent & Co.); and Glenn's translation of M. Du Breuil's work on Fruit Trees (Lockwood & Co.).

BROWALLIAS: J. Hakeman. Messrs. Veitch, Henderson, and others, supply seeds of *B. Roehii*, which is the finest of the genus. The old *B. alata* can be obtained at any of the seed-houses.

CURRENTS: J. G. & Co. There is no appearance of insect damage. The roots look as if they had been killed, but by what means we are unable to say. A. M.

FORCING FLOWERS: Amateur. We are sorry we cannot assist you, as nothing can be done beyond keeping them as dry as you conveniently can by means of handlights and similar contrivances.

INSECTS: J. Leman. These are friends, not enemies; they are what are called "false scorpions" (*Pseudoscorpiones*), having, like scorpions, the nippers on the palpi (which look like anterior legs), but no tail nor sting. They are named Chelifer museumorum, the specific name having been given on account of their being met with in museums, &c. They feed upon mites and woodlice, and it is no doubt the small species of the latter which are so destructive to Cucumbers that they were hunting for in the crevices of their stems when taken by our correspondent. A. M.—W. Cocks. The insect found growing on Potato-tops in Boston is the seven-spotted Ladybird, certainly not the Colorado beetle, as you might easily have seen by comparing them with the illustration which appeared in our last two issues.—W. Mair. Immature forms of the common Ladybird—the mortal enemy of green-fly.

NAME OF NUT: O. The Friedled Filbert. NAMES OF PLANTS: W. W. We cannot undertake to ascertain the name of the *Perlargonium*. The Fern is *Pteris serrulata cristata*.—Nemo. We do not recognise the *Statice*. Please send specimens with leaves of both.—H. J., Bristol. *Sedum anglicum*.—J. Hanafy. We believe the name is quite correct; *Veronica salicifolia*.—E. B. Rickells. *Tropaeolum speciosum*.—G. Bath. From the leaves only we cannot be sure, but perhaps it is *C. amara*, and *C. tomentosa*.—Westbrook. 1 and 2, *Agrostis vulgaris*; 3, *Molinia coarctata*; 4, *Poa pratensis*; 5, *Avena flavescens*; 6, *Arrhenatherum avenaceum*. Six is our limit.—K. H. 1, *Agrostis vulgaris*; 2, *Phleum pratense*; 3, *Holcus lanatus*; 4, *Aloupecurus agrestis*; 5, *Holcus mollis*; 6, *Lolium perenne*.—Hayes. The hygrometric Oak,

Avena fatua, and Potamogeton crispus probably; but specimen insufficient.—C. D. F. Avena fatua, the hygrometric Oat.—P. W. J. Stachys palustris.—Symbil. An Acanthus, but we cannot say which without leaves.

POTATOS: E. Stanly. We are quite unable to account for the condition of your Potatoes, which will without doubt all speedily fall into a mass of putrescence. The specimen of Snowflake sent on to us was on arrival large and firm, but one-half the interior (though quite solid) was jet black. The starch was broken up in these places, but only the slightest possible trace of fungus threads could be made out. In twenty-four hours the whole tuber had collapsed into a blackish wet mass, and in thirty-six hours it was highly putrescent and swarming with infusoria. Whether this state of things is caused by the Peronospora or Fusisporium of the Potato we are unable to say with certainty, but many facts seem to point in the direction that the spawn or plasma of fungi may exist in plants in a diffused state like water and without a cell-wall. The corrosive plasma in this condition would appear to spread and destroy all tissues in its course. We are under the impression that the plasma thus diffused is deficient of some condition capable of exciting it into the production of a cell-wall. This is, we imagine, why mycelium proper in the form of threads is often not to be seen.

SWEET WILLIAMS: W. C. The flowers were in bad condition when they reached us. Most of the forms are too rough on the edge to rank higher than mere border flowers, but a crimson with even white edges, and a purple with similar edging, are smoother, and would perhaps, if separately worked onwards, eventually yield some high-class flowers. Light colours preponderate.

VINE LEAVES: W. C. T. The warts on the back of the Vine leaves usually make their appearance in houses that have been kept too close and moist. To stop it you must give more air.

VINES: T. Martin. As soon as the fruit is off and the foliage is well matured—say towards the end of September—and not later than the first week or two in October.

* Correspondents are specially requested to address, post-paid, all communications intended for publication to the "Editors," and not to any member of the staff personally. The Editors would also be obliged by such communications being sent as early in the week as possible. Correspondents sending newspapers should be careful to mark the paragraphs they wish us to see. Letters relating to Advertisements, or to the supply of the Paper, should be addressed to the Publisher, and not to the Editors.

CATALOGUES RECEIVED.—William Paul & Son (Paul's Nurseries, Waltham Cross), Bulb Catalogue for 1877.—Toole & Co. (22, D'Olier Street, Dublin), Catalogue of Dutch Bulbs and Flower Roots, Flower and Vegetable Seeds, &c.—Thomas Meehan (German Town, Philadelphia), List of American Tree Seeds.—Alfred Legerton (5, Aldgate, London, E.), Wholesale Catalogue of Dutch and other flower roots.

ERRATUM.—At p. 152, col. b, in the paragraph on bedding Violas, for "Crown Jewel (Grieve)," read "Crown Jewel, Grievei," Blue Beard, &c.

COMMUNICATIONS RECEIVED.—Stevens & Williams (next week).—R. C. A.—A. Honeyman (next week).—W. C.—B.—H. W. W.—W. G.—A. McL.—J. C.—A Subscriber.—J. S.

Markets.

COVENT GARDEN, August 9.

We have no alteration to report this week, trade being very quiet, and the prices stationary. The Potato market is firm at last week's quotations. The only novelty that has arrived during the week is the Colorado beetle (not alive we are happy to say), specimens of which find a sale at 1s. 6d. each.

PLANTS IN POTS.

Table listing various plants in pots with prices, including Balsams, Bedding-out plants, Begonias, Bouvardias, Calceolarias, Clematis, Cockscombs, Cistus, Cyperus, Dracena terminalis, Ferns, and Ficus elastica.

CUT FLOWERS.

Table listing various cut flowers with prices, including Bouvardias, Calceolarias, Carnations, Cornflower, Eschscholtzia, Eucharis, Gardenia, Heartsease, Heliotropes, Lilies, and Mignonette.

FRUIT.

Table listing various fruits with prices, including Apples, Apricots, Cherries, Currants, Grapes, Lemons, Melons, Oranges, Peaches, Pears, Pine-apples, Strawberries, and Figs.

VEGETABLES.

Table listing various vegetables with prices, including Artichokes, Aubergines, Beans, Carrots, Cauliflowers, Celery, Chilis, Cucumbers, Endive, Garlic, Gooseberries, Herbs, Horse Radish, Leeks, Potatoes, Lettuces, Mint, Mushrooms, Onions, Parsley, Peas, Radishes, Spanish, Rhubarb, Salsify, Shallots, Spinach, Tomatoes, Turnips, and Vegetable Marrows.

SEEDS.

LONDON: August 8.—The seed market was rather better attended to-day than is usual on a Wednesday, owing to the Corn Exchange having been closed on Monday last. No feature of importance was, however, developed; and in scarcely any article was there any quotable variation. For Rape and Mustard seeds for present sowing we have a good demand at full prices. With favourable weather some new samples of Mustard may be expected in about a fortnight's time. The supply of new Rape does not become over-abundant; for the most part the quality of the seed is this year extremely good, but everywhere the yield proves most disappointing. In Clover seed, both red and white, there is just now hardly anything doing. Antwerp articles describe the prospects of the seed crops as follows:—Red Clover, good; Alsike and white, poor; Trefoil, a complete failure. For Trifolium incarnatum there is a moderate sale at last week's currencies. As we get further into August, more samples of new Rye and of Tares come to hand, but values are not yet fixed for either description. There is a brisk inquiry for new large blue Peas; for such, if good, buyers would be readily found. For Canary seed there is now a rather healthier feeling, but no great improvement in the demand is yet perceptible. John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.

CORN.

Monday being a Bank holiday no business was transacted at Mark Lane. Trade on Wednesday was without particular movement, the boisterous weather having little or no effect. Notwithstanding a very fair attendance business was extremely dull, and quotations were only altered where there was any pressure to sell. The tendency, however, as regards spring corn, and especially Oats, was decidedly weaker.—Average prices of corn for the week ending August 4:—Wheat, 65s. 6d.; Barley, 35s. 5d.; Oats, 28s. 7d. For the corresponding week last year:—Wheat, 46s. 8d.; Barley, 31s. 10d.; Oats, 29s. 9d.

CATTLE.

At Copenhagen Fields on Monday there was a fair supply of beasts for the day, and the demand was pretty good. On the average prices were rather better, and a good clearance was effected. American consignments come to hand in good condition. The number of sheep and lambs was small for the time of year. Trade opened active, but became slack towards the close. Quotations:—Beasts, 4s. 6d. to 5s., and 5s. 8d. to 6s. 2d.; calves, 5s. to 6s. 2d.; sheep, 5s. 6d. to 6s. and 6s. 4d. to 7s.; lambs, 7s. to 8s.; pigs, 4s. to 5s.—On Thursday trade ruled quiet. Supplies of beasts and sheep were about the average for a Thursday. The demand was wanting in activity, and quotations were barely as firm as on Monday. Lambs were steady, but not active, and calves and pigs sold at about late rates.

HAY.

The Whitechapel report for Tuesday states that fodder experienced a dull trade at prices much the same as on the previous Saturday. The supply was fair. Prime clover, 100s. to 140s.; inferior, 85s. to 95s.; good new clover, 100s. to 126s.; prime meadow hay, 90s. to 124s.; inferior, 70s. to 85s.; good new hay, 80s. to 100s.; and straw, 44s. to 60s. per load.—On Thursday there was a fair supply of fodder on sale, the trade for which was rather quiet, and prices were unaltered.—Cumberland Market quotations:—Superior old meadow hay, 128s. to 135s.; inferior, 90s. to 110s.; new hay, 80s. to 108s.; superior old Clover, 132s. to 140s.; inferior, 105s. to 115s.; new Clover, 88s. to 120s.; and straw, 57s. to 60s. per load.

COALS.

The Exchange was closed on Monday. A steady business was transacted on Wednesday at the following quotations:—Walls End—Haswell, 20s.; Hawthorns, 18s. 3d.; Lambton, 19s. 6d.; Original Hartlepool, 20s.; South Hetton, 20s.; Tunstall, 18s. 3d.; Hartlepool, 19s.; East Hartlepool, 19s. 6d.; South Hartlepool, 18s. 3d.; Tees, 19s. 9d.

MR. MECHE'S ADDRESS

to his OLD FRIENDS and CUSTOMERS and to the PUBLIC:—"As it has been erroneously supposed by some that I am no longer interested in my London business, I think it desirable to state that I continue to carry it on as energetically, and I trust as satisfactorily to the Public, as formerly, assisted by my only son, who will in due time succeed me. It is now fifty years ago since I first commenced business in Leadenhall Street, and what changes have taken place! Then everybody shaved, and my razor and razor-strop trade was immense; now moustache and beard are the order of the day, and the razor and strop trade is comparatively defunct. Then there were no railways, so people stayed at home and used wooden dressing-cases; now everybody travels by rail, and we have dressing-bags to suit the altered conditions. Fifty years ago the poor geese supplied our pens, and many a now rich merchant in the City will remember the quality of Mechi's shilling pen-knives; but steel pens have extinguished the pen-knife trade and the penmaking machines, and the geese are in peace, except at Michaelmas. In fact, steam has altered, and I may safely say, improved everything, and has made us a nation of travellers both by land and sea. I wonder how much time is now occupied in reading the steam-worked press? and how much less time is occupied in sipping port wine, as we used to do fifty years ago, when we could not travel? Steam will make our 4 lb loaves cheaper some day, just as it has converted calico from 2s. 6d. to 6d. or less per yard. Then, again, a letter which used to cost 6s. 6d. to Cork is now carried for 1d. Sir Rowland Hill richly deserves a monument. But to return to business: fifty years ago, when I first commenced on a small scale, I made it an axiom that what I sold should be good and useful, and I believe thousands who used the strop and paste, which I personally invented, can testify to this; it fact, it was sometimes complained of that I stamped on my razors 'Exchanged if not approved.' I have never, and shall never so long as I live, deviate from that principle, because it is the true means to retain and increase one's connection. I devoted my attention especially to the quality and convenience of arrangements in the dressing bag and dressing case department, and in the tasteful selection of articles suitable for presentation, as well as on the matter of dispatch boxes and writing cases. Although both razors and penknives have 'gone out,' our sportsmen remain, and 'sporting knives' form one of our special departments. I feel firmly convinced that there is no fear of the departure of knives and forks, or dinners, so we make this an important department in quality and price. In conclusion, I ask no favours, but simply desire that my customers should compare the quality and price of my wares with those of other dependable establishments, and form their own conclusions. Most of my worthy assistants and workmen have been nearly forty years in my service, and long ago learned that civility and attention to our customers are as important as good quality in the articles sold. Illustrated catalogues will be forwarded post-free on application."

112, Regent Street, W., opposite Vigo Street.—1877.

TEBBS' UNIVERSAL FUMIGATOR.

For Greenhouses, Conservatories, Ferneries, Frames, Poultry Houses, Infirmeries, Ships, Bed-rooms, &c. Entirely supercedes the use of pots for the purpose. Price 2s. large size 4s. 6d. each. **STEVENS' IMPROVED TRENTHAM
 WROUGHT IRON HORTICULTURAL BOILER,**
 6 feet long by 3 feet diameter, fitted with Inlet and Two Outlet
 Pipes, Fire-door and Grate complete. For price and particu-
 lars apply to
HILL and SMITH, Brierley Hill Ironworks, Dudley.

**STEVENS'
 TRENTHAM GREENHOUSE BOILER,**

After long experience, has proved the most SIMPLE,
 ECONOMICAL, EFFECTUAL, and LASTING BOILER
 extant; recently improved. For Illustrations, with full particu-
 lars, apply to the Sole Makers.

**F. & J. SILVESTER,
 HOT-WATER ENGINEERS, &c., &c.
 Castle Hill Works, Newcastle, Staffordshire.**

Our Boilers are the ONLY ones made with the sanction
 and under the inspection of the inventor, Mr. Stevens—all
 others being base imitations.

AN EXTRAORDINARY BOILER.—

During the Great Boiler Contest at Birmingham, in
 1872, all Boilers were severely tested to prove their respective
 merits. One test was, "How long can each Boiler go without
 Night Attention?" However, one Boiler proved this to a sur-
 prising degree, as after being shut up for twelve hours (from
 9 P.M. to 9 A.M.), it still retained its heat in 1000 feet of 4-inch
 pipes, and yet had more than 1 bushel of fire drawn from its
 furnace in the morning—equal, in point of fact, to seventeen
 hours of continuous firing. What a boon to Gardeners. This
 was THE CHAMPION, Deards' Patent Close-Coil Boiler, for
 Drawings and Prices of which send two stamps to

Messrs. DEARDS, Boiler Works, Harlow,
 who now have their Boilers at work in every county of England
 except three. Amateurs will also find THE WONDER, a
 smaller kind of Boiler, equally as satisfactory, and certainly
 "the best thing" out. Awarded five First Prize Silver Medals.

**AGRICULTURAL LOCOMOTIVES,
 STEAM PLOUGHING MACHINERY,
 ROAD LOCOMOTIVES, TRAMWAY LOCOMOTIVES,
 STEAM ROAD ROLLERS.**

For Prices, Description, and Reports of Working, apply
 to the Manufacturers,

**AVELING & PORTER,
 ROCHESTER, KENT: 72, CANNON ST., LONDON,
 E.C.; and 9, AVENUE MONTAIGNE, PARIS.**

AVELING & PORTER'S ENGINES have gained the highest
 Prizes at every important International Exhibition. The two
 Medals for Progress and Merit were awarded them at Vienna
 for their STEAM ROLLERS and ROAD LOCOMOTIVES;
 and at the last trials of the Royal Agricultural Society of
 England their AGRICULTURAL LOCOMOTIVES gained
 the First Prize after exhaustive trials, when one of their 10-horse
 power Engines, fitted with single slide and ordinary loco-
 motion, indicated 35-horse power, with a consumption of three
 and one-fifth pounds of coal per horse-power per hour.

**JONES' PATENT "DOUBLE L"
 SADDLE BOILER**

These Boilers possess all the advantages of the old Saddle
 Boiler, with the following improvement—viz., the water-space
 at back and over top of saddle, increases the heating surface to
 such an extent that a "PATENT DOUBLE L SADDLE
 BOILER" will do about twice the amount of work with the same
 quantity of fuel; the cost of setting is also considerably reduced,
 and likewise the space occupied; at the same time these Boilers
 are simple in construction, and being made of wrought iron are
 not liable to crack. They are made of the following sizes:—

Sizes.		To heat of 4-in. Pipe.		Price.
High.	Wide.	Long.	Feet.	£ s. d.
20 in.	18 "	18 "	300	7 0 0
20 "	18 "	24 "	400	8 0 0
20 "	18 "	30 "	500	9 0 0
24 "	24 "	24 "	700	12 0 0
24 "	24 "	30 "	850	14 0 0
24 "	24 "	36 "	1,000	16 0 0
24 "	24 "	42 "	1,400	20 0 0
28 "	28 "	60 "	1,800	25 0 0

Larger sizes if required.
 From Mr. CHARLES YOUNG, Nurseries, Batham Hill, S.W.,
 May 29, 1877.

"Having given your Patent 'Double L' Boilers a fair trial
 at my Nurseries, I beg to say that they are most satisfactory.
 I consider them the best in use, and without doubt the most
 economical of all boilers; they will burn the refuse of other
 tubular boilers I have in work."

**PRICE LISTS of HOT-WATER PIPES and CONNEX-
 TIONS**, with Boilers, of all sizes and shapes; or ESTIMATES
 for HOT-WATER APPARATUS, erected complete, will be
 sent on application.
**J. JONES and SONS, Iron Merchants, 6, Bank-side, South
 work, London, S.E.**

Oil Paint No Longer Necessary.

HILL AND SMITH'S BLACK
VARNISH for Preserving Ironwork, Wood, or Stone.
This Varnish is an excellent substitute for oil paint on all out-
door work, while it is fully two-thirds cheaper. It was intro-
duced upwards of thirty years ago by the advertisers, and its
genuine good quality, notwithstanding a host of unprincipled
imitators, is fully attested by its constantly increasing sale. It
may be applied by an ordinary labourer, requires no mixing or
thinning, and is used cold. It is used in the grounds at
Windsor Castle, Kew Gardens, and at the seats of many hun-
dreds of the Nobility and Gentry, from whom the most flattering
testimonials have been received, which HILL & SMITH will
forward on application.

Sold in casks of about 30 gallons each, at 1s. 6d. per gallon,
at the Manufactory, or 1s. 8d. per gallon carriage paid to any
Station in the Kingdom.

UNSOLICITED TESTIMONIAL RECEIVED MAY 3, 1877.
"The Styles, Alderly Edge, Manchester.—Messrs. Hill &
Smith.—Sirs,—For some 20 years I have used your 'Black
Varnish,' and shall be glad if you will forward me another cask,
as I consider it the best thing known for the preservation of all
outdoor work, either wood or iron, that requires to be painted.
—Yours respectfully, ALFRED LOWE, J.P."

Apply to HILL and SMITH, Brierley Hill Ironworks, near
Dudley; and 118, Queen Victoria Street, London, E.C., from
whom only it can be obtained.

CAUTION.—It having lately come to the knowledge of
HILL & SMITH that spurious imitations of this Varnish are
being offered by unprincipled dealers at a slight reduction in
price, they would especially draw attention to the fact that every
cask of their Varnish is legibly marked with their name and
address, without which none is genuine.

Works on Botany, by Dr. Lindley.

DESCRIPTIVE BOTANY; or, THE ART
OF DESCRIBING PLANTS CORRECTLY, in Scientific
Language, for Self Instruction and the Use of Schools. Price 1s

MEDICAL and ECONOMICAL BOTANY;
OR, AN ACCOUNT OF THE PRINCIPAL PLANTS
EMPLOYED IN MEDICINE OR DOMESTIC ECONOMY. In One
Volume, 8vo, with numerous Woodcuts, price 4s.

THE ELEMENTS OF BOTANY, STRUC-
TURAL AND PHYSIOLOGICAL. With a Glossary
Technical Terms and numerous Illustrations. 9s. cloth.

This completes the series of Elementary Botanical Works by
Professor LINDLEY, of which School Botany and The Vegetable
Kingdom form the other parts.

The first two Parts of The Elements of Botany, comprising
Structural and Physiological Botany, and a Glossary of Techni-
cal Terms, are published in one 8vo volume, price 9s.

These three Parts form a complete Manual of Botany for
Medical and other Students who have made themselves
acquainted with the Author's School Botany.

N.B. The Glossary may be had separately, price 5s.
London: BRADBURY, AGNEW, and CO., Bouverie
Street, E.C.

ADVERTISERS are requested to note that
although we do not object to receive Letters to be called
for, we cannot undertake to forward them.

PARTNERSHIP.—A Nurseryman, carrying
on a successful business within 25 miles of London, is
desirous of meeting with a Partner. Failing health causes
Advertiser to wish to find a man, or men who in, say, one or
two years would be able to take over from him the entire busi-
ness. Money would be required, but every facility be afforded
provided substantial guarantees were given. The fullest refer-
ences given and required.—Address, by letter, giving outline
of means and position, NURSERYMAN, Messrs. Norris,
Allens & Carter, Solicitors, 20, Bedford Row, London, W.C.

TO FLORISTS.—The Owner of a Square on the South side of London is desirous of making an arrangement with a Florist for its Care and Management.—Apply to WARING and NICHOLSON, Architects, 53, Parliament Street, Westminster, S.W.

WANTED, a HEAD GARDENER, where seven Men are employed. Chiefly Glass, Salary, £80, with house.—Address, by letter only, to J. MARSH, Esq., 96, Salford Street, Southport.

WANTED, a GARDENER, for Conservatory and Greenhouse, Vines, Fruit, and Vegetables. If married, Wife might act as Laundress, and attend to Poultry, but this is not essential. Assistance given. No perquisites allowed. House and garden provided if married.—Dr. HEALE, Medecroft, Winchester.

WANTED, a good SINGLE-HANDED GARDENER, married; must be thoroughly competent to Manage Vineries and Greenhouse. No Forcing of any Kind. Assistance given.—Wages, 18s. and a cottage.—The Park, Duffield, Derby.

WANTED, near Chislehurst, an UNDER GARDENER, thoroughly experienced, to assist in Garden and attend to two cows.—GARDENER, Mr. Warr's, 62, High Holborn, W.C.

Nursery Foreman.

WANTED, an active, steady Man, of good address, as GROUND FOREMAN; must be well up to the Value and Culture of Fruit Trees, Roses, Evergreens, &c.—Apply, stating age, wages expected, with references, to R. S., *Gardeners' Chronicle* Office, W.C.

Propagator of Roses, Rhododendrons, &c.

PAUL and SON want a clever, experienced Man, as Propagator (Indoors) of Roses, General Hardy Stuff, and Soft-wooded Plants. Efficient help and every encouragement given to a really painstaking Man.—Apply, by letter, to The Old Nurseries, Chessuist, N.

WANTED, an industrious and steady MAN, to take charge of the Flower Garden of a Gentleman living at Canterbury. Bedding Plants and choice Roses chiefly grown. Wages 20s. per week.—CAPTAIN, Mr. Mount, Chemist, Canterbury.

WANTED, a trustworthy MAN, to Grow Bedding and other Plants in three Houses and Pits, and Flower Roots in open ground, at a small branch Nursery; must be honest and industrious, with good references. A single man preferred.—W. FROMOW, Sutton Court Nursery, Turnham Green.

The Seed Trade.

WANTED, a thoroughly energetic and trustworthy Man as MANAGER of the KITCHEN GARDEN and FARM SEED DEPARTMENTS. Must thoroughly understand his business. Unexceptionable references required.—Apply, stating age, experience, wages required, &c., enclosing copies of testimonials, to QUERCUS, *Gardeners' Chronicle* Office, W.C.

WANTED, a Young MAN, under the Foreman, about 25, accustomed to Budding, Grafting, Roses, &c., and General Propagating, Forcing Grapes, Peaches, Cucumbers, &c., and choice Cut Flowers. State wages and references.—M., Merton Abbey Nursery, S.W.

WANTED, a Young MAN, to Assist in Houses; one who is used to Potting and Tying.—The Nursery, 30, High Street, Clapham, S.W.

WANTED, a sober, active MAN, to work in a Market Garden; one who understands the Management of the same. The Advertiser having another business, he would be required to make himself useful.—Reply, stating wages expected, E. B., Post-office, High Wycombe.

WANTED, in a Wholesale Seed Warehouse, a MANAGING CLERK.—Apply, stating age, amount of experience, and where obtained, and wages required, to L. M., *Gardeners' Chronicle* Office, W.C.

WANTED, in the Seed Trade, a CLERK; must be a good Penman.—THOMAS B. THOMSON, Seedsman to the Queen, Birmingham.

Seed Trade.

WANTED, an intelligent, respectable young MAN, with some experience, in a small Retail Shop, and to make out Invoices, &c.—State age, reference, and wages, to JAMES BIRD, Nurseryman, Downham.

WANTED, IMMEDIATELY, a Young LADY, well used to the Bouquet-making, and to serve in a Florist and Seed Shop.—State wages and particulars to J. C. COLLINS, Rose Villa Nursery, Harrogate, Yorkshire.

WANT PLACES.

E. G. HENDERSON and SON have many excellent GARDENERS with approved testimonials for ability now waiting in their Nurseries for reengagement.

E. G. H. & Son will be pleased to answer any enquiries from Noblemen and Gentlemen requiring such.—Pine-apple Nursery, Maida Vale, London, W.

B. S. WILLIAMS, having at the present time several very excellent GARDENERS upon his Register, is desirous of placing them in Situations where great experience and trust are required. B. S. W. would at the same time beg to intimate that when a Gardener is applied for that the filling of the situation should be left with him, as that would prevent unnecessary correspondence and delay.—Victoria and Paradise Nurseries, Upper Holloway, London, N.

Head Gardeners.

JOHN LAING and CO. can at present recommend with every confidence several energetic and practical Men, of tested ability and first-rate character. Ladies and Gentlemen in WANT of GARDENERS and BAILIFFS, or GARDENERS for First-rate Establishments or Single-hand Situations, can be suited, and have full particulars by applying at Stanstead Park and Rutland Park Nurseries, Forest Hill, London, S.E.

GARDENER (HEAD).—Age 36, married, two children; thorough practical experience in all branches of the profession. Four years' character.—T. WOOD, Ansty Manor, Alton, Hants.

GARDENER (HEAD), to any Lady or Gentleman requiring a practical man—Age 33, married; thoroughly competent in the profession, and the Management of a large place.—WILLIAM HARVEY, The Gardens, Horton Manor, Epsom.

GARDENER (HEAD).—Age 32; fifteen years' practical experience in some of the principal places in the kingdom. Three years Head Gardener with the Nobleman he is living with at present.—T. JONES, Little Wryley, Walsall.

GARDENER (HEAD).—Age 39, married; thoroughly understands Vines, Pines, Cucumbers, Melons, Stove and Greenhouse Plants, and Kitchen Gardening. Nine years' good character from late employer. Nineteen years' experience in large establishments. No single-handed place accepted.—T. STEVENS, 11, Warren Road, Reigate.

GARDENER (HEAD).—Age 33, married; thoroughly practical in Early and Late Forcing of all kinds of Fruits, Flowers, and Vegetables; has had sixteen years' experience in good Establishments. Five years' good character.—W. P., 13, Union Place, St. Leonard's Road, Weymouth.

GARDENER (HEAD).—Age 40, married; Scotch; can Superintend the Management of Home Park, Stock, Woods, &c., including Early and Late Forcing, Glass, Ornamental Planting, Improvements, &c.; twenty years' practice in Noblemen's and Gentlemen's situations in the United Kingdom. Good references and recommendation.—R., 12, Devonshire Street, West Kensington, W.

GARDENER (HEAD, WORKING).—Age 36, married; long experience. Good character.—DIXON, The Lodge, Balham House, Balham, S.

GARDENER (HEAD, WORKING).—Has had good experience in all branches of the profession. Two years' good character.—S. B., Post-office, Winkfield, Windsor, Berks.

GARDENER (HEAD, WORKING).—Age 39; thoroughly understands every branch of Gardening—has had several years' practical experience in the Management of Vineries and Orchard-houses. Nine years' in last situation.—W. S., The Gardens, Thornbury Castle, Gloucestershire.

GARDENER (HEAD, WORKING).—Age 35, married, one child (age 5); understands Forcing, Flower and Kitchen Gardening, Land and Stock if required. Five years' good character from present employer.—J. GRIGGS, The Gardens, Highlands, Mereworth, near Maidstone, Kent.

GARDENER (HEAD, WORKING).—Age 36, married; thoroughly practical in all branches of Gardening; no objection to Land and Stock. Nine and a half years' good character.—FRANK CROSS, Down Grange, Basingstoke, Hants.

To Nurserymen and Others.

GARDENER (HEAD, WORKING).—£5 would be given by the Advertiser for a comfortable situation as above. Wages, 24s. or 25s. per week, with cottage, &c. Good references.—A. B., Mr. Covey, Bridge Street, Godalming.

GARDENER (HEAD, WORKING), age 47, married.—A GENTLEMAN wishes to recommend his late Gardener to any one requiring the services of a steady, respectable, and efficient Gardener. Thirty-five years' first-class experience.—A. Z., Mr. Cooper, Elizabeth Villas, Woodford Bridge, Essex.

GARDENER (HEAD, WORKING).—Age 34, married, two children. Twenty years' experience in all departments, nearly four years in last place, from which excellent reference to character and ability can be obtained, or from former situation.—Mr. C. WEMYSS, Land Agent, Cannon Hall, Barnsley, Yorkshire.

GARDENER.—JOHN COWAN, The Vineyard, Garston, near Liverpool, would be glad to recommend to any Nobleman or Gentleman requiring a first-class Gardener a Man in the prime of life, who thoroughly understands the profession in all its branches, having had many years' experience in some of the best places in England and Scotland.

GARDENER (SINGLE HANDED, or where another is kept).—Age 37, married, two children. Six years' good references from last situation.—J. J. BURDETT, Nursery, Maidenhead, Berks.

GARDENER (SINGLE-HANDED or UNDER).—Near London. Good Character.—W. PUSEY, 8, Park Street, Camberwell, S.E.

GARDENER (SECOND), in a Gentleman's Garden.—Age 21; understands Stove and Greenhouse Plants, Vines, Flower and Kitchen Garden. Good character.—F. TRILL, 14, Haldane Road, Fulham, London, S.W.

GARDENER (SECOND).—Age 22; full knowledge of Stove and Greenhouse Plants, Vines, Peaches, &c. Good references.—J. C., St. Catherine's, Guildford, Surrey.

GARDENER (SECOND, or good THIRD), in a Gentleman's Establishment, under Glass.—Age 21; six years' experience. Good character.—Apply, stating wages and particulars, to G. L., Post-office, Devizes, Wilt.

GARDENER and STEWARD.—Understands Timber, Repairs, and General Estate Management. Twelve years' high recommendation from last employer.—JOHN KITTLE, Prospect House, Wells Road, Bath.

GARDENER (UNDER).—Age 18. Two years' good references.—J. P., Atkinson & Wakelin, Booksellers, Alford, Lincolnshire.

GARDENER (UNDER).—Three years' good experience in Gentleman's private Garden. Three years' recommendation.—J. B. Moor Street, Kidlington.

GARDENER (UNDER), in a good place.—Age 20; has had considerable experience.—G. H. M., Mr. W. May, The Gardens, Bayborough House, Taunton.

FOREMAN, or SECOND GARDENER, in a good Establishment.—Age 25. First class references, H. H., 4, Two Court, Pigott Street, Birmingham.

FOREMAN (INDOORS), in a Nobleman's or Gentleman's Establishment.—Age 25; well up in Plants and Forcing. Eight years' good reference from previous and present situation.—G. E., Norton, near Daventry, Northamptonshire.

FOREMAN, in a Gentleman's Garden.—Age 24; has a good general knowledge of the profession; can take Charge of the Houses. Three years' good character.—W. C., Post-office, Wood Green, N.

FOREMAN, in a Nobleman's or Gentleman's Establishment.—Age 24; nine years' good experience. First-class references.—Apply, with particulars, to M. B., 37, Barrow Hill Road, St. John's Wood, London, N.W.

FOREMAN, in a Nobleman's or Gentleman's Establishment.—Age 24; good experience. First-class references.—G. T., The Gardener's, Well Vale, Alford, Lincolnshire.

To the Trade.

FOREMAN.—Age 26; has had twelve years' good experience in all branches; well up in the Cultivation of Palms, Orchids, and Stove Plants. Good character.—J. B., 13, Alma Terrace, Hammersmith, W.

FOREMAN and PLANT GROWER.—Age 40; has had considerable experience in Plant, Cut Flower and Cucumber Growing for the London Markets. Good character, &c.—A. Z., 3, Billington Cottages, Steyne, Acton, W.

JOURNEYMAN, under a good Foreman, in a Nobleman's or Gentleman's Garden.—Young. Good reference.—H. T., 36, Cochrane Street, St. John's Wood, London, N.W.

BUDDER and GRAFTER.—Age 35, single; well up in Layering and General Outdoor Propagating.—S. T., Post-office, Knap Hill, near Woking Station, Surrey.

IMPROVER.—A young Man (age 20), with a few years' experience under Glass, chiefly Orchids and Stove Plants, wishes to get into a large Establishment.—G. E., 9, Forest Road East, Nottingham.

To the Seed Trade.

SHOPMAN or WAREHOUSEMAN.—A young Man, with nine years' experience in good Houses, wishes a situation as above. No objection to travel occasionally. Can give first-class references.—R. V., Messrs. Downie & Laird, Seed Merchants, &c., Edinburgh.

SHOPMAN.—Age 25; ten years' experience in good Houses.—A. D., *Gardeners' Chronicle* Office, W.C.

To the Sseed Trade.

SHOPMAN.—Young; good experience and abilities. Can be highly recommended.—J. C., *Gardeners' Chronicle* Office, W.C.

KINAHAN'S LL WHISKY. Universally recommended by the Medical Profession. A pure old spirit, mild, mellow, delicious, and most wholesome. Dr. Hassall says, "The samples were soft and mellow to the taste, aromatic and ethereal to the smell. The Whisky must be pronounced to be pure, well-matured, and of very excellent quality."—Wholesale to, 20, Great Titchfield Street, London, W.

DINNEFORD'S FLUID MAGNESIA.

The best remedy for ACIDITY of the STOMACH, HEARTBURN, HEADACHE, GOUT, and INDIGESTION; and the safest aperient for delicate CONSTITUTIONS, Ladies, Children, and Infants. DINNEFORD and CO., 172, New Bond Street, London, and all Chemists.

ELLIS'S RUTHIN WATERS.

PURE AERATED WATERS.

ELLIS'S RUTHIN WATERS.—Crystal Springs, Soda, Potass, Seltzer, Lemonade, Lithia, and Gout, Lithia and Potass. Corks branded "R. ELLIS and SON, RUTHIN," and every Label bears their Trade Mark. Sold everywhere, and Wholesale of R. ELLIS and SON, Ruthin, North Wales, London Agents; W. BEST and SONS, Henrietta Street, Cavendish Square.

HOLLOWAY'S PILLS.

Health and Vigour.—To the most regular liver occasional disturbances of digestion will which may be corrected at once by these famous Pills, the alterative and tonic powers of which cannot be too highly extolled. A dose now and then will prove salutary to every one, but a continued course must be taken by the confirmed invalid. It is wonderful how the appetite and digestion improve in proportion as the Pills exert their wholesome influence over the animal economy. They augment muscular strength and mental vigour. Holloway's Pills frequently cure diseases of the digestive organs after all other medicines have failed to afford relief, and they are especially serviceable in disorders of the liver and kidneys.

PAXTON'S CALENDAR.

Now Ready, a New and thoroughly Revised Edition of the

COTTAGER'S CALENDAR OF GARDEN OPERATIONS.

ORIGINALLY COMPILED BY THE LATE SIR JOSEPH PAXTON, M.P.

OPINIONS OF THE PRESS.

"It has been carefully revised by an experienced gardener, and the lists of vegetables, fruit, and flowers have been corrected by the substitution of the most approved modern kinds, in place of those which were mentioned in the first edition, and many of which have ceased to be worthy of cultivation. It is a thoroughly sound, practical treatise; but it has been so long before the public, and so deservedly appreciated, that any special commendation of it now is unnecessary."—*Midland Counties Herald*.

"This is a handy volume, consisting of seventy pages of letterpress and illustration, containing much and varied information likely to prove useful to all cottagers, &c., who possess a garden. To all such, who require a cheap and reliable book of reference, we heartily recommend it."—*Lloyd's*.

"We are quite glad to see this useful little book once more, and it is like a whiff of perfume from the heather in bloom to read on the wrapper 'two hundred and twenty-first thousand.' We advise all who are interested in the promotion of cottage gardening to sow this little book broadcast."—*Gardener's Magazine*.

"The information conveyed in this little book is well adapted for all persons having small plots of ground. The necessary operations for each month are clearly laid down, and are of a thoroughly practical nature. The sorts of both fruit and vegetables are well selected, many of them being excellent in quality. To our readers who are interested in the cultivation of their flower and kitchen gardens, we can safely recommend this as being a most concise and useful work."—*Bell's Messenger*.

THE

IMPROVEMENT OF LANDED ESTATES, DRAINAGE, ENCLOSING, CLEARING, and the ERECTION OF FARM BUILDINGS and COTTAGES.

The Land, Loan and Enfranchisement Co.

(Incorporated by Special Act of Parliament)

ADVANCES MONEY:

1st.—To the OWNERS of SETTLED and OTHER ESTATES, for the Erection of Farm Buildings and Cottages, and for the Drainage, Irrigation, Enclosing, Clearing and General Improvement of Landed Property in any part of the United Kingdom.

2d.—To the OWNERS of SETTLED ESTATES in ENGLAND, for the Erection or Completion of Mansions, Stables, and Outbuildings.

3d.—To LANDOWNERS generally, to enable them to subscribe for Shares in Companies for the Construction of Railways and Navigable Canals, which will beneficially affect their Estates.

4th.—To INCUMBERTS, for the Improvement of their Glebe Lands, by Drainage, and the Erection of Farm Buildings and Cottages.

5th.—To COPYHOLDERS, for the Enfranchisement of Copyhold Lands.

The amount borrowed, with the expenses, would be charged on the Estate benefited, and repaid by a rent-charge, terminating in twenty-five years.

No investigation of the Landowner's Title is necessary. Forms of application, and all other particulars may be obtained of

Messrs. RAWLENCE and SQUAREY, 22, Great George Street, Westminster, S.W. and Salisbury; of Messrs. ASHURST, MORRIS, CRISP, and CO., 6, Old Jewry, London, E.C.; of Messrs. GILLESPIE and PATERSON, W.S., 81A, George Street, Edinburgh, Agents for the Company in Scotland; and at the Offices of the Company, as below.

T. PAIN, Managing Director. EDWIN GARROD, Secretary.

Land, Loan, and Enfranchisement Company, 22, Great George Street, Westminster, S.W.

LION WALK, COLCHESTER.

NEW STRAWBERRIES.

JAMES VEITCH & SONS

Beg to announce that they are now prepared to execute Orders for the two following Strawberries, which are offered by them for the first time, and which they can with confidence recommend:—

LOXFORD HALL SEEDLING.

Fruit large and handsome, conical, occasionally flattened and Cockscomb shaped, seeds prominent, skin bright crimson, flesh firm, juicy, and exquisitely flavoured. This is a seedling raised by Mr. Douglas, of Loxford Hall, from a cross between British Queen and La Constante, and retains the rich flavour of the former with the sturdy robust growth and fertility of the latter. Awarded First Prizes at the Metropolitan Exhibitions.

9s. per dozen; 60s. per 100.

PIONEER (Laxton).

Fruit medium-sized, obovate and conical, seeds rather prominent, very dark red, flesh firm, bright red, of a fine brisk rich flavour; plant of very vigorous growth, a great cropper, and very early. Received a First-class Certificate from the Royal Horticultural Society.

9s. per dozen; 60s. per 100.

All other kinds also ready in small pots, and runners from open ground.

DESCRIPTIVE PRICE LIST ON APPLICATION.

ROYAL EXOTIC NURSERY, KING'S ROAD, CHELSEA, S.W.

TREE FERNS.

THE LARGEST AND BEST STOCK IN EUROPE.

WILLIAM BULL, F.L.S.,

Respectfully invites the Nobility and Gentry to an inspection of the above; also of his

MAGNIFICENT SPECIMEN ORNAMENTAL PLANTS,

Adapted for the Decoration of Conservatories and Greenhouses, or suited for Sub-tropical Gardening.

ESTABLISHMENT FOR NEW AND RARE PLANTS, KING'S ROAD, CHELSEA, LONDON, S.W.

NEW ENGLISH-RAISED SEEDLING ROSES.

**MESSRS. BELL & SON,
THE NORWICH NURSERIES,**

Are now executing orders for their TWO NEW ROSES, raised at their Nurseries, and described and announced below. They have been thoroughly tested here before being sent out, and can be recommended with confidence as really distinct novelties.

CLIMBING ROSE "CATHERINE BELL."

Very large flowers of a deep rose colour, the backs of the petals a delicate silvery pink, of exquisite shape and very fragrant. It is very free-flowering, and of vigorous climbing habit, making shoots 6 feet to 8 feet long in one season. Figured in *The Garden*, March 18, 1876.

"Vour Rose Catherine Bell is both belle et grande."—Rev. Canon Reynolds Hole.

Good Flowering Plants, in Pots, 10s. 6d. each.

COLOURED PLATES ONE SHILLING EACH.

HYBRID TEA ROSE "MRS. OPIE."

Bright salmon-rose, tea-scented flowers, with shell-like petals, a most distinct and novel shade of colour among Tea Roses. It will form a charming companion to Madame Falcot, and will be as extensively cultivated as that variety when well known. In flower from May to November. Figured in the *Floral Magazine*.

Good Flowering Plants, in Pots 7s. 6d. each.

BELL AND SON, 10 & 11, EXCHANGE STREET, NORWICH.

BY SPECIAL WARRANT.

ROYAL BERKS SEED ESTABLISHMENT.

PRICED LISTS POST FREE.

THE "ELIXIR," OR BUFFALO HORN MANURE.

JOHN WILLS, F.R.H.S.,

Is now prepared to supply the above Manure, in large and small quantities, at £44 per ton. There can be no doubt as to the "Elixir" being the very best Manure in present use for general purposes. It is used largely in the Vineyards of France and Italy.

J. WILLS has proved its efficiency on many occasions, at each of his own Establishments, and beyond making these remarks, will say nothing more in its favour, but leave the public to judge for themselves, as to its value, from the following

TESTIMONIALS:

THE "ELIXIR," or BUFFALO HORN MANURE.

"Royal Horticultural Gardens, Chiswick, August 14, 1877.

"Dear Sir,—You ask me my opinion of the Buffalo Horn Dust. I give it you. Early in 1876 Messrs. Taylor & Co., of Clapham, sent a good sample of it here for trial as manure. It has been tried and tested in various ways—in comparison with ordinary stable manure, guano, other patent manures, &c., with most satisfactory results. We have used it, mixed with soil, for potting plants, such as Vines, Peaches, Cucumbers, Fuchsias, Pelargoniums and various others, and as top-dressings in the same manner. Also in the formation of a new Vine border last autumn.

"In each and all cases, the deep green hue which the foliage soon assumes, and the great vigour which is imparted, is very striking and notable. Its light, fibry composure makes it most suitable for mixing with the soil for potting, and when used as top-dressing the roots are soon seen to permeate the entire mass. In the case of the orchard-house trees and Vines so treated the effects are astonishing.

"No manure that we have ever used here has produced results so decided, so apparent and satisfactory.

"I therefore consider the Buffalo Horn Dust to be the most efficient of manures, and intend to use it largely.

"I am, dear Sir, yours very truly,

"Mr. JOHN WILLS."

"A. F. BARRON."

"The Gardens, Heckfield, Winchfield.
June 29, 1877.

"DEAR SIR,—In reply to your enquiry as to what opinion I have formed of the Horn Manure I bought of you some few months ago I am able to report, most favourable. I have used it principally for Pines, Vines, and Strawberries in Pots, and in each case its effects were of the first order. I am so convinced of its superiority over other Bone Manures for Vines that I have used this only in a new border I had to make, and the Vines are making the most magnificent growth. I shall be happy more fully to report results in due course.—I remain, dear Sir, very truly yours, W. WILDSMITH, Gardener to VISCOUNT EVERLEIGH."

"J. WILLS, Esq."

"June 30, 1877.

"DEAR SIR,—I have the pleasure to inform you I have tried your Horn Manure, and the results are most satisfactory. I have mixed it in the soil with such things as Fuchsias, Pelargoniums, Geraniums, Gloxineas, Humea elegans, Neapolitan Violets, and in each case it could be seen at a glance, amongst others that had not any of the mixture, by their stronger and robust habit, a much more green and healthier appearance.—Yours very truly, F. RUTLAND, Gardener to the DUKE OF RICHMOND AND GORDON."

"MR. WILLS."

"The Gardens, Syon House, Brentford,
May 16, 1877.

"DEAR SIR,—I consider your manure an excellent fertiliser: it is clean to use, and, I believe, will be lasting in its effects.—Yours faithfully, JOHN WOODBRIDGE, Gardener to the DUKE OF NORTHUMBERLAND."

"MR. J. WILLS."

"Victoria and Paradise Nurseries, Upper Holloway,
London, N., July 6, 1877.

"DEAR SIR,—I have tried your Horn Manure on Dracenas, Crotons, Ixoras, Grape Vines, and consider it one of the best Manures we have used.—Yours faithfully,

"MR. J. WILLS."

"B. S. WILLIAMS."

"The Gardens, Crewe Hall, June 2, 1877.

"DEAR SIR,—I have tried the New Manure you were so kind as to send me on Fuchsias, Pelargoniums, Marantas, Calladiums, Anthuriums, and other Stove and Greenhouse Plants; and found its effects to be most beneficial wherever it was used. I consider it to be a most excellent Manure, and if it could be supplied in quantity at a reasonable price, would (I have no doubt) be a valuable Manure for Vine borders, as well as Fruit Trees and Pot Vines, Pines, &c.—I am, dear Sir, yours very truly, WM. WHITAKER, Gardener to LORD CREWE."

"MR. WILLS."

"Castle Gardens, Arundel, July 20, 1877.

"MY DEAR SIR,—I don't think I could do better than enclose you the report I had from my foreman about the Manure you kindly sent me. I must tell you that I use a good deal of night soil mixed with the best loam for two years. You should see our Strawberries and French Beans grown in it.—Yours faithfully, JOHN WILSON, Gardener to the DUKE OF NORFOLK."

"MR. WILLS."

"Balsams, scarlet Geraniums, Fuchsias, Crotons, Chrysanthemums, and Coleus made a rapid and vigorous growth, combined with healthy foliage; the Geraniums having a marked improvement in the flowers.—July 20, 1877."

"Cricket Gardens, July 4, 1877.

"DEAR SIR,—I feel great pleasure in sending to you the result of my experience with the Manure you sent to me for trial. I selected four plants, equal in size, of the following sorts:—Geraniums, Fuchsias, French Beans, Cucumber, Balsams, Cockscomb, &c.; two of each sort I potted with a mixture of your Manure, and two of each sort I potted in the usual good soil generally used for such plants. It was quite wonderful to see the difference in the habit and growth of the plants where the Manure was used to the other. I have no hesitation in saying it is by far the best Manure I have ever tried for plants in pots.—I remain, dear Sir, yours faithfully, D. D. DAVIES, Gardener to LORD BRIDPORT."

"MR. WILLS."

"The Gardens, Coombe Lane, Kingston-on-Thames,
June 29, 1877.

"DEAR SIR,—In answer to your enquiry as to the Horn Manure, I beg to inform you that I applied it to some early forced Muscat Vines, that have their roots confined in a very narrow inside border, and the result has been a magnificent crop of Fruit, or what appears to a casual observer perfectly exhausted canes.—I am, dear Sir, yours very truly, WM. DENNING, Gardener to LORD LONDENBOROUGH."

"The Gardens, Harwood House, August 2, 1877.

"DEAR SIR,—I have had great pleasure in giving the sample of your Horn Manure a fair trial. Having potted a many varieties of Greenhouse and other Plants with the quantity you advised me to do, I have noticed them doing well, foliage healthy and green. I don't hesitate the least in saying, the Manure will become a great acquisition to gardeners when better known.—I am, Sir, yours respectfully, JAS. FOWLER, Gardener to the EARL OF HAREWOOD."

"MR. WILLS."

"Leyton, Essex, June 30, 1877.

"DEAR SIR,—In reply to your letter concerning the Horn Shavings you were kind enough to send me for a trial, I found a marked effect on Fuchsias (the only plants that I could try it on, as the others were all shifted). I believe it will prove a powerful Manure, as the quantity I used was only one-eightieth.—With kind regards, I remain, yours very truly,

"MR. J. WILLS."

"JAMES SWEET."

"Mentmore, Leighton Buzzard, July 3, 1877.

"DEAR SIR,—I consider your Horn Manure a very valuable material for mixing with soils for potting purposes. I have used it for various kinds of plants, and the effect is very apparent in the dark green of the foliage and robust health of the plants, which were potted in soil mixed with your Horn Manure.—I am, dear Sir, yours truly, J. SMITH, Gardener to BARONESS ROTHSCCHILD."

"TO MR. WILLS."

J. WILLS BEGS TO SAY THAT HE HOLDS THE ENTIRE STOCK OF THIS MANURE.

JOHN WILLS, F.R.H.S.,

(BY SPECIAL APPOINTMENT NURSERYMAN, FLORIST, AND BOUQUETIST TO HER MAJESTY AND THE ROYAL FAMILY),

ROYAL EXOTIC NURSERY AND WINTER GARDEN,
ON SLOW CRESCENT, SOUTH KENSINGTON, LONDON, S.W.

BOULTON & PAUL,

HORTICULTURAL BUILDERS,
NORWICH.

No. 75.—MELON FRAMES and FORCING FRAMES.

The largest Stock in the Kingdom, ready to be despatched on receipt of order.

These Frames are made of the best red deal, thoroughly seasoned, and fitted by first-class workmen: 24 in. high at the back, 13 in. high in front; painted three coats of good oil colour, glazed with best 21-oz. glass, every pane of which is nailed in and bedded in with putty—the best method of glazing known, and adopted by the most eminent Builders and leading Nurserymen (see *The Garden* for January 13, 1877, p. 30). Iron handles to each light, and an iron strengthening bar across. Each light is 6 ft. by 4 ft., and 2 in. thick.

CASH PRICES (Carriage paid).

	Length.	Width.	L. s. d.
1-light frame ..	4 feet	6 feet	1 17 6
2 " " " "	8 feet	6 feet	3 5 0
3 " " " "	12 feet	6 feet	4 17 6
4 " " " "	16 feet	6 feet	6 7 6
5 " " " "	20 feet	6 feet	7 17 6
6 " " " "	24 feet	6 feet	9 7 6

Special Notice.—Carriage paid to any Railway Station in England. Also to Dublin, Glasgow, and Edinburgh, on Orders of 40s. and upwards.

PIT LIGHTS and SILLS for BRICK WALLS on EARTH BANKS.

PIT LIGHTS AND FRAMES.

Complete for fixing on Brickwork, made in two sizes of lights to work 6 feet by 4 feet 2 inches thick, 7 feet 6 inches by 4 feet 2½ inches thick, lights glazed with 21-oz. British sheet glass, painted four times, sills 4½ inches by 3 inches, with bearers and parting pieces complete, with screws, wrought-iron handle to each light, and strengthening bar across.

CASH PRICES.

Carriage paid to any Railway Station in England and Wales, also to Edinburgh, Glasgow, Dublin, Belfast, or Cork.

SILLS or FRAMES.

	L. s. d.
With 2 lights, 6 feet by 4 feet, 8 feet long by 6 feet wide	2 16 0
With 3 lights, 6 feet by 4 feet, 12 feet long by 6 feet wide	4 3 0
With 4 lights, 6 feet by 4 feet, 16 feet long by 6 feet wide	5 10 0
With 2 lights, 7 feet 6 inches by 4 feet, 8 feet long by 7 feet 6 inches wide	3 10 0
With 3 lights, 7 feet 6 inches by 4 feet, 12 feet long by 7 feet 6 inches wide	5 2 0
With 4 lights, 7 feet 6 inches by 4 feet, 16 feet long by 7 feet 6 inches wide	6 14 0

Longer lengths at cheaper rates.

PRICES ON APPLICATION.

Breakage seldom occurs. Should any glass be broken, we will send sufficient to replace it, carriage free.

Catalogue of every description of Horticultural Building, post-free, 24 stamps.

PLANT PRESERVER LISTS. MELON FRAME LISTS. GREENHOUSE LISTS, POST FREE.

B. S. WILLIAMS'
NEW AND CHOICE

FLOWER SEEDS FOR 1877.

CALCEOLARIA, Williams' Superb Strain, 5s., 3s. 6d., 2s. 6d., and 1 6

From Capt. COSENS, Aberystwith, May 13, 1877.
"The Calceolarias, from the seed Capt. Cosen had from Mr. Williams last year, have been greatly admired—they leave nothing more to be desired."

PRIMULA, Williams' Superb Strain, Red, White, or Mixed 5s., 3s. 6d., 2s. 6d., and 1 6
PRIMULA SINENSIS FIMBRIATA COCCINEA (new), colour brilliant scarlet with bright sulphur eye, exquisitely fringed and of great substance 5 0

From Mr. F. DENNING, Gardener to J. Fenton, Esq., Yardsley, February 26, 1877.
"Dear Sir,—I may inform you that at the Birmingham Chrysanthemum Flower Show, held last November, I took the 1st prize, with twelve Primulas, six red and six white, in the Gentlemen's Gardeners' Class, with seeds supplied by you."

CINERARIA, Weatherill's Extra Choice Strain, 5s., 3s. 6d., 2s. 6d., and 1 6

From Mr. J. WEST, Gardener, Chaddon Park, May 21, 1877.
"Sir,—Your strain of Cinerarias, which have now been in bloom some time, have been and are now the admiration of all that have seen them, and are considered by gardeners to be the best ever seen in this neighbourhood. Habit very dwarf and compact, quite equal to the drawing in your catalogue."

CYCLAMEN PERSICUM GIGANTEUM (new) 2s. 6d., and 5 0
Do., do., Williams' Superb Strain, 5s., 3s. 6d., 2s. 6d., and 1 6

VICTORIA and PARADISE NURSERIES,
Upper Holloway, London, N.

SATURDAY, AUGUST 18, 1877.

STONEHENGE.

YOU cross the thin-skinned Wiltshire hills from Salisbury, perhaps, and past the mound and fortress of Old Sarum, and find yourself on Salisbury Plain—a wide expanse of turf, patched here and there of late years with ploughed fields. Presently you see in the distance a group of objects, larger and browner than sheep, and motionless upon the plain. These are the stones of the pre-Roman temple of Stonehenge—the egg, as Emerson very aptly said, from which all our English churches have proceeded.

This first of British temples stands, in impressive solitude, as mysterious as Troy, without recorded history, and at present without a Homer to invent for it a story. Within a circle of 3 miles about Stonehenge there are 160 mounds or barrows, green bosses on the plain. The other objects round about may be a haystack, and perhaps a shepherd every mile or two, tending his sheep. There are now ninety-four stones, diminished from the supposed 160 of the original temple. We know little more of this surprising monument than sight and surmise have revealed. It is composed of several broken circles. The outer circle, when complete, appears to have been built on the simple plan of uprights connected by a lintel. Its remaining stones are all of the hard, native sandstone, called grey wether, from the Marlborough Downs. It has been said that of all these blocks the sacrificial stone is alone capable of resisting fire. Those of the now broken and much confused inner circle, are of igneous rock, generally syenite; and there are three stones of the ruined inner ellipse of greenstone, and one of hard siliceous schist, all of which may have been obtained in Pembrokeshire and Carnarvonshire; but how did the barbarians of 2000 years ago, or more, manage to transport them? The question occurred to Sir Philip Sydney, when writing his *Arcadia* at Wilton House. He says in simple verse:—

"Near Wilton sweet, huge heaps of stones are found,
But so confused that neither any eye
Can count them just, nor reason reason try
What force brought them to so unlikely ground."

The larks are generally soaring and singing here, on fine days, after January; and Mr. Emerson's companion, on a visit here, a certain Mr. "C." is reported to have solaced himself with a cigar, not knowing how to sing, and to have remarked sententiously, with his back against a large flat stone—for there was a good deal of wind that day—"the larks which were hatched last year, and the wind which was hatched many thousand years ago!" The grand entrance of this roofless temple is placed exactly north-east, as all the gates of the old cavern temples are.

The visitor will observe that the builders of our British Sphinx understood the simple and primeval method of forming a joint by means of the tenon and mortise. He may not perhaps discover much else unaided. The writer's discoveries, it appears, are all wrong. It may be so; some other interpretation may be put on what he saw, but he certainly made out what seemed to him the traces of an early and extensive scheme of geometric gardening, marked upon the downs, without and about the temple.

This idea, however, has not occurred to the

antiquarians, who find in these obscure marks an "avenue or *via sacra* and a *curvus*," the former being the entrance to the cluster of stone circles and the latter a hippodrome. What they call an avenue is what gardeners might call a ribbon, the turf of which is slightly raised, and extends 594 yards in a straight line from the grand entrance. It then divides into two branches which lead, severally, to a row of barrows and to the *curvus*, which might have been at one time an extensive bowling green. This beautifully flat and artificially formed lawn is half a mile north-east of Stonehenge. It is 3036 yards long by 110 yards broad, and bounded by banks and ditches. This would fit in well with horticultural arrangements.

Then there are the "outer" and "inner" circles at Stonehenge: these are the very words of the best authorities, and so in the Régent's Park there is the "outer circle" embracing the whole, and the "inner circle" which surrounds the Botanic Gardens, that plot of 18 acres only which is so much magnified in appearance by the skilful hiding of the boundaries and by admirable landscape gardening. One cannot, but observe these similarities, and it is a refreshing thought that the great heathen temple, where human life is supposed to have been taken on the "sacrificial stone," may have been, after all, a place of innocent recreation, partially devoted by the Druids to horticultural purposes.

There is always a difficulty about ruins. In the gardens just referred to, if we may notice the rockwork, which is imperfect for want of more dignified materials, many persons must have admired the admirable arrangement of the clinkers and fused bricks. Clearly these piled heaps are rockwork though they are formed of spoiled bricks; but imagine the little ruin down, its arches broken, and its Periwinkle torn away—what sort of building would you think had stood there previous to its misfortune? It would be quite impossible to surmise; nor could you tell, in the absence of records, who built it. You might suppose it the work of a committee. You might guess that sandstone and granite were not within their reach. You might imagine the materials were conveyed in carts, and had not travelled far. But this would be all guesswork; as in the case of many an antiquarian discourse about Stonehenge. The inventive Geoffrey of Monmouth entered Stonehenge in his romantic history as a monument set up in honour of some British nobles slain on this spot by Hengist. Inigo Jones explained it as a Roman work. Davies maintains it, in his *Celtic Researches*, to be identical in style and design with the East Indian temples of the sun. Stukeley commits an heroic anacronism, and speaks of "the Deity who made the world by the scheme of Stonehenge." The *curvus*, he considers, stretches across the plain like a line of latitude upon the globe, and the meridian line of Stonehenge passes exactly through the middle of the *curvus*. The Druids, according to Stukeley, were of Phœnician origin, and possessed the magnet, and a knowledge of astronomy and geometry. Mr. Brown, a local antiquary, placed Mr. Emerson on the "sacrificial" stone, and bade him notice from that position that the top of the "astronomical" stone ranged with the sky line. He then informed him that the sun rises, at the summer solstice, exactly over the top of that stone. In other Druidical temples there is an "astronomical" stone in the same relative position.

There is a legend of Salisbury Plain that Stonehenge was built by a certain personage, whose doings were watched by a friar. While putting the great stones together in this solitary place, and talking to himself (as solitary workers sometimes do), this very busy personage observed that the method of his working would

always remain a puzzle. "That's more than thee can tell!" cried the Friar, in the usual Wiltshire dialect. The moment the incautious words were uttered he fled for his life. A great stone, now lying apart from the area of the building, followed him, and has since been called the Friar's Heel.

We spoke of guesswork, but the guesswork of the learned is something more, and an intense interest attaches to their explorations of the sources of language, history, or religion. It is significant that the old Gaelic word for a stone circle of the Stonehenge type is *clachan*, which means, as every traveller in the Highlands knows, a church. *H. Evershed.*

PLANT PORTRAITS.

ANEMONE FULGENS, *Rev. Hort.*, 1877, p. 270.—A coloured figure of this very beautiful scarlet Anemone.

× AQUILEGIA CÆRULEA HYBRIDA, *Floral Magazine*, tab. 271.—A charming hybrid raised by Mr. Douglas from *A. cœrulea*, crossed with *chrysantha*. The sepals are pale violet coloured, the petals primrose yellow. When shown at the Royal Horticultural Society these flowers deservedly excited the greatest attention.

AZALEA IMBRICATA, *Illustr. Horticult.*, t. 281.—This is the double white Azalea, of which we gave an illustration at p. 817, vol. v.

CARISSA GRANDIFLORA, A. D. C., *Bot. Mag.*, tab. 6307.—A very pretty evergreen bush with white fragrant, salver-shaped flowers, 2 inches across, deep green leaves, and forked axillary spines. It is a native of Natal, whence it was introduced by Mr. Cooper. The fruit is used by the natives. It requires warm greenhouse treatment. It flowered at Kew in May.

CEROPEGIA BARKLYI, Hook. fil., *Bot. Mag.*, t. 6315.—A species with a tuberous root-stock, climbing stems, opposite lanceolate white-veined leaves; and flowers scarcely 2 inches long, with a narrow, curved, pinkish tube, dilated into a globose base, and expanded above into a funnel-shaped limb, divided into five long filiform segments, coherent at the incurved tips. It was sent by Sir Henry Barkly from the Morley Mission Station in the Transkei district to Kew, where it flowered in May.

CROCUS ALATANICUS, Semenov., *Gartenfl.*, t. 906.—A spring-flowering Crocus, with fibromembranous coats; linear leaves, with a central white band; small white flowers, with an orange eye; and the outer surface of the sepals marked with delicate purple striations. Native of the mountains of Alatan.

DENDROBIUM WARDIANUM, *Ill. Hort.*, t. 277.—The form here represented is the slender-stemmed one, in which the nodes are not prominent, and the flowers, generally speaking, inferior to those of the knotted variety. The difference is accounted for, according to M. André, by the fact that the original importations came from Assam, the latter from Burmah.

DOUBLE PYRETHRUMS, *Floral Mag.*, t. 271.—Three forms of Duchess of Edinburgh, rosy lilac; Amethyst, lilac; and Placida, white. The flowers are very double, globose, and likely to be effective *en masse*; but individually they are too formal to be beautiful.

EPIDENDRUM SOPHRONITIS, Rehb. f., *Bot. Mag.*, t. 6314.—Described in our columns in 1867, p. 655. It is a native of Peru, and flowered in June from specimens received from M. Linden. The flowers are in groups of two—three, each 1½ inch in diameter, yellowish green, mottled with violet; lip tongue-shaped, with a green edge and a purple tip.

HEMITELIA GUIANENSIS, var. PARADÆ, *Illustr. Hort.*, t. 280.—A Tree Fern, with trunk of moderate height, clothed with adventitious roots. The young fronds are covered with grey pubescence, which is lost as the plants get older. The petioles are grooved, and are provided at the base with short prickles. The fronds, 9 feet high, are bipinnate, with opposite sessile pinnae. The variety is one of M. André's discoveries.

HYBRID BEGONIAS, *Ill. Hort.*, t. 278.—This is a plate representing flowers of five varieties of tuberous Begonias, viz., Souvenir de Louis van Houtte, Benj. Williams, Meirsschaert, Fr. Desbois, and Comtesse de Gomer, all except the last, which is white, have

flowers of various shades of red, but varying much in size and breadth of petal.

KNIPHOFIA QUARTINIANA, Richard, *Gartenfl.*, t. 907.—An Abyssinian species, like the old favourite Tritoma, but with broader recurved leaves and spikes of orange-yellow flowers.

DESTRUCTIVE INSECTS' BILL.

THE following Bill for preventing the introduction and spreading of insects destructive to crops, has passed both Houses of Parliament:—

GREAT BRITAIN.

1. The Lords and others of Her Majesty's Most Honourable Privy Council (in this Act referred to as the Privy Council) may from time to time make such Orders as they think expedient for preventing the introduction into Great Britain of the insect designated as *Doryphora decemlineata*, and commonly called the Colorado beetle.

Any such Order, if the Privy Council think fit, may prohibit or regulate the landing in Great Britain of Potatoes, or of the stalks and leaves of Potatoes, or other vegetable substance, or other article, brought from any place out of Great Britain, the landing whereof may appear to the Privy Council likely to introduce the said insect into Great Britain, and may direct or authorise the destruction of any such article, if landed.

If any person lands or attempts to land any article in contravention of any Order under this Act, such article shall be liable to be forfeited in like manner as goods the importation whereof is prohibited by the Acts relating to the customs are liable to be forfeited; and the person so offending shall be liable, according to those Acts, to such penalties as are imposed on persons importing or attempting to import goods the importation whereof is prohibited by those Acts.

2. The Privy Council may from time to time make such Orders as they think expedient for preventing the spreading in Great Britain of the said insect.

Any such Order may, if the Privy Council think fit, direct or authorise the removal or destruction of any crop of Potatoes or other crop or substance on which the said insect in any stage of existence, is found, or to or by means of which the said insect may appear to the Privy Council likely to spread, and the entering on any lands for the purpose of such removal or destruction, or for the purpose of any examination or inquiry authorised by the Order, or for any other purpose of the Order.

Any such Order may, if the Privy Council think fit, prohibit the selling, or exposing or offering for sale, of living specimens of the said insect, in any stage of existence, or the distribution in any other manner of such specimens.

Any such Order may impose penalties for offences against the Order, not exceeding £10 for any offence; and those penalties shall by virtue of this Act be recoverable, with costs, on summary conviction before two justices of the peace, and shall be applied as penalties recovered under the Contagious Diseases (Animals) Act, 1869, are applicable.

3. Where by any order under this Act, the Privy Council direct or authorise the removal or destruction of any crop, they may direct or authorise the payment by the Local Authority of compensation for the crop; and the Local Authority shall pay the same, subject and according to the following provisions:—(1). In the case of a crop on which the said insect, in any stage of existence, is found, the compensation shall not exceed one-half of the value of the crop. (2). In every other case the compensation shall not exceed three-fourths of the value of the crop. (3). The value of the crop shall in each case be taken to be the value which, in ordinary circumstances, the crop would have had at the time of its removal or destruction. (4). The Local Authority may, if they think fit, require the value of the crop to be ascertained by their officers or by arbitration. (5). The Local Authority may, if they think fit, withhold compensation if, in relation to the crop, the owner or the person having charge thereof, has, in their judgment, done anything in contravention of, or failed to do anything in compliance with, any Order under this Act.

4. The Local Authorities under the Contagious Diseases (Animals) Act, 1869, with their respective districts, local rates, clerks, and committees, shall be, in like manner, Local Authorities for the purposes of this Act.

The Privy Council may, if they think fit, require a Local Authority to carry into effect any Order of the Privy Council under this Act.

The expenses incurred and compensation paid by a Local Authority in pursuance of any Order under this Act shall be paid by them out of the local rate.

Every Local Authority shall keep, in such manner and form as the Privy Council from time to time by Order

direct, a record relative to proceedings in pursuance of any Order under this Act, stating the date of the removal or destruction of any crop or substance, and other proper particulars, which record shall be admitted in evidence.

5. Every Order of the Privy Council under this Act shall be published, if it relates to England, in the *London Gazette*, and if it relates to Scotland, in the *Edinburgh Gazette*; save that, where the Order affects only specified lands, the insertion in the *London* or *Edinburgh Gazette* (as the case may require) of a notice of the making of the Order shall be sufficient.

Any Order of the Privy Council under this Act shall be published by any Local Authority, to whom it is sent by the Privy Council for publication, in such manner as the Privy Council direct, and subject to, or in the absence of, any such direction, in such manner as the Local Authority think sufficient and proper to insure publicity.

6. The powers by this Act conferred on the Privy Council may be exercised by any two or more of the Lords and others of the Privy Council, and, as regards the making of Orders affecting only specified lands, may be exercised by the Lord President or one of Her Majesty's Principal Secretaries of State.

IRELAND.

7. The foregoing provisions of this Act shall apply to Ireland, as if Ireland were named therein instead of Great Britain, but subject to the provisions of this section: (1). The powers conferred on the Privy Council shall be vested in the Lord-Lieutenant, or other chief governor or governors, of Ireland, acting by the advice of her Majesty's Privy Council in Ireland. (2). The Local Authorities shall be the boards of guardians of the several poor-law unions. (3). The expenses incurred and compensation paid by a Local Authority shall be paid by the treasurer of the union out of union funds; that is to say, out of any money in his hands, to the credit of the guardians of the union, and if there is not sufficient money in his hands, then out of the money next received by him and placed to their credit. (4). Penalties (other than penalties recoverable under the Acts relating to the Customs) shall be recovered in a summary manner, and shall be applied according to the provisions of the Fines Act (Ireland), 1851, and any Act amending the same. (5). Orders shall be published in the *Dublin Gazette*.

GENERAL.

8. Every Order under this Act shall be laid before both Houses of Parliament within ten days after the making thereof, if Parliament is then sitting, and if not, then within ten days after the next meeting of Parliament.

9. The expenses of the execution of this Act, other than expenses and compensation paid by Local Authorities, shall be paid out of money to be provided by Parliament.

10. This Act may be cited as the Destructive Insects Act, 1877.

THE ROYAL GARDENS, KEW.

(Concluded from p. 168.)

TOBACCO.—The manufacture of cigars in Jamaica, which, as stated in my reports for 1871 and 1873, owes much, if not everything, to the exertions of the late Governor, Sir John Peter Grant, in conjunction with this establishment, has already attained great importance; the supply which in former years sufficed only for consumption in the island being now so great, that a large sale is steadily maintained in London. I can only repeat what I have urged in so many reports, that well-directed efforts on the part of West Indian colonists, especially if stimulated by such enlightened governors as the one I have just mentioned, cannot fail to be remunerative.

Tobacco and cigars have also been sent to Kew for report by His Excellency William Robinson, the Governor of the Bahamas. Although not at present fulfilling the conditions necessary for being readily saleable in the English market, the report obtained upon them was not without promise.

Our attention has been drawn to the precise nature of the well-known Lattakia Tobacco. With the kind assistance of Mr. G. J. Eldridge, Her Majesty's Consul-General at Beyrout, and of Dr. Post, Professor of Botany in the Syrian Protestant College, it has been ascertained that the plant cultivated in the Lattakia district is not, as generally stated, identical with Turkish Tobacco (*Nicotiana rustica*), but is a variety of *N. Tabacum*, while it owes its peculiar qualities to being exposed during the process of curing to the smoke of various species of Oak wood. A note on the subject has been communicated by Mr. Thistleton Dyer to the *Journal of the Linnean Society* (Botany, vol. xv., pp. 246, 247).

At the request of His Excellency Sir W. Jervois, Governor of the Straits Settlements, seed of Lattakia, Maryland, Virginia, and Orinoco Tobacco have been procured and forwarded to Singapore for cultivation in that colony. A similar collection has also been sent to the Governor of the Bahamas.

The whole of the museums are in a most crowded condition. No. 1 has long been waiting for the relief which throwing out the staircase at the back would give to it. No. 3 contains quite as many objects as there is room to properly display, having regard to the necessity of preserving proper thoroughfares on crowded days.

The collection of specimens illustrating vegetable teratology and pathology is steadily developing, and has been largely added to by gifts, especially from Miss Ormerod and Dr. Masters. It will soon require the entire space of the room in which it is at present placed.

Dr. Hugo Müller has published, in German, an exhaustive and most valuable treatise on paper materials amongst the reports of the Vienna Exhibition. Dr. Müller largely availed himself of the resources of the Kew museums during its preparation. It will no doubt long remain the standard authority on the subject, and I trust that a translation may be published for English use.

H.R.H. the Prince of Wales most graciously placed at our disposal the large collections of fruits, seeds, woods, &c., collected during his Indian tour. These specimens were materially enhanced in value for the purposes of our museums by H.R.H.'s expressly stipulating that we should be entirely free from any conditions in introducing the specimens into our arranged collections.

PHYSIOLOGICAL LABORATORY.—The physiological laboratory which the Royal Gardens owe to the munificence of T. J. Phillips Jodrell, Esq., M.A., and the commencement of which I reported last year, has been completed, and though as yet only partially provided with the necessary equipment, has been already used by Dr. Tyndall in researches on the conditions by means of which the minute organisms (Bacteria), the germs of which are always present in the air, and which determine putrefactive changes in infusions of organic substances, can be effectually excluded from them (*Proceedings of the Royal Society*, Jan. 18, 1877). I have the satisfaction of stating that the internal arrangements of the building, which were intrusted to the Assistant Director, have been pronounced by both English and Continental authorities to be (considering the size) more convenient than those of any other establishment of the kind known to them.

Two other physiological researches have been carried on at Kew during the past year, although the laboratory was not sufficiently advanced to be available for them. Professor Bardon-Sanderson has continued his examination of the electrical phenomena of the leaf of Venus' Flytrap—*Dionæa muscipula* (*Proceedings of the Royal Society*, Dec. 14, 1876), and Mr. S. H. Vines, Fellow of Christ's College, Cambridge, has studied the digestive ferment of *Nepenthes* (*Journal of the Linnean Society*, vol. xv., pp. 427—431).

I may also mention here that leaves of *Chamærops humilis* have been supplied to Dr. Hugo Müller, F.R.S., for the purposes of an investigation, which has led to the detection in them of a peculiar sugar, Quercite, the occurrence of which in Palms was altogether unknown.

HERBARIUM.—The new building for the accommodation of the herbarium is in a very advanced state. It will consist of a hall attached to the back of the present house. The whole of the latter will be preserved, except the drawing-room, a single apartment that was added on to its north side, and which has been removed to make room for the new hall, which is 86 feet long by 40 feet broad, and contains two galleries 10 feet broad running round it. The galleries will communicate with each other and with the ground floor by two circular iron staircases placed one at each end of the building. On each floor there will be an entrance from the old building, closed by double iron fire-proof doors. The long sides of the building will be lighted with forty-eight windows, eight on each floor on each side. The cabinets for holding the specimens will be arranged in blocks 8 feet high, of two tiers projecting like buttresses between the windows on the ground floor and galleries, thus accommodating the greatest number of cabinets with the least loss of space—a very import-

ant consideration considering the extent of the collection and the time that would be otherwise lost in consulting it. At the present time the number of cabinets is upwards of 600, and the estimated number of specimens contained in the whole is now considerably over 1,000,000, reckoning as one all the individuals of the same plant from the same locality.

The whole building will be heated with hot-water pipes. Water-mains charged at high pressure, sufficient to throw a jet more than the height of the whole building, will be carried to each floor. When complete the old building will be cleared out; as much as possible of its combustible fittings and woodwork removed, and the rooms arranged for the better accommodation of the library and of persons, besides the staff, engaged in the study of the collections.

Very extensive collections and contributions have been received at the herbarium (chiefly by gift) during the past year.

In accordance with the will of the late J. J. Bennett, F.R.S., Keeper of the Botanical Department of the British Museum, the Australian herbarium of his predecessor, Robert Brown, made during Flinders' survey of the coasts of Australia, is being divided between the British Museum (which retains the first set), the herbarium of the Royal Gardens, and that of the Edinburgh Botanic Garden. The first instalment of this valuable collection has been received, and comprises nearly 900 species.

The herbarium of the late Giles Munby has been presented by his daughters, and is of great extent and value, especially as regards the Algerian flora, of which he was, after Shaw and Desfontaines, the first efficient explorer. This herbarium is not only very extensive but is the authority for the only complete list of the Algerian flora which has hitherto been published, of which three editions in all have appeared (1847, 1859, 1866), comprising descriptions of various new species.

Very considerable and important accessions continue to be derived from the herbarium formed by Baron von Mueller in Victoria, which is transmitted to the Royal Gardens in furtherance of the *Flora Australiensis*, with the permission to retain duplicates. There is certainly no part of the world of equal extent and possessing as much of interest as Australia, which has, through the almost unaided exertions of one man, been so successfully explored botanically as has this by Baron von Mueller.

H.R.H. the Prince of Wales has graciously presented the herbarium formed by his botanical collector (Mr. Mudd) during his visit to India.

The botanical collections of the *Challenger* expedition made by Mr. Moseley have all been received at Kew, and have been for the most part arranged and distributed. Those received during the past year have been chiefly from Japan, the Society and Sandwich Islands, Juan Fernandez, Chili, and Patagonia.

EXPERIMENTS ON THE FLOW OF THE SAP.

I HOPE the lateness of these remarks may be excused, but as I did not see the *Gardeners' Chronicle* of July 21, until the beginning of August, I did not know the gist of Mr. Murray's paper until I saw it in the *Gardeners' Chronicle*. However, it is better late than never, as the saying goes, and now, with your permission, we will examine Mr. Murray's paper, and see how we shall be able to follow him in his experiments and in his reasoning thereon, and how far we shall be able to see into the correctness, or otherwise, of the theory which he propounds.

First, then, his experiments and his deductions therefrom. These are fully stated at p. 72 of the *Gardeners' Chronicle* for July, so that it is unnecessary to repeat them here.

In reading over his description of the experiment on the Grape Vine, the first thing that strikes us is that—according to Mr. Murray's own theory—the flow of sap upward was broken by the nick. The nutritive matter absorbed by the roots was cut off, and another fluid—Mr. Murray's Lithia and Litmus solution—substituted in its room. This Mr. Murray considers ascended, but did not descend as orthodoxy says it should, and from this Mr. Murray considers that he is justified in saying that there is really no descent of sap at all in most plants—at least in all plants similar to those operated on. Now we are at an utter loss to understand how he is justified in his conclusions. According to Saclì's theory of ascent,

and descent, what Mr. Murray describes as having taken place is exactly what we should expect.

Both theories agree in this, that the soil must furnish nutritive matter to the roots as food to the plant. The old theory is that mineral food alone is essential, and that the carbon is derived, at least chiefly, from the atmosphere. Mr. Murray says that all the food enters by the roots. According to either theory, but more especially according to that of Mr. Murray, the experiment was calculated to lead to error. The solutions used were not plant food, not even according to the theory which indicates that a few simple salts are sufficient for nutritive purposes, far less according to that advanced by Mr. Murray.

According to the received ideas of vegetable physiology, a plant which gets nothing but water will only live, and not grow—the roots will draw in the water, and the leaves will evaporate it; hence there can be no current save an upward one. Supposing that the theory which Mr. Murray attempts to upset is right—that there is an ascent and a descent of sap—according to that theory, a return of sap under the condition afforded by Mr. Murray is an utter impossibility, as there is nothing to return. According to the old theory, there was nothing in the solution supplied by Mr. Murray to combine with carbonic acid, &c., in the leaf to form descending sap. Before Mr. Murray is entitled to say that there is no such thing as descending sap he ought to supply a living plant with food, not merely water with litmus or litmus in it, before he can even lay claim to have made a fair and trustworthy experiment. His present experiment only proves that a plant is merely a capillary sponge when supplied with water only. Any experiments which we have read of, and any which we ourselves have made on this same subject and for the same purpose, were just the opposite of Mr. Murray's, the solution being nutrient, and the results were different, as one might expect. We may have more to say of these at another place.

Again, we are at loss to understand how his experiment proves the theory of endosmose and exosmose in error. He tries to make the most of the fact that his solution did not mingle with the whole body of the ascending sap. But here, again, this experiment proves nothing, which may not be reconciled with the old theory, and is even what was to be expected. Mr. Murray cut off the supply of sap which the roots were supplying to the leaves. This left empty vessels, the supply being tapped. What more natural, and what more in accordance with the old theory, could have happened than that these empty vessels should suck in the solution. The fact of its not having entered the opposite side seems to Mr. Murray to be against the endosmose and exosmose theory. But what else could have been expected? The opposite side was untrapped; the cells were full, and no endosmose action could be thought to be so powerful as to take the sap from vessels otherwise empty and further fill full ones.

Had Mr. Murray tapped the stem on the other side to prevent the flow of the sap, and supplied it (the cut) with pure water, and still no extravasation been apparent, then his experiment might have been of some value, but as it is it is not so. Again, had Mr. Murray cut a Vine in the same way as described, and had given no solution, but simply had left it open, and had the side thus cut died its extreme length, Mr. Murray might have denied the correctness of the theory of endosmose and exosmose. But this is what I and many more have done many a time, and not an inch of the wood has died in consequence, but, instead, the descending sap has closed the wound from above.

Again, further on, he tries to prove from his experiment and from reasoning that the old theory of plants taking in carbonic acid by the leaves, and its combining with the matters sent up by the roots to form the sap which builds up the tissues of the plant, is wrong, and to help his cause he makes some very strange and unwarranted statements. He says that plants do not take up food in the dark. This is an error. [We concur.] We have again and again grown plants in nothing save water and salts, and we have proved satisfactorily—to ourselves, at least—that plants take up solutions according to the temperature and aridity of the atmosphere. Again and again have we seen Hyacinths evaporate water during darkness. [Yes.] When the temperature was kept during darkness at the same figure, as during day we have found that the absorption was nearly equal, and Mr. Murray says that Hyacinths do not use water during darkness, and adds that such a statement is not disputed. We have more to say on this head

when speaking of carbonic acid. We may add that we have put coloured solutions in the water in which Hyacinths were growing after dusk, and when the temperature was kept high have found it in the utmost extremities next morning; but with a low temperature the result was as Mr. Murray indicates. Again, we have found that plants expel carbonic acid gas during darkness only with an unnaturally high temperature, but with a low temperature this action ceased, or only gave out the merest traces; while under bright sunshine and a high temperature the leaves of a small Vine deprived of air charged with four times the ordinary amount found in the atmosphere, as fast as we could pass it through a $\frac{1}{4}$ -inch tube, the escaping air showing no trace of the gas whatever. But this is an old and oft-repeated experiment. Mr. Murray will surely not deny the fact that plants will take up saline solutions, when these salts are the same as the mineral matter of the plants operated on are proved to be by chemical analysis. And if he is to hold the theory which he has advanced, that the carbon in some form is only taken in by the roots, he means that a saline solution, containing no carbon, is not plant food. With this solution, then, if this new theory is right, the plants will act just in the same way as they did with Mr. Murray's litmus and lithia solution; they will merely draw in the water, and by means of the leaves evaporate it, and leave the other things behind in the structure of the plant and in the leaves. As mineral salts alone do not form plant-tissue, this process carried on for a very short time would leave the plants thus fed saturated with salts, but more especially the leaves. This is the conclusion that we must come to if we are to accept Mr. Murray's theory. But every experimentalist knows that no such thing occurs. Mr. Murray damaged his own cause greatly when he uttered the sentence "that you may try to feed a plant with mineral matters alone but it will not grow." He ought to have known that such an experiment has been tried successfully again and again. But this stubborn fact is irreconcilable with Mr. Murray's theory, hence the ignoring of it. This fact forces us to the conclusion that the carbonic acid of the atmosphere is the chief source of carbon in plants, and that it is taken in and formed by the leaves into plant-food along with the other matters taken up by the roots.

Then in his illustration, to prove the correctness of his theory, it seems to us that the examples which he has chosen are just those which his theory cannot account for. He contends that Nature's way with tuberous plants is to build up those portions of the plants which are under ground and in darkness if a portion of the plant is exposed to the light. He is still reasoning on the strength of his former error that plants do not take up food during darkness, and holding to this he contends that if a portion of the plant is exposed to the light, that the tubers or portion of the plant which is in darkness acquires the same power to assimilate food as the exposed parts. Keeping in mind that the theory advanced is, that the roots draw in all the nourishment, we should certainly expect to find that the thickest part of the stem of the Potato plant, for instance, should be below where the tubers issue from it. But if Mr. Murray will put himself to the trouble, he will find that the thickest part of the stem is above where the tubers issue from the stem, and when Potatoes are manured with salts—not containing carbon—the production of tubers is generally increased.

All cultivators of plants must have noticed parts of plants, especially variegated ones, quite white and free from green. We may consider these as analogous to tubers. Well, we find that such portions grow so long as there is green leaves existing along with them, but that death invariably follows the removal of the green portion of the plant. We have fed such plants of *Cyperus alternifolius* with mineral salts alone, and have found the pure white stalks go on growing and being produced from the root as plentifully as those stalks which were green. Now these white stalks were just composed as the green ones were—chiefly carbon. If there is no such thing as return of sap and taking in of carbon by the leaves, how are we to account for the production of shoots being thrown up from the roots, which cannot assimilate food on their own account, but which die at once when deprived of the green portion of the plant, even although they are exposed to the light. Many instances might be cited quite similar to this, but space forbids.

Mr. Murray's pressing into the service of grafted trees to help him was surely clutching at straws. He tells us of the mighty influence of the stock over the

scion as proving an upward flow, and so disproving a downward flow of sap. The influence of stock over scion is very far from being the powerful force which he would have us believe. Take our old Rose *Senateur Vaisse*, and calculate how often bits of it, scarcely larger than a pin-head, have been taken and put on a strong Brier, and when these have pushed into shoots buds have again and again been taken off and inserted on strong Briers, and this has been going on for many generations of Roses, and yet we have a *Senateur Vaisse* with the selfsame characteristics possessed by it when first sent out; not one drop of Brier or *Manetti* blood apparent. This is the rule of all grafting whatever. Our *Jargonelle* Pears and our *Ribston Pippin* Apples have been grafted on stocks not of their own nature, and still have been handed down to us showing little trace of the Wilding, of the Quince, or of the Paradise in their constitution. Of all the "myriads of millions" of grafts spoken of by Mr. Murray, how many of them have shown a marked difference from their originals? Mr. Murray speaks of each graft being an experiment, proving that the stock has an altering influence on the scion. Yes, they are experiments these "myriads of millions" of grafted trees, but they prove how little the stock affects the scion; and more, they are all experiments one way. How many of these experiments have been conducted to determine the influence of scion over stock? Not one in a million; and, so far as I am aware, none at all; and the comparatively few instances which have occurred more by way of accident, showing that the scion alters the stock, are more numerous than can be produced out of "myriads of millions" of instances the other way. The very fact of grafting being a possibility proves the descent of sap, not by the whole body of the wood, like Mr. Murray's lithia and litmus solution, but between the wood and bark. Were there no descent of elaborated sap, propagating by means of grafts and cuttings would be an impossibility.

I had intended to have gone deeper into the subject, but our time and your space forbids; but I end by saying that, in my opinion, the experiments of Mr. Murray prove nothing, and were calculated to prove nothing. *Alexander Honeyman.*

THE GENUS AGAVE.

(Continued from p. 137.)

SERIES I.—CORIACEO-CARNOSÆ.—Texture of the leaf rigid, not at all fleshy nor yielding to the touch when mature; end-spine large, hard, and pungent.

Group IV. AMERICANÆ.—Edge of the leaf without any distinct horny border. Teeth large, deltoid-cuspidate, comparatively few in number.

In this paper I propose to deal with the large species of this group with oblanceolate leaves.

38. *A. (Euagave) Palmeri*, Engelm., Notes, p. 31.—Acaulescent. Leaves oblanceolate, 10–20 inches long, 2–2½ inches broad above the middle, slightly narrowed downwards; end-spine 1 inch or more long, deeply channelled and decurrent a couple of inches down the border; teeth unequal, deltoid-cuspidate, dark brown, $\frac{1}{2}$ – $\frac{3}{4}$ inch long, usually hooked. Scape 8–12 feet high. Panicle repeatedly and loosely branched; pedicels a line long. Perianth $1\frac{3}{4}$ –2 inches long, including the ovary, whitish; lobes and tube taken together as long as the ovary; lobes usually a little longer than the tube, the outer ones much thickened and hooded. Stamens inserted about the middle of the perianth-tube; filaments twice as long as the perianth-segments; anthers 8 lines long. Capsule cylindrical-trigonous, $1\frac{1}{2}$ –2 inches long; seeds under $\frac{1}{4}$ inch broad, with minute tubercles covering the whole surface.

Mountains of Southern Arizona, ascending to 6300 feet. Discovered by Dr. Schott in 1855. My account of the plant is taken entirely from Dr. Engelm., and it has not yet been introduced into cultivation.

39. *A. (Euagave) Theometel*, Zuccag.; Jacobi, Monogr., p. 70.—Acaulescent. Leaves about 30 in a dense rosette, oblanceolate-spathulate, $1\frac{1}{2}$ –2 feet long, $\frac{1}{2}$ – $\frac{3}{4}$ inches broad above the middle, narrowed to 3 inches above the dilated base, where it is 1 inch thick, the face nearly flat, green, slightly glaucous only when young, the dark brown pungent end-spine 1 inch long, the distant deltoid-cuspidate side prickles about $\frac{1}{4}$ inch long. Scape 10–12 feet high, including the thyrsoid panicle. Flowers yellowish-green, 3 inches long; perianth segments oblong. Filaments twice as long as the perianth-segments. Capsule oblong-trigonous.

A native of Mexico. Here my description of the leaves is taken from a plant in Mr. Peacock's collec-

tion, and of the inflorescence from Zuccagni. There is a figure in Roemer's *Collectanea* (tab. 3). The name, Theometel, goes back to Morison, and figures given by Munting and Ray are cited here by Kunth and others. The plant, as I understand it, differs mainly from the small forms of *americana* by its green not glaucous leaves, and may be only a variety of that species.

40. *A. coccinea*, Roezl; Jacobi, Monogr., p. 76.—Acaulescent. Leaves 20—30 in a dense rosette, oblanceolate-spathulate, 1½—2 feet long, 4—6 inches broad two-thirds of the way up, narrowed to 3 inches above the dilated base, where it is 1—1½ inch thick, the face

narrowed to 1½—2 inches above the dilated base, where it is 1 inch thick, the face a slightly glaucous green, the pungent brown black end-spine 1 inch long, the bright chestnut-brown prickles larger and more irregular than in *americana*, more hooked and furnished with longer and sharper cusps, reaching ½ inch long. Inflorescence unknown.

Described from a plant in the Reigate collection included in Mr. Saunders' set of photographs and a plant sent to Kew by Mr. Corderoy under the name given above. It comes in between *coccinea* and *americana*, differing from the small forms of the latter by its greener colour and larger unequal sharper

varieties of *americana*, from which it is scarcely distinct specifically. The inflorescence has not been figured, but it is described by Jacobi from a plant that flowered in 1855 at the botanic garden at Brussels. I refer here as forms, *A. cyanophylla*, Jacobi, Monogr., p. 228; and *A. Beaulauriana*, Jacobi, Nachtrage, ii., p. 25, fig. 36.

43. *A. (Euagave) americana*, Linn.; Andr. Bot. Rep., t. 433; Bot. Mag., t. 3654; Jacobi, Monogr., p. 63; Nachtrage, p. 24.—Acaulescent. Leaves usually 30—40, sometimes 50—60 in a rosette, oblanceolate-spathulate, 3—6 feet long, 6—9 inches broad above the middle, narrowed to 4—6 inches above the dilated base, where it

FIG. 36.—AGAVE MEXICANA VAR. CYANOPHYLLA.

nearly flat except towards the tip, dark green, only slightly glaucous when young, the centre ½ inch thick, the hard pungent end-spine 1½ inch long, the edge repand between the close irregular deltoid prickles, which are unequal in size, nearly straight, tipped with chestnut-brown, ½—¾ inch long. Inflorescence unknown.

A native of Mexico, introduced by Roezl in 1859. I have seen specimens at Kew, Reigate, and Hammer-smith, and there are two forms included in Mr. Saunders' set of photographs. It is marked by its bright green leaves and habit, and prickles halfway between *americana* and *Scolymus*.

41. *A. Maximiliana*, Hort. Saunders; *A. Gustaviana*, Hort. Corderoy.—Acaulescent. Leaves about twenty in a rosette, oblanceolate-spathulate, 1½—2 feet long, 2½—3 inches broad two-thirds of the way up,

chestnut-brown teeth. Probably a native of Mexico, but I have no knowledge as to its history, and cannot find it described in Jacobi's monograph or elsewhere.

42. *A. (Euagave) mexicana*, Lam.; Jacobi, Monogr., p. 99 and 304.—Acaulescent. Leaves 20—30 in a rosette, oblanceolate-spathulate, 1½—2 feet long, 3—4 inches broad two-thirds of the way up, narrowed to 2—2½ inches above the dilated base, where it is ¾—1 inch thick, the face nearly flat except towards the tip, very glaucous, the centre ½ inch thick, the brown pungent point about ½ inch long, the subsistent brown straight deltoid-cuspidate prickles ¼—½ inch long. Scape 18 feet high, including the thyrsoid panicle, which is 7—8 feet long. Perianth greenish yellow, 2½ inch long; tube 8 lines; segments under 1 inch long. Filaments much exserted, 2—2½ inches long; anthers 1 inch long.

A native of Mexico. Closely allied to the small

is 2—4 inches thick, glaucous green, more or less concave all down the face, the outer leaves recurved, the hard dark brown pungent point 1½—2 inches long, the edge repand between the distant unequal spreading nearly straight brown-tipped deltoid-cuspidate prickles, which are ¼—½ inch long. Scape, including the thyrsoid panicle, reaching a height of 24—36 feet; branches 20—40, some nearly 1 foot long; flowers in very dense globose clusters, on pedicels ¼—½ inch long. Perianth yellowish green, reaching a length of 2—3½ inches; ovary clavate-trigonal, rather shorter than the segments and tube taken together; tube funnel-shaped, about ½ inch long; segments 9—15 lines long. Filaments inserted at the throat of the tube, twice as long as the segments; anthers ¾—1 inch long. Capsule oblong.

Widely spread in tropical America, and now grown universally through the tropical and warm temperate

zones of the Old World. It is said to have been introduced into Europe about the middle of the sixteenth century, and to have first flowered at Hampton Court in 1714. I place here as forms *A. Milleri*, Haworth, Jacobi, Monogr., p. 65 (*A. virginica*, Miller, non Linn.—dwarfer than the type); *A. picta*, Salm-Dyck; Jacobi, Monogr., p. 67; and *A. ornata*, Jacobi, Monogr., p. 69 (simply forms with variegated leaves); *A. Fuerstenbergii*, Jacobi, Nachtrage, ii., p. 72; and *A. expansa*, Jacobi, Nachtrage, ii., p. 26, but have not seen authenticated specimens of the two latter. This concludes the American group. *J. G. Baker.*

REMARKS ON THE FRUIT CROPS, 1877.

The following is the concluding portion of the supplementary reports, obligingly sent to us by our correspondents with the tabular statements published in our last issue. Following the plan adopted in our last number, at p. 172, the counties are arranged in the order of their importance as fruit-producing centres, as shown by the Agricultural Returns for 1876, published by the Statistical and Commercial Department of the Board of Trade, which under the head of "Orchards, &c.," gives the acreage of arable or grass lands, used also for fruit trees of any kind. Thus the three Ridings of Yorkshire contained 2581 acres; Lancashire, 1781; Sussex, 1652; Bucks, 1575; Norfolk, 1440; Nottingham, 1359; Berks, 1345; Cheshire, 1219; Cambridge, 1189; Hants, 1161; Lincoln, 1157; Essex, 1057; Hertford, 1033; Suffolk, 985; Warwick, 899; Stafford, 822; Oxford, 788; Derby, 629; Leicester, 603; Nottingham, 499; Bedford, 372; Cumberland, 262; Hunts, 252; Westmoreland, 181; Northumberland, 153; and Rutland, 53.

York.—The fruit crops in this neighbourhood are in general light. Of some kinds of Apples there are fair crops, whilst of others there is none here. Some trees of Cockpit have a good crop, also the Improved Cockpit, King Apple, Yellow Ingestrie, and some others. *M. Saul, Stourton.*

—This is with us a bad fruit season, far worse than we have ever before had during the fourteen years I have been here. This in a great measure is due to the unusually severe weather of spring, and also, I think, to the wet and cold autumn of last year. Excepting Currants, Strawberries, Gooseberries, and Raspberries, Pears were the only fruit of which we had an abundant bloom. *John Young, Wentworth.*

—The fruit crops are the worst I have known the past five years in this locality. Stone fruits especially are almost a complete failure. We have some 60 yards of south wall covered with Moor Park Apricot, and not a single fruit. Wall Plums on various aspects and on standards are as bad. Apples are fair in some parts; a local variety called Cockpit is the best. Marie Louise and Louise Bonne, of Jersey, Pears which usually bear good crops, are a complete failure. I am of opinion that the principal cause of the scarcity of fruit was the wet, sunless autumn last year, and the consequent non-ripening of the wood. We had plenty of bloom, but it was weak and imperfect. *H. F. Clayton, Grimston Park.*

—On Apples, Pears, and Plums, there was less bloom this season than I have noticed for years. Out of about fifty Apple and Pear trees on the Quince and Paradise stocks, and which flowered better than the orchard and other trees in the garden, there are only three trees with any crops on them, and these are Sturmer, Cockle, and Golden Pippins. *J. Simpson, Wortley Hall Gardens, Sheffield.*

—The sharp frost in May destroyed the bloom of all stone fruit. Pears and Apples very variable; in sheltered dry situations there are some nice orchards of fruit, in others scarcely any. *Robert C., Kingston, Brantinghamthorpe.*

Leicester.—We had an abundance of bloom upon all kinds of fruit trees. Apricots set thickly with us but thinned themselves considerably at the time of stoning, notwithstanding the trees had been eased of part of their crop previously. Pears made a fine show at blooming time, but the blossoms fell without setting, and many of the trees have bloomed freely a second time and are now making far too much wood; the result no doubt of hot weather, a heavy rain fall, and having no crop to carry. Cherries cracked a good deal during the recent heavy rains, and Strawberries were damaged to some extent. *F. H., Knowsley.*

Sussex.—A wet cold spring, low night temperatures,

and high winds, all sadly injured the blossom, consequently choice fruit is scarce. *J. Rind, Bridge Castle.*

Bucks.—At the commencement of May the condition of hardy fruit trees here gave every promise and prospect of a most fruitful year; a few days afterwards these preconceived notions were, however, entirely dissipated by the advent of a frost of unusual severity, which blackened and killed outright nearly all the Cherries and Plums and great numbers of the Pears also. The Peaches, Nectarines, and Apricots, which hitherto had withstood tolerably well the influence of an inclement season, now to a great extent succumbed to the same fate, leaving but few, and these of only a poor description; the trees likewise in many places, here amongst others, have also been much weakened through blistered leaves and growth as in some instances to cause much concern as to their ultimate recovery. *G. T. Miles, Wycombe Abbey.*

—Early in the season we had every prospect of a good fruit crop in this district; the trees for miles were one mass of blossom, but the cold winds and frosty nights cut it all up before there were any leaves on the trees to shelter the flowers. This is the worst fruit season in this part that has been known for years. *J. Smith, Mentmore.*

Norfolk.—I cannot help feeling wretched this season about our fruit crops. After thirty-four years' experience this has been by far the worst I ever saw. Having had a very mild winter and tolerable April, though not much sun, then to get a May the scourge of all fruit trees in this district, Peaches and Nectarines only now recovering the blast of those north-easterly winds, far worse than any still frost I ever saw. Pears, Plums, Peaches, Nectarines, Gooseberries, all had to succumb; Apricots all gone three weeks before; and now our only fruit has been and is—Strawberries a fair crop, Raspberries and Currants good, Apples a very fair crop throughout. Our vegetable crops are all promising, Potatoes looking admirable, showing no disease yet. All corn crops in this neighbourhood looking well, root crops poor to what they should be. This I attribute to the unkindly state of the soil through a late, wet, cold spring. *Charles Penny, The Gardens, Sandringham.*

—The fruit crops in this district are, without exception, the worst that has been for many, many years. *William Bishop, The Gardens, Eylangh Park.*

—Wall fruit of all kinds in this quarter of Norfolk is a failure; in fact, more so than the bad crops of last season. Protected and unprotected trees suffered nearly alike. I need hardly observe that all kinds of fruit trees promised well, but their blossoms suffered through ungenial weather, especially lack of sunshine. *John Wighton, Cossey Park.*

Notts.—I have not experienced before in this district such a general failure in the crops of Apples, Pears, Plums, and Cherries as has taken place this year. The trees showed abundance of blossoms, but the frosty nights and mornings and cold north-east winds in April and May injured the setting of the fruit. The Apples flowered much later than usual, and could not have felt the effects of the keen frosts in the beginning of May so much as to injure the blossoms, but they seemed paler in colour, and the young fruit dropped after being set. This shows that the abnormal mild and wet weather in January and February, and the unripened condition of the wood in the autumn, were the causes of the failures in the hardy fruit crops this year. The crops of Peaches, Nectarines, and Apricots are thin on the open walls here, but abundant under the protection of glass. Small fruits, such as Gooseberries, Currants, and Raspberries, are an average crop, but the fruit is smaller than usual. Strawberries, an abundant crop of the leading sorts, but not so well flavoured as in some years. *J. Tillery, Welbeck.*

—We never before had such a quantity of bloom as we had this season. The Apples of which we shall have a few are: Court of Wick, Claygate Pearmain, Wellington, Atkiss No. 2 (a grand Apple), Cellini, Golden Nobbs, and Winter Pearmain. Pears: Matthews' Eliza, Bonne d'Ézée, Emile de Heyst, Angélique à Bordeaux, Beurré d'Areberg, B. Diel, Catinka, small, but has never missed a crop the last ten years. *A. Henderson, Thoresby Park.*

Berks.—I cannot attribute the cause of failure in the stone fruit crop to frost alone—such as Apricots, Plums, and Peaches, set their fruit well, and did not begin to drop till they were the size of Horsebeans. The cause was probably due to the continuation of cold, shady, weather, after the fruit was set. The

following are the kinds of Apples that are bearing heavy crops of fruit this season—Rosemary Russet, Frogmore Prolific, Bleheim, Pomona, King of the Pippins, Hawthornden, and Flower of Herts. Among Strawberries, perhaps, the best here were La Grosse Sucré, Mr. Radcliffe, Aromatic, James Veitch, Sir J. Paxton, Fairy Queen, John Powell, and Frogmore Late Pine. *T. Jones, Royal Gardens, Frogmore.*

—The fruit crops in this neighbourhood are very light indeed, although as far as bloom was concerned the trees never promised better, but the late frosts and cold east winds caused a complete failure of Peaches, Nectarines, Apricots, and Plums; the two former have been very much blistered, but most of them are growing out of it now. Pears are not a tenth of a crop, and what there is do not look promising. Some sorts of Apples, viz., Northern Greening, Keswick Codlin, Eclinville Seedling, Cox's Orange Pippin, and Broad-eyed Pippin are a full average. Blenheim Orange, Datch Codlin, Alfriston, and a few others are nearly an average, but many sorts have little or no fruit on them at all. May Duke and Elton Cherries were a good average, early sorts very scarce, and Morellos hardly half a crop. *Charles Ross, Wel-ford Park.*

Cheshire.—With the exception of Currants, Raspberries, Gooseberries, and Strawberries, this is an exceptionally poor fruit year. The Apples, from what I have seen, are the best of tree fruits, and it is exceptional to find one with a good crop. Cellini Pippin, Hawthornden, and Lord Suffield are amongst the best. Victoria is the best Plum. *R. Mackellar, Abney Hall, Cheddle.*

—With the exception of small fruits, this is probably the worst fruit year we have had for six or seven years. *Thomas Selwood, Eaton Hall Gardens, Chester.*

—Apricots on walls protected when the trees were in bloom are an average crop. Peaches and Nectarines the same, but, in common with all fruit trees, Roses, &c., the young foliage was unfavourably affected by the cold winds and frosts, which continued through a great part of April and May. Plums, Pears, and Damsons suffered most, and are very scarce in this district. Some kinds of Apples (as Irish Peach, Keswick, Hawthornden, Lord Suffield, Ribston Pippin, and a few others) are bearing full crops; others, none, or very little. *William Whitaker, Crewe Hall.*

Hants.—Apples are much better than at one time was expected. Lord Suffield, Keswick Codlin, Deux Aux, Goldee Noble, and Hawthornden are bearing most freely. As regards fruit crops generally, the present is the worst for many years past, and seems all the more disastrous by reason of the abundant blossom, and consequent high hopes of a good fruit year—all, however, to be blighted ere the treacherous month of May had half run through. Peaches and Nectarines are here quite a failure, though well protected; I therefore attribute their failure to imperfect ripening of wood, through the autumn being so wet and sunless. Pears on walls are excellent, but on pyramids and bushes there are none whatever, so that here is another practical lesson in fruit culture. *W. Wildsmith, Heckfield Place.*

—The fruit crops in this neighbourhood are not very cheering, but I do not think it is altogether owing to bad weather, the blossoms never having that stiff robust appearance about them one sees in the Midland Counties. Plums are very scarce indeed. Trees were covered with nice plump bloom buds, but the birds destroyed nearly all. I never saw them make such havoc amongst fruit trees before. Filberts and Cob Nuts are a wonderful crop. *James Taverner, Woolmer Forest.*

Lincoln.—The fruit crop of 1877 is the poorest I have ever experienced. We had a mild open winter, and at the end of February vegetation was in a very forward state. From that date we had cold east winds with frosty nights, which checked vegetation very much, and during the last week of April and first nine days of May we had sharp frost with cold east winds, which completely scorched, as it were, the bloom and young foliage of Apricots, Pears, Plums, and Cherries, and although protected with Frigi Domn, did not save either fruit or young shoots. The trees about the end of May appeared as if they were killed, but have since recovered, and are now making good growth. Apples, although late in blooming, produced an abundant show of bloom, hopes were, therefore, entertained of an abundant crop; but they also failed, not from frost, but from the cold cutting

east wind, and the wood not having been properly ripened the previous year. *David Lumsden, Bloxholm.*

—The spring of 1877 will long be remembered by horticulturists. There was ample bloom of all kinds, but the extraordinary frosts in May destroyed the bloom, which has caused Apricots, Peaches, Plums, Pears, &c., to be almost a failure. *Wm. Hurst, Sowerby Park, Gainsborough.*

—We had an abundant show of Apricots, Plums, and Pears up to March 22; the thermometer that night fell to 17°, which for the most part cut off the above. Apples also suffered severely. *Isaac Dell, Stoke Rochford.*

Essex.—Save in regard to small fruits, I have very little to report favourably, Raspberries being a fine crop amongst them. Of Figs, both the old black and Lee's Perpetual are a good crop—the latter especially, though growing in distended tree-form, being a very heavy crop. Blenheim Orange and Five-crown Pippin Apples of the later crops, and Hawthornden, are the only kinds which have a sprinkling of fruit upon them at this place. Wall fruit crops were lost in many instances owing to the long cold period we experienced, even after they were set, rather than to any severe frosts experienced. *William Early, Valence.*

Herts.—Until the severe frosts in the early part of May never could there be a better promise of abundant crops of fruit, Peaches and Apricots being the exception. The wet unfavourable autumn, combined with the sunless spring, was most disastrous to the trees, hence an almost total failure of a crop of fruit. Since the dry warm weather in June the trees have recovered rapidly, and are now making good growth. *Richard Raffett, Panshanger.*

Suffolk.—Except Figs, all the choicer fruits are an almost entire failure. Plums, of which there was a fine crop set, were swept clean off by the May frost, and quite stewed the ground. Apricots, Peaches, and Nectarines, were destroyed in like manner, and not only was this the case with the fruit, but many trees were crippled to a serious extent, and in some places so much so as to be unable to recover. Some kinds of Pears have set fairly on west walls, but the fruit shows the effect of frost in the irregular way it is swelling, and is therefore likely to be of inferior quality and small. Pyramids, except in very sheltered places, are a failure. Dessert Cherries on walls have been good, but a thin crop, as are likewise Morellos. *J. Sheppard, Wolverstone Park.*

—This is the worst year that I remember for outdoor fruit. Apricots, Peaches, and Plums, are quite a failure. Protecting the blossoms by whatever means (without glass) seemed to be quite ineffectual to secure a crop. Small fruit of all kinds have been abundant and good. Strawberries and Raspberries I have never seen finer. *T. Blair, Shrubland Park.*

—Apricots, Pears, Plums, Peaches, are so few and so late that it is needless to describe their quality. The trees are, however, fast recovering from their cold snap in May, and are making fair wood for next year. Apples are dropping a good deal, though the fruit remaining looks clean and healthy. Gooseberries and Currants, red, white, and black, in these gardens, are a full crop. Out-of-door Figs a full crop of full size; Walnuts a partial crop. *D. T. Fish.*

Warwick.—This has been another disastrous year amongst the out-of-door fruits of this country. With our uncertainty of climate the wonder is, not that we should ever have a good year, or even a sprinkling, but that we should ever have any outdoor fruit at all, seeing that we are so frequently visited by severe frosts just at those times when our Pear and Apple blossom requires an atmosphere free of frost. The cold wave of this year appears to have carried general destruction of blossom before it, irrespective of any protection we might expect to have from any favoured local or geological formation, and artificial wall coverings appear to have been of but little use. Otherwise the year is a good one, and well calculated to mature fruits had only a "set" been secured. *W. Miller, Combe Abbey.*

—The Apple crop in this district is below the average, and, in fact, in many orchards the crop is nil. Here, however, taken collectively, there is a fair crop, and in a few instances the crop is prodigious, notably on trees of Kentish Fillbasket, old Hawthornden, and Keswick Codlin, the two former being the most remarkable I ever witnessed. Of Ribston Pippin and other early blooming varieties there are but few, owing to the frosts whilst in bloom. Of Pears on the walls there is a fair crop of such as Beurré Rance, Winter Nellis, Ne Plus Meuris, and Beurré de

Capiaumont. Plums are a total failure, Apricots very few; the same remark applies to other stone fruits. Gooseberries scanty, excepting that useful and prolific sort the Green Gage. Currants, black, red, and white, good crops and fine quality. I may add that upon the whole our fruit trees are enjoying an immunity from insects and other blights, coupled with vigorous growth, which augurs well for next year's fruition. *Wm. Gardiner, Eaton Park.*

Stafford.—This is without doubt one of the very worst seasons I have ever known in this district for Apples, Pears, Apricots, and Plums. Of Apples the following are bearing the best crops:—Warwick Codlin, Mank's Codlin, Lord Suffield, Hawthornden, Blenheim Orange, Ribston Pippin. Of Pears:—Glou Morceau, Beurré Rance, Ne Plus Meuris, Winter Nellis (on a wall), and Bishop's Thumb. The show of healthy blossom on all fruit trees was abundant, and without doubt good crops would have followed had it not been for the very unfavourable weather which prevailed during the spring. On May 4, 5, and 6 we had 13°, 15° and 12° respectively, which of itself destroyed most of the Pear, Plum, and Damson blossom. We had not much frost while the Apple trees were in blossom, but very high cold winds prevailed during the whole of the time, which had the effect of blowing off the blossom before it had time to set. *O. Thomas, Drayton Manor.*

—The fruit crop of 1877 is remarkable for its scarcity, at least in this district; the cause probably may partly be traced to the excessive wet autumn. Our average rainfall for the last thirty-three years equals 24.33; last year we had 32.94; in September we registered 4.51 which is about double our average for that month. Apricots are a total failure except under glass. Apples are a very poor crop, many trees being quite barren. Pears are almost a failure except Jargonelles, Bergamotte d'Espereen and Comte de Lamy. Plums are very bad. *E. Simpson, Wrottesley.*

Oxford.—The fruit crops in this neighbourhood are very partial. Apricots a total failure. Other stone fruits and Pears a trifle better, but much under average. Apples in orchards average a good half crop, with here and there a few trees loaded. Stirling Castle, Atkins' No. 2, Tower of Glamis, Cellini, and King of the Pippins, grown as pyramids, have cropped well. Trees of all kinds bloomed profusely, but failed to set properly, owing to immature wood and bad weather. *W. Crump, Blenheim Palace Gardens.*

Derby.—The wall trees up to the month of May looked very promising. Peaches showed an excellent quantity of flower, which set well, but the three successive nights of frost, 10° each night, followed by bright sunshine, caused them nearly all to drop off. Pears also promised well up to the same time. Standards got completely cut off, but the trees on walls, sheltered from east wind, show a very fine lot of good fruit. Apples showed an excellent quantity of flower, but, as already noted by Mr. Fish, it was very pale in colour, and with very few exceptions the trees are fruitless. Black and Red Currants are excellent. Raspberries are very fine, and good quality. Strawberries very fine crops, British Queen and Kean's Seedling suiting our soil the best. Figs on open walls show a heavy crop, which were unprotected in the winter time. *J. W. Bayne, Kingston Hall.*

—The present almost sunless spring and long continuance of cold east wind, with severe frost almost nightly during April and May, has been most disastrous to our fruit crops. Trees have also suffered very much. Peaches and Nectarines are sadly blistered and mildewed, and what little fruit we have left continued to shrivel and drop. Apricots are almost a failure, although the trees have been well-protected with hay mats. Plums are a thin crop on west walls, but quite a failure on east walls and standards. There are a few Pears on west walls, but quite a failure on east walls, bushes, and standards. Apples are a thin crop, and small. *J. H. Goodacre, Elvaston Castle.*

Leicester.—Stimulated by warm, moist weather in February and part of March, and an earth temperature that ranged from 41° to 43°, fruit trees began to expand their flower-buds at an unusually early period in the year. A cold, ungenial April and May checked vegetative action, and Apricot, Pear, and Plum blossom fell from the trees less from any actual frost than prolonged cold and chilling north-east winds, the blighting effect of which was never more apparent. It has proved the worst year for Apricots I ever

knew, and very few Peaches were saved under glass copings. Poir Pêche, Bergamotte d'Espereen, amongst Pears, have shown in good crops constitutional power to bear cold. Apples bloomed abundantly, and partial crops on Frogmore Prolific. Herefordshire Pearmain, Northern Greening, Bess Pool, give useful hints as to the hardy nature of these kinds. Nut trees produced innumerable catkins, and large crops have followed. Walnuts are abundant. *W. Ingram, Belvoir Castle.*

—We never had a greater amount of blossom on fruit trees than this year, but the late spring frosts destroyed the greater part of it. Although the flowers did not fall at the time, I noticed that the points of the pistils were nearly all turned brown; consequently the fruit never set. With regard to stating some of the crop under average, does not give much idea of facts, as in some cases, such as Apricots and Plums, there are really none, and the same may be said of Cherries, with the exception of May Duke and Morellos. Pears very few indeed; Peaches and Nectarines more than half a crop; Gooseberries half a crop, all other small fruits abundant and good. *M. Henderson, Coleorton Hall.*

Northampton.—All small fruits are very good except Gooseberries; other fruits are very scarce indeed. Apricots, Plums, and Raspberries were destroyed by bullfinches taking nearly every fruit-bud. Pear and Peach bloom was cut off by the severe frost on May 5 and 6, when the glass registered 8° of frost. Apples were loaded with bloom, but very badly set. Filberts and Walnuts we have a very heavy crop; in the woods the Hazel is quite loaded. *J. Smith, Althorp Gardens.*

Beds.—Up to May 3 our fruit prospects were never better, Pears, Plums, Cherries, &c., showing masses of bloom. On the 4th and following morning we had 10° of frost, which destroyed all early Cherries, Plums, Peaches, and Nectarines, and leaving only a scattered crop of Pears. Apricots, which looked weak from the first, also fell off. Apples and Morello Cherries we have an average crop, which promises to be good. Gooseberries and Currants plenty. Black Currants being fine in quality. Strawberries looked weak at the blooming period, but ripened off a good crop. *A. McKay, Woburn Abbey.*

Cumberland.—The fruit crops in this neighbourhood are nearly a total failure, excepting small fruits, which are good and plentiful. There is a sprinkling of Apples on some sorts, such as Keswick and Carlisle Codlins, Stirling Castle, and one or two more. We attribute the failure to the cold, backward, bleak, and unseasonable spring weather we had at the blossoming season. *John Taylor, Isel Grange.*

Westmoreland.—The Apricots, Plums, and Pears, which are almost a failure, was very promising early in spring, but the long continuance of bitter easterly winds, and lack of moisture during the blossoming season, I think was more the cause of failure here than any want of ripening of the wood during last autumn. *William Shand, Lowther.*

Durham.—Pears had little blossom, and dropped off after setting. Apples the same. In fact, we have little in this locality. The old Hawthornden has a fine crop, but all through the month of May and June we had cold winds from the sea which scorched a deal of the foliage of Pears, Apples, Raspberries. Gooseberries scarce in exposed places. *Robert Draper Seaham.*

Northumberland.—The fruit crops in this district are very light, much below the average. The bloom on fruit trees of all kinds was very abundant, and gave every appearance of good crops; but the long continuance of wet weather, and little sun, prevented the blooms from setting. I never remember seeing the bloom hang so long on the Peach-trees out-doors as it did this year. Some sorts of Peaches and Nectarines are much better with me this year than others, viz., Prince of Wales, Barrington, and Noblesse Peaches; Pine-apple, Hardwicke Seedling, and Hunt's Tawny, Nectarines have all a fair crop, while other sorts on the same walls have next to none. *A. Ingram, Alnwick Castle.*

Rutland.—Around this neighbourhood fruit crops are on the whole very unsatisfactory, although the prospects early in the season were very promising. All kinds of fruit trees bloomed abundantly. Plums, Peaches, and Nectarines, are a failure. Apricots, where well protected, fair crop. Cherries, with exception of Morellos, are a failure. Apples very scarce. The cold east winds which prevailed here during the greater part of April and May, accompanied with hail-storms and frost, destroyed our crops here. *F. Clarke, Barleythorpe.*

Apiary.

PERHAPS the following facts may interest some of your Apian readers, as they have been of some interest to me. It has always been understood that only one queen reigned in a colony, and, indeed, from my own observations, I always received this as orthodox. However, this season I have been a little shaken in regard to this, from facts I will here relate. I had a colony which sent off a swarm about June 10, which I hived all right; the bees, however, all went back to the old colony within half an hour. I concluded from this that the queen had either been lost or never came away with the bees, and I found, from after events, that the former conclusion was the correct one, for when the ordinary time had elapsed the piping of the young queens confirmed it, and in a day or so the swarm came off all right with better success this time, as all went well. Still the piping went on in the old colony, and next day I got another swarm, which I united with another. Still the piping went on in the old one, and, as I did not want any more swarms from it, I proceeded to try if I could put a stop to this piping, thinking I had nothing to do but turn up the hive and destroy the young queens in the cells, as I had often done before. I found them with a small part of the cell eaten, and calling and eating vigorously time about—at least this is what they seemed to me to be doing.

After removing the small super I had put on to try and prevent swarms, I was astonished to find, running about along with some bees on the crown of the hive, three healthy queens. I picked them up and brought two of them into the house, and put them under a tumbler—this was about 8 o'clock at night. I went back to the hive to continue my investigations, when I found other two queens, which I picked up also; but, when I brought them in, I was rather taken aback to find one of the previous queens I had put under the tumbler lying dead. I at once removed it, and put in another, and sat down to watch the result. It was not long before the two queens met, and in a shorter time still one of them lay dead, for the one killed the other without any ceremony. Now here was a case where there were at least five queens reigning at once in the same colony. How was it they did not kill each other when in the hive, for they undoubtedly must have met where I found them. Has any of your apian readers had any experience of this kind? *W. K.*

P.S. Two days elapsed between the last swarm and the finding of the queens.

A NOVEL AND SIMPLE HONEY EXTRACTOR.—The simple honey extractor which we figure in the next column (fig. 37) is the best and most efficient for its professed purposes that we have ever known. The large and cumbersome wooden machine, first introduced from Germany several years ago, is too expensive for the large class of cottage beekeepers in this country; but the one we now bring before the notice of our readers, can easily be made by any tin-worker, and will not cost more than a few shillings.

The extractor is made of tin; it is merely an inverted cone, open at the base or neck, which when in use is kept closed by a cork; the handle is made of iron, with a rounded bend at the upper part. Closely fitting on the cone is the box, fig. 38, prepared for the comb; we fasten this on the extractor by means of a long piece of wire, so that the lid, and afterwards the box itself, is securely fastened on the machine. The lower part of the box on which the comb rests is made of stout wires soldered on the tin edge, about $\frac{1}{2}$ inch apart, to allow the honey to run through into the lower portion. This should be loose, so that it can be cleaned.

Any expert tinman can from our description and figures make it, but when the order is given, we must impress upon our friends that they should be careful to have the size of the box correct; this would be done by having it made to the size of the bars used in the apiary, allowing of course for the extra thickness of the comb. As an act of justice, we must inform our readers that the original of this extractor is an Italian machine, called "*smielatore*," and was introduced to England by Captain Daoyell, in the pages of the *Field*; we have made several slight improvements, chiefly to fasten on the box securely.

HOW TO USE THE EXTRACTOR.—We need scarcely say the extractor is intended only for use with the bar

frames, such as are found in the Woodbury hives. Before placing the comb in the box, cut off the caps over the cells with a sharp knife, and place it on the cut side on the wire grating; then fix the machine in the ring of the handle of a long house-brush, or anything similar; now it only remains to turn the machine rapidly, and the whole of the honey on the one side of the comb will run out into the

FIG. 37.—HONEY EXTRACTOR, CLOSED.

lower part of the machine; afterwards turn the comb and repeat the process. It is well to fix or to solder a piece of fine copper wire netting, about 4 inches above the neck; this will act like a sieve, and cause the honey to run from the extractor perfectly clean, and free from comb and other impurities.

FIG. 38.—HONEY EXTRACTOR: THE UPPER PART OPENED.

A capital—in fact, we have found the best—plan of using the extractor, is to place a large staple in any blank wall, and, if another be fastened on the end of the broom-handle, the machine can be worked far better and with a single hand by the apian; but it

FIG. 39.—HONEY EXTRACTOR: THE PART ON WHICH THE COMB RESTS.

will be necessary for some friend to help by holding one end of the handle and working in unison, if it is employed without the iron staple.

We would advise the bee-keeper to practise the swinging of the machine before placing the comb in

FIG. 40.—HONEY EXTRACTOR: SHOWING THE COMB FITTED INTO THE RECEPTACLE.

the box; he will thus have more confidence, and probably avoid breaking the comb.

Carefully wash every part of the extractor before putting it away after using it. This caution is the more needful if we recollect that the bees will soon find out or detect it by the flavour of the honey. It is by this means easy to make them into household pests instead of household pets.

On this occasion we have not space sufficient to tell of the advantages and gains arising from the wise use of this simple machine. Years ago we were wishing to meet with some cheap extractor, and one like the Italian, that we could honestly advise all our friends to purchase. We must not overlook the startling fact that the bees must first gather 20 lb. of honey before they can make 1 lb. of wax; or, put it in another light, they must collect almost 20 lb. of pure honey before they can build up a small cottage skep with combs. Now, if we can devise some method to save all the old combs; and, after taking out the honey, give it back to the hive to again fill with honey, look what an immense saving is effected. For example, use, as we have lately done, a small-sized Woodbury hive in the height of the honey season, especially if the honey dew be plentiful, or we have large broad acres of the Dutch Clover within a fair distance. We can take out the bar-frame at each end of the hive about every third or fourth day, and pass them through the extractor; each time we have an average of 4 lb. of pure honey, which will realise 6s. We have hives yielding us 12s. weekly from four to five weeks in good average honey years. Is not this a more sensible plan than the one commonly adopted by nearly every cottage bee-keeper, simply because their fathers pursued the same way of working the apiary; that is, let them work the year through, and then cruelly murder the whole colony for the sake of about 12 lb. of sulphur-tainted honey. *K.*

AMATEUR GARDENING.

FLOWERS.—Looking at plant life in all but its lowest forms it will be found that the great point—the climax to which all its operations tend—is the flower, and the consequent seed.

Artificially or accidentally, from broken bits, or more or less by various modifications of its own ways of growth, the parent plant may be propagated, but reproduction from seed is the chief natural method of keeping up the race, and the various forms and colours and scents which we prize in our favourite flowers have their especial use in guarding the stamens and the pistil with its embryo seeds from injury, in drawing food to nourish them or in attracting insects necessary for proper fertilisation.

The flower itself (unlikely as it may seem at first sight), is really a shortened branch; an axis bearing altered leaves. This may be seen in the Rose, where the blossom is occasionally altered into a leafy shoot growing from the centre of the coloured petals, and in the variety known as the Green Rose (figs. 42, 43) where every part of the blossom, sepals and petals, stamens and pistils, may be found transformed into more or less perfectly developed green leaves. This may be seen also in Clover, double Cherry, and other instances, and the flower being in fact leafage in an altered state will be found often to accompany an altered state of ordinary plant secretions.

The vigorous circulation produced by rich manure and plentiful moisture accompanied by raised temperature gives long shoots, strong leafage, great luxuriance generally, but frequently no flowers.

For these the sap is needed in a more condensed state, less water and more of the material that it holds, and its course must be retarded and the quantity accumulated to bring the dormant flower-buds into action. We see this in the "well-ripened" wood of the Vine or Peach requisite for good bearing, in the Hyacinth flowering on the stores of preceding years, and generally in the fact of plants flowering, not on long, sappy shoots—"thieves," as they are called—but on the more matured growths, whether (as in annuals) of the present season or of the previous one.

HOW TO MAKE PLANTS FLOWER.

If we turn a plant which has been flowering freely out of its pot we shall probably find its roots wound in a great mat round the outside of the ball (fig. 44). This is one way of checking circulation. The plant must first be healthily grown, and then, if flowering does not occur naturally, the development of leafage being checked by the cramping of the roots, the consequent retarded circulation of the more condensed sap throws the flower-buds, which otherwise might have remained dormant, into action.

We should not on any account pull off the leaves, for we do not want less food, but to have it in a more condensed form, and the natural agents are sunshine, warm dry air, and dry ground. Artificially we may throw plants into flower by withholding

water partially or entirely, by root pruning, or taking up the plant and resetting it, and by cutting off the

"Succulent that feeds its giant strength,
But barren, at the expense of neighbouring twigs,"

so that sunlight may be admitted to ripen the wood. We may pinch off the tops of shoots to stop the flow of sap to the extremity, or we may accumulate it by bending down the boughs, or by ringing or tying a ligature round some particular branch which it is wished to throw into blossom.

We may (as in the case of the *Wistaria*) hasten the season of maturity when flowers can be produced by good feeding, but when this stage is gained the amateur should remember that over manure, with moisture in earth and air accompanying warmth, are stimulants to such vigorous growth as produces leaves rather than flowers, and a good lesson may be taken from the different amount of flowers commonly borne by the same species of plant on the sunny or the shady side of a hedge.

When the flowers are formed we fall again into the common routine. If we take a petal we shall find that as in the leaf there is a thin outer skin with a layer of cells between each side of the leaf, and the flower, like the leaf, being constantly evaporating moisture, like it, requires nourishment, and even more care, for it has but a short life. The flowers want plenty of food to nourish the embryo seeds they guard, and, therefore, must be well but not over-fed. Ordinary liquid manure, or liquid plant stimulants, or moisture that will make the supplies round available, are therefore useful more or less during flowering, and a damp quiet air. Draughts and dry air both do injury by causing excess of evaporation.

Any great quantity of gross food, however, or over-

FIG. 41.—UNRESTRICTED ROOTS.

stimulation of the plant system, should generally be avoided. Some plants bear it, but with some, as with *Carnations*, the colouring is likely to be injured, or a distortion of the flower may ensue. The stamens may change into petals, petals into leaves, or the flower may become altogether double if the soil is too rich, but though we owe many of our prized double varieties of florists' flowers to careful stimulus, and curious changes may be brought about in the blossom by its judicious application, generally speaking the result of over-feeding is unsatisfactory in amateur hands. As the flower draws greatly on the plant resources, it is very desirable that where it is not needed (as in *Rhubarb* in the kitchen garden) that it should be cut off in the bud, and in ornamental plants the buds should be thinned to what the plant has power to expand properly, and the flowers (if not wanted for seed) should be removed as soon as they begin to wither.

Though moving is sometimes a good way of throwing a plant into flower, it is generally very injurious when the buds are formed and passing on to the flowering stage; when once they are brought into existence they require a free flow of food, and this should be particularly considered in preparing plants for forcing.

Pinks, *Heliotropes*, *Mignonette* and other similar favourites should all be prepared beforehand. Pinks should be the pipings of the previous spring nursed in beds through the summer, and potted towards the end of September. Plants of *Heliotrope* or *Mignonette* should be established by autumn; *Pelargoniums* should be cut back early in the summer, before they are needed for winter use, and *Roses* require still longer preparation.

The plant that is to flower in unnatural warmth at an unnatural time of year must be supplied with resources for its work, and not have exhausted its flowering powers during the summer. It should be

well rooted in its pot, with plenty of flowering wood ready to come into play, properly nourished when the stimulus of heat and moisture are applied, but the plant simply taken from the ground (perhaps after flowering during the summer), put into a pot and into heat at once, meets every difficulty unprepared, and in most cases will fail.

FIG. 42.—PROLIFEROUS ROSE, TO SHOW THE BRANCH-LIKE NATURE OF THE FLOWER.

FIG. 43.—PROLIFEROUS ROSE.

The time when a plant attracts particular attention by the beauty of its blossoms is just when it ought not to be meddled with. Any check that cuts off the supply of food just then, checks the development of the blossoms. But if it must necessarily be moved from a border it should be taken up with as large a ball as possible, shaded and supplied with sufficient moisture, or if in a pot, it is best to sink it, pot and

all, or take it carefully from the pot and plant it without separating the root fibres, leaving proper arrangement of the roots till after the flowering season.

HINTS FOR GATHERING FLOWERS.

In gathering flowers much injury is often caused by breaking off the spray of blossom with the fingers. Sometimes it is tough and will not come off, and a branch is torn away, or the whole plant comes up and is probably sacrificed; at the best a rough stump is left to die back, and cause unsightliness as the least part of the probable damage, whilst if the flower is neatly taken off by scissors or the clean cut of a knife (just above a leaf-bud where it is from a leafy spray), the wound heals, the plant is benefited, and the gatherer gets the exact morsel which he desires.

The periodic action of the plant system in times of opening and closing, and emission of scent from the blossoms, may be utilised for special needs. Lists of these plants would be out of place here, but amongst those which diffuse fragrance in the evening, the *Wall-flower* in spring, and later in the year the *Rocket*, *night-smelling Stock*, *white Lily*, and *Mignonette*, may especially be mentioned. The *Cattleya Eldorado* also gives its scent in the evening, and the *Epidendrum cuspidatum* from midnight till early morning.

In periodic opening and closing,

"The Marigold, that goes to bed with the sun,
And rises with him weeping,"

is a type of many. The early opening of the *Convolvulus major* may be turned to good account in the part of the garden looked on from the morning rooms of the family. *Oxalis corniculata rubra* shows its

FIG. 44.—POT BOUND ROOTS.

bronze leaves rather than its golden stars after mid-day; the *Chicory* is an example of closing in the afternoon; and in the number whose expansion is affected by time of day or by weather influence some care is requisite in selection for carpet-bedding. The effect here depending not on form, or scent, or varied beauties, but simply on colour, if one kind of blossom in the design is closed the whole may lose its beauty, not only from its absence, but from colours which are inharmonious being thus thrown together.

ARRANGEMENT OF COLOURS.

Generally speaking, the "complementary" colours are most satisfactory; that is to say, one of the three primary colours, red, or yellow, or blue, with the other two (which make up the "complement") blended into one tint (known as a secondary colour), to accompany it. Thus yellow, a primary colour, with its secondary, purple (composed of blue and red), go well together; so do blue and orange (composed of red and yellow), so also red and green (composed of yellow and blue). We can scarcely find a more beautiful natural grouping of colours than of purple *Foxglove* mixed with yellow *Broom*; in bedding-out, the orange *Gazania* and blue *Lobelias*, or blue *Salvias*, are satisfactory combinations, and the red *Pelargonium* owes part of its overwhelming popularity to combining colour-requisites in itself—the primary red of its blossoms with the complementary green of its leaves.

Combinations of white and red are particularly pleasing, for the obvious reason that red in the flowers and green in the leaves, supplying all that is necessary for complement of colour, the added white heightens the effect of the brightness and is a point of repose for the eye even whilst its own brilliancy is enhanced by the glowing tints at its side. White also is almost always beneficial as a dividing

mass in doubtful combinations of colour, and so is a difference in the height of the plants which will allow the tints of their foliage and its shadows to come into play.

The primary colours are apt to look too hard when used together, but taking blue and red as an example if we have a centre of blue *Agapanthus* with some red flowers round, the eye will pass over the foliage from one colour to the other satisfactorily, and the neutral tints of the different colours lying in the shadows, whether of leaf or flower, have always a softening picturesque effect. Red and yellow, which are painfully gaudy in combined masses, are thus, by the intermixture of white flowers, or green foliage, softened into picturesqueness, and effect may similarly be given to beds containing various shades of one colour. Combinations such as red and orange, or blue and purple, in which the primary colour is repeated in one of those of the secondary, are very difficult to manage without some similar addition or that of appropriate coloured leafage intermixed with the flowering plants.

The extent to which the subject might be pursued is boundless, whether in the grouping of colours, or their distant effects, by which a selection of quiet blue tints may give distance to some particular spot, or red or yellow blossoms enliven and bring near a monotonous background. In spring the eye takes pleasure in warm and sunny tints—golden *Winter-Aconite*, or *Crocuses*, and rich rosy purple *Erica carnea* enlivening the waking up of the year; in the summer with all the gorgeous beauty of tint around, the coolness of white and blue, and (especially near towns) plentiful leafage is often the most pleasing; and in autumn, in the decay of vegetation, and possibly in sprinklings of snow, there is satisfaction again in clear warm colour, cheerfully excluding all idea of decay or dreariness.

The flower like the leaf must have sunshine and food for its double work. We have only considered it here as giving us pleasure by its beauty, of its main work in continuing the race we may have something further on to say. O.

ON THE SOURCE OF THE CARBON OF PLANTS.

(Concluded from p. 185.)

EXPERIMENTS were made with plants of French Bean, *Nasturtium*, Gourd, and Sugar Beet, growing in the open air in pots in good garden soil. From these was selected a leaf, or the upper part of a stem with several leaves, still organically united with the parent plant, which was passed through the hole in the porcelain dish, under the glass shade, and carefully secured air-tight, and from injury to itself, by cork and wadding. The plants for comparison were as nearly alike as possible in every respect, and a control plant grew in the open air between the shades. Both etiolated seedlings, which became green as quickly without carbon-dioxide as in common air, and well developed green Gourd leaves, were tried. The Gourd leaves, which contained starch at the beginning, entirely lost it within a day or two in the atmosphere deprived of carbon-dioxide, while those in the other shade remained still full of it. The shades, and the contents of the dishes, were then changed, so as to bring the starchless leaves into the shade containing carbon-dioxide. During the day these became again full of starch; while within twenty-four hours it had quite disappeared from the leaves in the other shade. In a similar experiment with Sugar-Beet the control plant in the open air was covered with a black pasteboard box, and it was found that the leaves in the shade deprived of carbon-dioxide lost their starch at about the same rate as those in the dark. In no case was starch found in the leaves while they remained in an atmosphere without carbon-dioxide.

The second set of experiments was made with long leaves of *Bulrush* and *Bur-reeds*, which were etiolated, and then separated from the plants. With the same general precautions as before, the upper end of the leaf was inserted in the shade without carbon-dioxide, the lower in an atmosphere containing 5 per cent. of carbon-dioxide, whilst the space between was left free to the open air. This intermediate part was obscured by tin-foil, so that no starch could be formed in it at the expense of any carbon-dioxide passing through the tissues from the lower shade, and it was supposed that if such a phenomenon were possible the spacious longitudinal air channels of these plants might be

especially favourable to the transmission of the gas. These experiments usually lasted one day, and uniformly gave the same result. Starch was formed abundantly where carbon-dioxide was at disposal in the air, while the excess of it in the lower shade had no effect upon the portion of leaf in the upper shade, which remained entirely free from starch.

The apparatus when arranged was always placed in a light window, shaded by gauze blinds if the sun were too hot; and in these latter experiments it was an interesting circumstance that, in the lower portions of these rather thick leaves, more starch was formed on the side next to the window; therefore, in two cases a piece of looking-glass was placed behind the shade, when, being equally illuminated, starch was formed in equal abundance on both sides of the leaf. This variation in the starch formation, according to the amount of light, showed that that portion of leaf had not always used all the carbon-dioxide at its disposal, and that consequently there was an excess which might have passed upwards through the tissues.

The third set varied from these in having no part of the leaf exposed to free air, thus obviating the possibility of the carbon-dioxide being diffused into it in passing upwards through the plant. A glass vessel containing air without carbon-dioxide was placed within a large shade containing air with 5 per cent. of this gas; and a previously etiolated leaf, with its stem in water, was so fixed as to be partly in the one and partly in the other. After six or eight hours it was examined for starch. Without exception starch was formed abundantly in the parts in the large shade, whilst no trace of it was found in those in the inner vessel, even quite close to the junction between the two.

The remaining two sets of experiments were made to ascertain whether starch formation in leaves, in the open air, is accelerated by giving an excess of carbon-dioxide, either to adjoining parts of the leaves themselves, or to the roots. In the first case leaves separated from the plant were divided lengthways. One half, with the stalk in water, was in a shade with air containing 5 per cent. of carbon-dioxide, its upper part projecting under the glass lid of the shade, which was luted with grease, into the open air. The other half of the same leaf was laid on the lid, on filter paper soaked with boiled water to keep it moist, and put as near as possible to the projecting piece of leaf. In the other cases etiolated leaves, organically united with plants whose roots were in rich humus soil, were divided lengthways; one half, quite cut off, was laid near to the other, and the two were examined and compared after some hours' exposure in sunlight. The results of both these sets of experiments were uniformly the same; careful examination showed that starch was formed as readily and plentifully in those portions of leaves excluded from any other source of carbon-dioxide than that in the air surrounding them, as in those having an excess of it at command.

From these experiments Dr. Moll concludes that starch is never formed in leaves in an atmosphere deprived of carbon-dioxide, however much of it may be at the disposal of the other, under or above-ground, parts of the plant; nor can starch-formation be accelerated in one part of a leaf by an excess of carbon-dioxide being at the disposal of another part of it, either in the air, or through the roots.

The results of these elaborate experiments are doubtless in accordance with the direction of those of other modern inquirers on this subject. At the same time it will probably be felt, that, when long-accepted opinions, which many well-known facts seem to favour, are held to be called in question, we may still ask for further confirmation, before accepting as decisive, conclusions depending on the exact interpretation of experiments made with living organisms exposed to somewhat artificial conditions. It may be hoped, however, that this further instalment of evidence in a given sense will incite to further research. *Nature*.

Garden Operations.

PLANT HOUSES.

GREENHOUSE HARD-WOODED PLANTS.—Now that a considerable portion of the stock are out in the open air, it will give an opportunity for carrying out any alterations or repairs that may be needed, especially such as re-arrangements of or additions to the heating power. In the whole routine of gardening there is no more false economy than a deficiency of piping. Where this exists, in very severe weather, it necessitates a continual use of the poker in

pushing the fire along, the result of which invariably is an increased consumption and waste of fuel. Wherever there is an insufficiency of heating surface, either in houses that have to be kept to a high temperature, or in such as where the requirements are confined to simply excluding frost, I would strongly advise the introduction of additional piping at the present time, when some of the plant houses being comparatively empty, gives an opportunity for disposal of any portion of the stock that is grown where such additions or alterations have to be made. The same holds good in reference to boilers. There are hundreds of places, large and small, throughout the country where it may be said that the existence of large numbers of valuable plants is dependent through trying winters upon the endurance of boilers, in many cases so constructed that their holding together when hard pushed in severe weather can never, with anything like certainty, be calculated upon, even so much as a single week, although they may go on for years doing the work required of them; but either sooner or later, from the defective principles upon which they are made, they give way when their services can be least dispensed with, and where often, with every contrivance and makeshift that can possibly be resorted to, destruction, or serious injury is inflicted, frequently upon large portions of the stock. Where any heating apparatus of a doubtful description exists there is nothing like replacing it in time, and at no season of the year is there so good an opportunity as at present. Re-glazing, painting, repairs of brickwork, and lime-washing, can also now be carried out with much more convenience than when the houses are all filled with the general occupants. One thing I would urge upon those who have not had much experience with plant structures; that in all houses and pits that are kept hot and moist, the wood-work gets saturated with water, and unless thoroughly dried before the application of paint the work is simply useless, as the paint will not adhere for any length of time to moisture-charged timber, and even if it did its effect as a preservative would be of no avail. With metal houses it is not a bad plan to apply a coat of paint inside every year, as by this means the unsightly appearance, and to some extent injury of the plants by rust-impregnated drippings upon them is avoided. In plant-houses of all descriptions there can be no greater mistake committed than letting them go too long without paint. If no painting is required, the whole of the wood-work, both inside and out, will be benefited in looks as well as reality, by being well washed from the dirt accumulated thereon. In houses where a high temperature with considerable moisture is kept up, the slimy *conferva* that establishes itself upon the woodwork, if allowed to remain, hastens its decay.

SOFT-WOODED GREENHOUSE PLANTS.—The earliest large-flowered *Pelargoniums*, that bloomed in April and May, and were subsequently headed down after being sufficiently hardened off, will by this time have broke, and made several leaves to each shoot. They should at once be shook out and potted, as it is much better to pot these earliest flowered plants as soon as ready than to put it off until the later cut-down portion are in fit condition, as if the partial rooting necessary to subject them to at the time of being shook out is deferred till a considerable amount of growth has been made, it will receive a check that will interfere with the progress of the plants through the autumn, and this portion that are re-potted in advance of the others will come into flower earlier than them. There are now a number of very dwarf free-blooming *Pelargoniums* with somewhat irregular flowers that for decorative purposes are much superior to the show kinds. Many of them have naturally an early flowering habit, amongst which are *Duchess of Edinburgh*, white fringed flowers, with a small purple blotch at the base of the petals; *Empress*, white, with violet pencillings, also fringed edged; *Madame Charles Keteleer*, white centre, dark spot on the top petals; *Triomphe de St. Maudé*, deep crimson, dwarf habit, and a most profuse flowerer; *Quadron*, white, dark spot on upper petals, flowers fringed; *Queen Victoria*, carmine, edged with white; *Duchesse de Morny*, rosy petals, maroon spots; *Digby Grand*, white, dark spot on upper petals, fringed edges. The above are a selection of the very best decorative *Pelargoniums* grown, and amongst the most serviceable conservatory plants for spring use, as the naturally short-jointed habit of most of them prevents their drawing up weak like the large-flowered show kinds are liable to, when stood close together in the way that becomes necessary in a house devoted to flowering plants. Seeds of *Cyclamens* should now be sown. Some growers prefer peat in which to grow these plants in all their stages, from the seed-pan up to large-sized flowering bulbs. With me they always succeeded best in good fibrous loam, with one-sixth of leaf-mould, and rotten manure in equal parts added,

and enough sand to keep the soil open. The Cyclamen seeds being somewhat large, will bear covering a little deeper than things of a smaller character. Place the pots at once in a pit or house where they will have a little more warmth than in an ordinary greenhouse, keeping the soil slightly moist until they vegetate, when they ought to be stood close to the glass, and kept on growing through the autumn and winter in an intermediate temperature, pricking them out when large enough to handle, a dozen together, in 6-inch pots. Bulbs of these that have been stood out-of-doors after flowering should, when they have commenced to grow, be shook out, and repotted in soil such as above advised. They ought not to be subjected to this operation until they have begun growth; if potted whilst at rest many of the roots start very slowly or not at all. The present fine strains of this flower have few equals through the winter and spring as decorative subjects, but, as might be supposed from the habitats where their progenitors grew naturally, they are averse to a dry atmosphere; when submitted to such they make very slow progress, and almost invariably become affected with red-spider and aphids, which if allowed to remain on them for only a short time destroys the foliage to an extent that rinos their growth for the season, the corns at the same time appearing to get into a hard, stunted condition, from which they rarely recover so as to be of any use. *T. Baines.*

FRUIT HOUSES.

ORCHARD-HOUSE.—Several of the early Peaches of recent introduction are now ripening, and where a judicious selection of later kinds has been made, this department will give a supply of fruit up to the end of the season. When the fruit shows signs of ripening, the supply of water should be reduced, syringing discontinued, and the trees exposed to a free current of air. Later kinds will derive great benefit from liberal supplies of liquid manure and syringing for some time to come. To prolong the season as much as possible, a few trees may be removed to the open air, where with the temporary protection of spare lights, for throwing off wet, and a curtain of Nottingham netting, for keeping out birds and insects, the fruit will colour and finish better than if kept crowded in the Orchard-house. Remove all trees from which the fruit is cleared to the open air, and treat as has been advised for Cherries; a sheltered but thoroughly open situation will suit them best. Syringe occasionally to keep the foliage clean, and protect the pots from the powerful influence of sun by partially packing in dry fern or litter. Up to the present time there has been a great scarcity of wasps and flies, but should they put in an appearance, some very light material may be drawn over the ventilators, which will now be left open day and night. Unfortunately for amateurs and nurserymen, the Peach and Nectarine lists have been extended with varieties having the prefix "early" as their only recommendation. I have found Early Grosse Mignonne, Abee, Early York, Hales' Early, and Early Ascot, first rate in size, colour, and quality. For succession Dr. Hogg, Grosse Mignonne, Royal George, and Kensington, Bellegarde and Stirling Castle. For coming in late, Barrington, Prince of Wales, and Walburton Admirable, Violette Hative, Nolesse and Dymond, should be in every collection; also Albert Victor and Stanwick Elruge Nectarines. Older varieties are too well known to require naming in this list. *W. Coleman.*

PEACHES AND NECTARINES.—The keeping of the foliage in a healthful state as long as possible, and the maintenance of a proper degree of moisture about the roots, are the predominating points which are notable in the management of these subjects at the present season. For these ends it is, therefore, necessary to give the trees heavy syringings frequently, particularly during hot and arid weather; and the borders, "especially inside ones," heavy waterings likewise occasionally. The growths on the trees in early-started divisions will soon, if not already, be showing indications of ripening. When this is the case, and the buds are becoming prominent, keep the house constantly open to the utmost extent, and, if practicable, it is preferable, in the case of very early forced trees, to expose them altogether, by removing the sashes entirely. The advantage accruing to the removal of superfluous shoots where they were too thickly set have been adverted to in the case of early forced trees in a former Calendar; it will, therefore, only be necessary now to advise the practice to be applied in a similar way in the case of later started trees. If any alterations be necessary in the way of root-pruning or partial lifting of any of the trees in the early house, let it be done as soon as the buds are tolerably well developed; for this purpose have the needful requisites on hand in readiness; a slight addition in the way of fresh soil is very stimulating and beneficial to such trees occasionally. Pure loam, with a slight admixture of sharp sand or road-side parings, cannot, as a mixture, be surpassed for this purpose. Let the leaves which fall from the trees be collected every day for the sake of tidiness, and, moreover, as a means of extinguishing in some degree

any insect pest which may exist upon them. *G. T. Miles, Wycombe Abbey Gardens.*

CUCUMBERS.—Where winter Cucumbers are in constant demand, another sowing of Telegraph or some other favourite kind should now be made for filling up the different compartments as they are cleared of Melons. A very important item in the successful management of these plants through the winter is cleanliness, and as Melons are very subject to red spider, too much attention cannot be devoted to the thorough cleansing, washing, and painting of the pits, before the plants are tured out. If the old system of growing on hills is followed a small quantity of good turfy loam, with a liberal admixture of old mortar, and a sprinkling of soot for the destruction of worms, will grow the plants sufficiently strong and firm without the aid of animal manure. When they reach the trellis, and young roots begin to show through the soil, a layer of fresh compost may be added, but large quantities should never be given at one time, as Cucumbers always grow best when the roots are working near the surface of the bed. Houses intended for coming into bearing after Christmas should be relieved of their present occupants, and put into through working order in time for planting early in October. Pots plunged in fermenting material, or placed over the pipes, are better than hills for this work. Get together a good supply of the different kinds of turf, now in fine condition for winter and spring use. Stack it in high narrow ridges out-of-doors and protect with thatch or shutters, before bad weather sets in. To give time for the preparation of houses for winter work, plants in pits and frames should be made to do duty as long as possible by a free use of the knife, frequent top dressings and liberal supplies of liquid manure. The linings should also be kept turned and renovated, otherwise the plants will collapse when cold nights set in. *W. Coleman.*

KITCHEN GARDEN.

In no part of the year is the benefit to be derived from a liberal application of water and liquid manure more apparent than at the present. As a general rule we have at this season to contend with a dry and parching atmosphere, which in the process of elaboration, or the pumping up, or perhaps ascent of the sap, very soon exhausts any supply the roots are able to obtain, and they thus become dependant upon an artificial supply, and this should be supplied to all growing crops in as liberal a manner as the amount of labour and conveniences at command will permit, either with strong liquid manure from the tank, and pure water alternately, or constantly with a highly diluted solution of liquid manure, say five to one in proportion, less or more according to strength. Without these applications, and continual surface stirring, it is useless to expect tender and succulent vegetables and salads. For this reason we have constantly drawn attention to the necessity of paying particular attention to the practice, and those who have been able to follow it cut in a liberal manner will now be able to appreciate its great benefit. Of course all these injunctions to follow this or that practice pre-supposes that, where such things are expected from a gardener, there is placed at his disposal proper materials and the amount of strength necessary to apply them. I greatly fear that it is very often the want of these, and of consideration on the part of employers as to the time which such operations require to be efficiently performed, which causes such unjust dissatisfaction in many cases, where a trifling outlay at busy times when operations press would make all the difference. The labour which the continual applications of liquids to growing plants involves, may be very much economised by following up the practice (so often recommended in these columns) of a systematic course of mulching, and, as at this season the manure from the stables is not in such immediate request at at other seasons, it is good practice to shake it over and, retaining all the droppings and short stuff for the formation of Mushroom beds, to make use of the long litter to cover over the surface of the ground after watering; this mulching is particularly applicable to late Peas and dwarf Beans, as well as between the rows of Scarlet Runners; it is also very useful for all autumn crops of the Brassica tribe, but not for those which are to stand through the winter, as a very free and succulent growth is much more liable to suffer from frost; for this reason Lettuces intended to stand through the winter should not have the soil too heavily manured, although for all intended for autumn and early winter use they should have the assistance of plenty of manure and liberal supplies of moisture to the roots. As soon as Onions begin to show signs of maturity by the tops turning colour, let them be pulled up at once to avoid rosetting, which is very destructive to their keeping properties. Now is the time to sow the different varieties of Tripoli Onions to stand through the winter; the Giant Rocca, and the White and Globe Italian are reliable sorts, and with liberal treatment come very fine; at this season they should have a warm border, and not be sown too thickly. A sowing of Welsh Onion should now be got in; they are very

useful to draw young. Continue to make successional sowings of Turnip Radishes; also another small sowing of Bath Cos Lettuce. A late sowing of mixed sorts of Edivive to stand in the seed-bed through the winter will be found very useful in spring. Remember to get in a good breadth of Veitch's Red Globe Turnip within the next fortnight; these will come in after Christmas and on into the spring. On or about the 26th of the month sow the main crops of Cauliflowers to stand through the winter in handglasses, frames, and at the foot of south walls. The Frogmore forcing is a good sort to come in early; Early London Market and Large Asiatic for the main crop, and Cattell's Dwarf Late, are good sorts for succession. They should be sown on a warm and sheltered border in the south of England, but are better sown under glass further north, taking care, however, to expose them very freely to the air to harden and keep them dwarf. Commence at once the earthing up of the main crops of Celery, observing first to see that they have a thorough soaking of water the day before, and next to put sufficient earth to allow of its forming a level at the top to catch the water instead of a ridge to throw it off. As the winter approaches the pointed ridge becomes a necessity, in order to prevent rotting, but at present it is a mistaken practice to bring the ridges to a point. At this season of the year a vast amount of vegetable refuse is sure to accumulate in this department, and must be constantly removed to the rubbish-heap, where if there is any annoyance arising from bad smells during the process of fermentation, it is a good plan to keep a strong fire at work, and throw the rubbish thereon. *John Cox Reddyf.*

THE CLIMATE AND THE FLOWERS OF ENGLAND.—We are so accustomed to complain of our climate, and to hear others do the same, that the warm exuberance of praise bestowed upon it by a writer in the *New York Tribune* comes as a refreshing surprise:—

"The man who could not be happy in England—in so far, at least, as happiness depends on external objects and influences—could not reasonably expect to be happy anywhere. . . . Here [London, July 7] the weather is literally blissful. . . . The sky is softly blue, and full of magnificent bronze clouds, the air is cool, and in the environs of the city is odorous with the scent of the new-mown hay; and the grass and trees in the parks—those copious and sweet lungs of London—are green, dewy, sweet, and beautiful."

The writer goes on to describe the beauty of an English Hawthorn hedge in blossom:—

"We have nothing comparable with it in Northern America, unless perhaps it be the Elder; and even that, with all its fragrance, lacks equal charm of colour. . . . English flowers, it must often have been noticed, are altogether exceptional for substance and pomp. The Roses in particular—though many of them, it should be said, are of French breeds—surpass all competition. It may seem an extravagance to say so, but it is certainly true, that these rich, firm, brilliant flowers affect you like creatures of flesh and blood. They are in this respect only to be described as like nothing in the world so much as the bright lips and blushing cheeks of the handsome English women, who walk among them and vie with them in health and loveliness. It is easy thus to perceive the source of those elements of warmth and sumptuousness which are so conspicuous in the results of English taste. This is a land of flowers. Even in the busiest parts of London people decorate their houses with them, and set the sombre, fog-grimed fronts ablaze with scarlet and gold. These are the prevalent colours (so radically such that they have become national), and when placed against the black tint with which this climate stains the buildings, they have the advantage of a vivid contrast which much augments their splendour. All London wears a 'suit of aubles,' variegated with a tracery of white, like lace upon a pall. In some instances the effect is splendid."

THE OLD HAMMERSMITH LETTUCE.—Had we not sown the Hammersmith Hardy Green Lettuce in the open ground in August, last year, we should not have had a Lettuce out-of-doors this spring, almost every one but this having succumbed to the winter. It was sown in a row at the bottom of a Plumb-wall in the third week of August, and thinned out so that those left stood in quincuncial order, forming a zigzag . . . row, 2 inches apart or so. In April . . . hundreds of people envied my row of . . . Hammersmith Hardy Green Lettuce, for it was a long row of some 120 yards, and we had them in great quantity during April and May. Being a dwarf green Cabbage Lettuce, a great many can be grown in a small space. It is an old-established friend, which I used to be very fond of, and this year it was a friend indeed, for I was in need. It is all very good having an eye to those big crisp Lettuces from France, but when we gardeners in the North find ourselves minus of these, we naturally fall back on our old acquaintances, and this is indeed a veritable and faithful one, being the hardest and most distinct type of Cabbage Lettuce—one which every gardener would be the better, and certainly none the worse, for having. *Henry Knight, Floors Gardens.*

THE
Gardeners' Chronicle.

SATURDAY, AUGUST 18, 1877.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, Aug. 20—Lee Bridge Horticultural Society's Show.
Royal Horticultural Society: Meeting of the
Fruit and Floral Committees, at 11 A.M.
General meeting at 3 P.M.
TUESDAY, Aug. 21—Coventry and Warwick Horticultural
Society's Show.
Flower and Fruit Show at the Agricultural
Hall.
Sale of Imported and Established Orchids
at Stevens' Rooms.
WEDNESDAY, Aug. 22—Sale of Dutch Bulbs at Stevens' Rooms.
THURSDAY, Aug. 23—Reading Horticultural Society's Autumn
Show.

IT is not long since we had occasion in these columns to give considerable prominence to an analysis of a work of Mr. DARWIN'S on the subject of the FERTILISATION OF PLANTS, by the Rev. G. HENSLOW, who took exception to some points raised by Mr. DARWIN, more especially as to the alleged necessarily injurious effect of what may be termed "in-and-in breeding." We have now before us another work of a similar character from the same pen.* It is hardly requisite for us to enter at such length into the subject of this volume as into that of its predecessor, and this for two reasons. In the first place the present volume is but an expansion, with many additions, of those memorable papers on the dimorphism of *Primula*, of *Lythrum*, of *Linum*, and other plants, which first appeared some years ago in the *Journal of the Linnean Society*. In the next place, the subject in its main features is so closely similar to that which formed the subject of *The Effects of Cross and Self-Fertilisation in the Vegetable Kingdom*, that, allowing for differences of detail, the same general remarks will apply in the one case as in the other.

In the year 1862 it will be remembered Mr. DARWIN first published his remarkable series of observations on the two forms, or dimorphic condition of the flowers in the species of *Primula*. It was not without some sense of humiliation and of wasted opportunity that florists and horticulturists found that they had been pottering over "pin-eyes" and "thrum-eyes" for generations, without having the slightest notion of the significance of the variations in question. Even from the restricted point of view of the professed florist, the meaning of the formations in question, and their direct practical bearing on the cultivation and selection of the forms most in consonance with his arbitrarily assumed standard were entirely overlooked. So-called botanists were, with very few exceptions, not one whit better. They had been splitting hairs, counting spots, wrangling whether this was a species and that a variety, discussing whether there were two or fifty British representatives of a particular genus, and so on, without troubling themselves in the least about the causes of the variations they observed in such minuteness of detail, still less about the practical meaning and significance of the observed facts. Instead of treating plants as manifesting ever active life and ceaseless change, and adaptation to outward conditions and inborn endowments, they treated them all as a schoolboy would do so many marbles. It is one of the special features of Mr. DARWIN'S work in all departments that he is the cause of work in others. No better test could be desired of the degree of influence exercised by a great thinker and a great observer than this. Accordingly, we find in this subject of dimorphism, as in others, that Mr. DARWIN'S experiments and deductions have stimulated a large number of observers at home and abroad. They have excited the attention of professed naturalists in America, in Germany,

and in Italy, where learned professors have been induced to observe and experiment for themselves, to expound and to extend Mr. DARWIN'S researches. Practical gardeners, like Mr. SCOTT, now of the Calcutta Gardens, and others have not failed to see the profound importance of these observations to their own pursuits. Amateurs have found a new and never-failing source of interest and amusement in observing and studying the endless adaptations, contrivances, and inter-actions designed by the great Architect for the welfare and perpetuation of His creatures. In every case, making allowance for differences in points of detail, substantial agreement with Mr. DARWIN'S main principles as regards the object of these dimorphic forms has been arrived at. The general result of the observations and experiments that have been made on these so-called "heterostyled" plants has been shown to be this—that to ensure the largest number of healthy seedlings the pollen from the anthers of one particular form or size of stamen must be transferred by insect agency or otherwise to the stigma corresponding in point of dimensions with the stamen. In this way there may be in one and the same species, two or three sexual pairs, as distinct practically as the pairs representing the sexes in another species. Without practical experiments this diversity cannot always be determined, the relative length of stamens and styles may vary; the structural arrangements may differ, and yet functionally there may be no diversity. DARWIN himself records how he has been deceived in this way; a caution is thus supplied deserving of careful attention. Where, however, the pollen grains differ in size, this dimorphism may be assumed pretty certainly without resorting to direct experiment.

In the introduction to the present volume, Mr. DARWIN adopts the old Linnean classification into "hermaphrodite" flowers, or those with stamens and pistils in the same flower, as in the Rose; "monœcious," or those in which the male and female flowers are separate, but on the same plant, as in the Hazel; "diœcious," or those in which the flowers of one sex are on one plant and those of the other sex on an entirely distinct plant, as in the Willow; and "polygamous," or those in which hermaphrodite flowers may be found on the same plant with male or with female, or with both flowers, as in the case of the Ash.

These four subdivisions, it is needless to say, were adopted from structural considerations only, before the physiological phenomena connected with them were thought of. To adapt them to the present state of knowledge various subdivisions and modifications have to be made. Thus Mr. DARWIN admits two sub-divisions of hermaphrodite plants, viz:—1, heterostyled or di-tri-morphic flowers, as in the Primrose; and 2, "Cleistogamic" flowers, or flowers adapted expressly for self-fertilisation, inasmuch as the flowers either do not expand, or their buds are inconspicuous, and thus offer no attractions to insects. Such flowers are very common on Violets, though frequently overlooked. They yield more numerous seeds than the brighter coloured flowers.

Monœcious plants like the Hazel, which have the sexes in different flowers on the same plant, may be sub-divided into two classes, according as the anthers are ripe before the pistil, or *vice versa*, the object clearly being to favour the cross fertilisation of different plants. Many hermaphrodite (structurally) flowers are organised in a similar manner.

Diœcious plants, or those with the flowers of the two sexes on different plants, must necessarily be cross fertilised, and as we have just seen many plants structurally monœcious are rendered practically diœcious by the different times at which the stamens and pistils respec-

tively come to maturity. Among diœcious plants the difference between the sexes is sometimes remarkably great: thus among Restiaceæ, sedge-like weeds of Australia and the Cape, it sometimes happens that the male and female plants of the same species are so different that the female much more closely resembles the male of a totally different genus, than it does the male of its own species. Of course this applies only to the general habit and appearance of the stem and foliage, and not to the intimate structure of the flowers. Lastly, we come to polygamous flowers, which Mr. DARWIN divides into two sub-groups, according as the three sexual forms are found on the same individual or on distinct plants. Of the latter case the Ash is an example; some trees bear in some seasons male flowers only, others female flowers only, and others hermaphrodite blossoms. The Ash then may be classed as triœcious. On the other hand, the common Maple bears all three sorts of flowers on the same tree, and is thus monœciously polygamous. Other polygamous plants may be grouped into "gyno-hermaphrodites," inasmuch as they exist under two forms,—one of which bears female flowers only, the other hermaphrodite flowers, as in the common Thyme. Some of the Chenopodiums bear on the same plant hermaphrodite and female flowers, and may therefore be called "gyno-monœcious." On the other hand, there are "andro-monœcious" plants, or plants bearing on the same individual male flowers and hermaphrodite flowers in some species of Galium. No case seems to be known of "andro-diœcious plants," or plants producing hermaphrodite flowers on one individual, and males on another. Probably now that attention is prominently drawn to it, illustrations of this form may be found.

We have alluded to these matters in some detail because we believe that the mystery of "bad setters" among Vines and Cucumbers, the existence of "blind Strawberries" and other similar phenomena will find their solution in the facts above mentioned. Indeed, we know already enough to be sure in a general way that this is so. External conditions of temperature and manuring, though not without influence, are less potent in effecting important structural changes than is generally imagined. Thus, in spite of the natural variability of the Cowslip, upwards of seven hundred plants raised by Mr. DARWIN by artificial fertilisation (the visits of insects having been prevented), and treated in the most varied manner as regards food and temperature, yielded no variation whatever except in size. This is an important confirmation of some results obtained in the experiments on the action of manures at Chiswick, inaugurated by the Scientific Committee, some few years since. The fact that a tree will in one year bear male flowers only, and in the next hermaphrodite flowers only, seems to show, however, that external conditions may have some effect, as also the curious case mentioned by the late Mr. HANBURY, of a Papaw, the produce of a female plant which, when grown at Mentone yielded hermaphrodite flowers. But here, for the present at least we must stop, our immediate purpose being to draw attention to Mr. DARWIN'S latest book, not to discuss the general principles of sexuality in plants.

THE main provisions of the "DESTRUCTIVE INSECTS ACT, 1877," the full text of which is given in another column, are directed against the Colorado beetle. Not a word is said about any other insect, in spite of the title of the Act. The Act provides that the Privy Council may, if it see fit, prohibit the importation of Potatoes or Potato stalks and leaves, or of any substance likely to introduce "the said insect." The Privy Council may take steps to prevent the spread of the said beetle, and direct the removal

* *The Different Forms of Flowers on Plants of the same Species.* By Charles Darwin. (Murray.)

or destruction of the crop if necessary, and prohibit the sale of living specimens of the insect. Compensation may be given in cases where the crop is destroyed to the extent of not more than three-fourths of the value of the crop at the time. The local authorities charged with the carrying out the provisions of the Act are the same as those empowered to act in the Contagious Diseases (Animals) Act of 1869.

ledge of common things of the greatest moment to them in their respective businesses.

We have been plied lately with numerous specimens of ladybirds and other common insects in all stages. That farmers and gardeners should not know their friends, but should confound them with foes, is a truly lamentable circumstance, and one which will never be met till instruction in elementary natural history

the ignorance it has brought to light, form sufficient witnesses of its importance. We repeat, then, that however suitable the Act may be for the exigencies of the moment, proper instruction in "common things" will in the end be far more beneficial in all ways.

— We are glad to take advantage of the opportunity offered by the recent exhibition by Messrs.

FIG. 45.—LISIANTHUS RUSSELLIANUS.

So far well. The Potato crop is already in course of being lifted, so that for this year, at any rate, there will not be so very much food for the insect should it unhappily spread. Between now and next spring it may be possible to instil a little more knowledge of common insects into the heads of school children and others—a knowledge which in the long run may, perhaps, be as useful as any Act of Parliament. As it is, it is lamentable to see so many farmers and gardeners completely destitute of a know-

forms an essential part of the education of children, at any rate in rural districts. Almost every child is a born naturalist, but it is rarely that his natural faculties are developed by proper training. So far as mental discipline is concerned, natural history, properly taught, is at least as valuable as any other subject that enters into the school curriculum, and much more so than some; while, as far as regards adaptation to the requirements of life, the present scare about the Colorado beetle, and

VEITCH & SONS of an example of LISIANTHUS RUSSELLIANUS, to draw attention to the remarkable merits of this gorgeous plant, which seems to be very little known at the present day. It was introduced from Texas in 1835, and in our earlier volumes will be found many records of its successful culture. The late Mr. JAMES CUTHILL, of Camberwell, achieved a reputation for growing this plant, and his mode of treatment is published at p. 36 of our volume for 1844. Mr. W. THOMSON, then of Wrotham Park, Barnet, also gives an account of his method of treatment (1843, p. 304), and concludes by stating that,

in 1839, he had a plant with above 300 blooms expanded at one time, and that during the season of 1843 he had grown upwards of two dozen plants without a single failure, some of them between the beginning of July and the end of September, producing from 400 to 600 blooms. Both these eminent growers recommend to sow the seed in March, and both agree that no plant is more susceptible of injury from the application of water during the winter season. Our illustration annexed (fig. 45) was drawn from MESSRS. VETTER'S plant.

— A supplement to the *London Gazette*, issued yesterday, contains two Orders in Council, under the Destructive Insects Act (see p. 198), applicable to Great Britain only. The first, which is to take effect from and after August 31, provides as follows:—"It shall not be lawful for any person to land POTATO HAULM, leaves, or stalks brought from the United States of America, Canada, or the German Empire. The Commissioners of Her Majesty's Customs may in any case, if they think fit, order the collection and destruction of any sand, dirt, or other refuse imported with Potatoes brought from the United States of America, Canada, or the German Empire, and detain the Potatoes until such destruction has been effected." The second Order provides:—"If the owner of, or any person having under his charge, any crop of Potatoes, or other crop, or vegetable, or substance, finds, or knows to be found, thereon, the Colorado beetle, in any stage of existence, he shall, with all practicable speed, give notice of the same being so found to a constable of the police establishment for the place where the same is found. The constable shall forthwith give notice thereof to the Local Authority; and the Local Authority shall forthwith give notice thereof by telegraph to the Privy Council. It shall not be lawful for any person to sell, or expose or offer for sale, or keep, any living specimen of the Colorado beetle, in any stage of existence, or to distribute in any manner any such specimens. If any person fails to do anything which he is required by this Order to do, or does anything in contravention of this Order, he shall be deemed guilty of an offence against this Order, and shall for each offence be liable to a penalty not exceeding ten pounds."

The Bristol correspondent of the *Times* telegraphed on Wednesday night:—"This morning considerable interest was taken in the discovery of a live Colorado beetle in the Cape mail carriage on its arrival at Bristol. As the same mail carriage had been used on Monday last for the conveyance of the American mail from Plymouth to Paddington, the sorters were of opinion that, instead of coming from the Cape mail, it had been deposited from the American mail, and had remained in the mail carriage till discovered lying on the floor by the sorters. Having been properly secured, it was sent on to London to be delivered into the hands of the foreign branch Post Office officials."

— *Apropos* of the forthcoming INTERNATIONAL HORTICULTURAL TOURNAMENT, to be held at CARLISLE, on September 6, 7, 8, next, it may be interesting to our readers to note a few of the special local features of that interesting and historical city. Approached as it is by the London and North-Western Railway, and the Midland from London and the south, by the North-Eastern from Newcastle and the east, by the Maryport and Carlisle from Whitehaven and the west, and by the North British, the Caledonian and the Glasgow and South-Western from all parts of Scotland, whilst a short line to Silloth connects it by boat to Ireland and the Isle of Man, it may be said to hold a truly central and international position, with direct access from all points of the compass. The position chosen in which to hold the show is a level hollow, or field, about 27 acres in extent, called the Sorceries, belonging to the Corporation, and kindly granted by that body to the Flower Show Committee for the purposes of the show. It is every inch historical ground, and we are quite sure that on the show days many a Saxon and Scot will grip hands in a friendlier way than did their forefathers on the selfsame spot; and we may fondly hope that in the heat of horticultural rivalry none of them will invoke the spirit of some fiery, fighting, great-great-grandfather. From a large central marquee will extend four tents, each above 100 yards long, in the shape of a cross. One of these will be appropriated to fruit, another to vegetables, another to stove and greenhouse plants, and the fourth to dinner-table decorations, bouquets, &c., whilst the central marquee will be occu-

ped by large Palms, Tree Ferns, and plants which require large head-room. Spaces for refreshment rooms, for the band, &c., are also marked on the same large scale, and, as the music will be of the best description, a delightful promenade by the banks of the Eden will be enjoyed. Above frowns the old castle, which will interest many, as will also the fine cathedral and its monuments. Conspicuous near by is the fine bridge which spans the Eden at this point, giving access to the ragged banks of Eterby Scaur on the left and to the lovely grounds of Rickerby Park, the seat of Mills McInnes, E.-q. These grounds are open to the public, and are much frequented. Proceeding northwards, we come to the romantic village of Stanwix, through which passed the high road between England and Scotland in the old coaching days. Proceeding onwards down the Scotland Road, the visitor will come upon the extensive nurseries of MESSRS. LITTLE & BALLANTYNE, which, to the horticulturist, will be well worthy of a visit. Here the growth of Larch, Scots Fir, and hardy trees in general, is carried out on the largest scale, Roses and fruit trees are also largely grown. The hot-houses are well stocked with the usual stove and greenhouse plants most in demand. To those fond of the old-fashioned herbaceous plants which used to gladden our younger eyes, and which the rage for Mrs. Pollock and her class has driven out of our gardens, the herbaceous ground will form an attraction, and choice Alpines are grown in large quantities, to meet the ever-increasing demand. These are all correctly and distinctly labelled, and shrubs arranged in an effective and masterly manner. The Pinetum will also be noticed, where specimens of all the varieties of Conifers which have been introduced to this country have been planted, as it were, into a trial-ground, to show their aspects, habits, and capabilities. Here also is the original plant of the new *Wellingtonia gigantea pendula*, a tree destined to form a part of every Coniferous collection in the world, and a fit companion for its noble congener, the original *Wellingtonia gigantea*. Bounding the eastern side of the nursery are the remains of the old Roman wall which so much attracts antiquaries, and along the line of which so many interesting relics of our earlier history as a country have been found. About 10 miles farther on the Scotland road is Netherby Hall, the seat of Sir F. U. Graham, for ever celebrated by Sir W. Scott as the scene where "Young Lochinvar came out of the west," and so cleverly abstracted his bride. Next week we purpose to give a short sketch of the most noteworthy places in the neighbourhood of the city which may be worth visiting.

— In connection with a series of Grand Concerts to be held in the Agricultural Hall, Islington, during the week commencing Tuesday, August 28, it is intended to decorate the building with flowers and fruit; and with the object of securing the best possible decorations a number of prizes varying from £5 to £50 will be given for artistically arranged groups, of various sizes, of fine foliage plants, flowers or fruit; for the best stalls of plants, artificial flowers, and fruit, garden tools and appliances, horticultural buildings, fountains, vases, tiles, and other ornaments. Entries close on August 21, and schedules, which will be ready in a few days, may be obtained from Mr. F. W. WILSON, Agricultural Hall, who has been entrusted with the management of the exhibition.

— The Peach wall at Chiswick affords this season an instructive lesson on the value of some of the new varieties of Peaches and Nectarines raised by Mr. RIVERS, as several of them are bearing good crops, whilst the old-established sorts growing by their side are almost destitute of fruit. The new and remarkably handsome LORD NAPIER NECTARINE may be seen there now in grand form, every tree of this variety carrying a fine crop of fruit, large in size, brilliant in colour, and what is of most importance nearly ripe, and in advance of all others. It was raised from seed of the Early Albert Peach (also one of Mr. RIVERS' seedlings), and, as an early, good looking, and fine-flavoured variety, has no rival. Next in point of earliness to that good Peach, Hale's Early, must be placed Mr. Rivers' seedling, named Goshawk, the fruits of which are of good size, rich soft colour, and excellent flavour. It is a very fine Peach, and in before Early York. As a late Peach *Dusse Tardive* is one of the best of good sorts, and much deserving wider cultivation than it now obtains.

It does not come in till the end of September, has the fine appearance of a Bellegarde, and a delicious flavour. This is also one of the few sorts bearing a crop this year.

— We are requested to state that Mr. ROBERT OSBORN has purchased, as from January 1 last, the nursery and seed business carried on for many years at Fulham and Sunbury by his late uncle and father, WILLIAM and THOMAS OSBORN, and his grandfather, ROBERT OSBORN. This arrangement has received the sanction of the Judge of the Chancery Division of the High Court, under whose direction and control the business has been conducted for the last few years.

— Messrs. DICK RADCLIFFE & Co., 129, High Holborn, have, we are informed, been awarded a silver medal at the Cape Exhibition for seeds, and also one at Oporto, for ferneries and aquariums.

— Mr. THOMAS ELSLEY, of 32, Great Portland Street, W., has brought under our notice an ingenious instrument for the cleansing of trees from caterpillars, invented by a Frenchman, M. DAMANIOU, of Rozère, near Sainte Foy-la-grande, Gironde, and which, after a careful trial by the engineer-in-chief in charge of the public thoroughfares in the department of the

Seine, has been adopted by the French Minister of Public Works, for the cleansing of trees on the public roadways. The instrument consists of a brass tube about 4 feet long and 1 inch in diameter, enclosing another of the same length, which is worked by telescopic action. To one end of this an indiarubber tube of equal length, with a mouthpiece, is affixed; and at the opposite end is a small brass receptacle for oil, with a fine spray nozzle. Petroleum, being the most deadly liquid known for the destruction of caterpillars, is preferred to all other oils for use in this instrument, through which it is blown in the form of a dense fine spray on to the nests of the insects, causing immediate destruction to them without injuring the trees. We have not put the instrument to a practical test, but have no doubt of its capability for the work intended, and have much pleasure in bringing it before the notice of our readers.

— In addition to the singular facts which we have recorded lately with reference to the non-production of offsets by certain varieties of Tulips, we may note another circumstance, equally peculiar, which Mr. PARKER, of Tooting, brought under our notice a few days ago, and which consists in a variety raised more than twenty years ago, called Goldham's Mary, which always produces an offset in the axil of the first leaf, and reproduces itself in no other manner.

— A remarkable peculiarity of the season is well illustrated in the astonishing growth generally being made by FRENCH BEANS. Some of the varieties have attained more than twice their usual height, and especially is this the case at Chiswick with such varieties as the Negro and Sir Joseph Paxton. The former is quite 2 feet high, and the latter, one of the dwarfest of all, has reached nearly 3 feet.

— That HOLLIES will thrive well in LONDON it needs but a visit to Victoria Park to show. Surely, winter and summer, few things look better than our native Holly! For town squares what more handsome?

— One of the most exquisite of PELARGONIUMS raised by M. SISLEY, named after Dr. DENNY, and exhibited by Mr. CANNELL, was handed round at the meeting of the Pelargonium Society. Its colours are those of the finest *Masdevallias*. The flower is irreproachable in size, shape, and substance; the colour mostly a rich magenta, while on each of the two upper petals occurs a spot of glowing crimson scarlet, the effect of which is quite marvellous. It is probably the most beautiful of all the varieties of which we have any knowledge.

— A somewhat CURIOUS EXPERIENCE IN PLANT JUDGING occurred a few days since at the Shepton Mallet Flower Show. The class for six Fuchsias was under consideration, and one lot of plants were so good that there was no question as to

their fitness for the first place, but for the fact that two named Arabella and Victoria were so remarkably alike in growth, foliage, and flower that it was almost impossible to distinguish them as distinct varieties. After much doubt, one of the judges fortunately proposed to compare the length of the styles of the flowers, and this settled the matter, as those of one kind were in all cases at least half an inch longer than those of the other. We are very much afraid the distinction is not to be relied on.

— How is it various species of *SMILAX* are not more grown as climbers? The rich green colour of their foliage ought to prove a recommendation. At Kew they are quite hardy, and grow vigorously. Fine specimens may be seen just now in the borders near the temperate house.

— The *PELARGONIUM SOCIETY* held its annual meeting on Wednesday last, at Chiswick, by permission of the Royal Horticultural Society. There was a large attendance, and most of the members now enrolled signified their intention of continuing to support the Society. Following the unwritten law which had been adopted at former meetings, and which required that the chairman should be changed by a kind of annual rotation, Mr. G. F. Wilson retired from that office, receiving the cordial thanks of the Society for his services, and was replaced by Mr. Charles Turner, who has been for the last year vice-chairman. Mr. J. McIntosh was selected to succeed Mr. Turner, and Dr. Denny and Mr. T. Moore were respectively re-elected treasurer and secretary. The general committee was constructed as before, with the substitution of Mr. E. Foster, Mr. James, Mr. H. Veitch, and Mr. G. F. Wilson, for Mr. Laxton, Mr. Rollisson, and Mr. Williams; and the executive committee was strengthened by adding the names of Mr. W. B. Kellock and Mr. Kinghorn. Considerable discussion took place as to the arrangements for the coming season, it being elicited as the unanimous opinion of the meeting that the exhibition should be held at South Kensington early in June, the completing of the arrangements being left to the executive committee. The members afterwards lunched together in the great vinery, and if not exactly beneath their own Vines, at least beneath a glorious canopy of Grapes, the crop being one of the finest we have seen. The Pelargonium Society sets a good example to other kindred societies, inasmuch as while preserving its own independence, it recognises the claims of the Royal Horticultural Society as the head centre of all the horticultural societies of the kingdom.

— *AURICULAS* are apt to throw up their flower-stems at this season of the year, much to the concern of some cultivators, as all autumn flowers (except in the case of seedlings, which may afford some clue to their probable character), are generally unsatisfactory. It is well to pinch out the truss of flower buds only, not the stem, as when the latter is pinched away the base of the stem will sometimes rot and spread it to the plants. If only the buds be pinched out, the stem gradually fades away, and does not become an agent for spreading rot. It may be remarked that the moist summer appears favourable to the development of the Auricula, and that collections of plants are looking remarkably well.

— The Gardens of the *MANCHESTER BOTANICAL AND HORTICULTURAL SOCIETY* at Old Trafford are now in such excellent condition under the admirable management of Mr. BRUCE FINDLAY, as to well repay a visit. Everything appears so luxuriant that it is difficult to realise the fact that the gardens are only some two miles or so from the Exchange at Manchester, as the crow flies. The order observed in the numerous plant-houses, and the condition of the plants are particularly noticeable, the largest and smallest plants alike being clean and healthy in appearance. In one of the greenhouses were some capital specimen flowering plants of *Francoa appendiculata* and *F. racemosa*, most attractive subjects for greenhouse decoration at this season of the year. A well-grown specimen of the handsome New Zealand *Grevillea longifolia* was particularly noticeable. The fine stretch of green sward, the winding walks around the circumference of the gardens, and the many flower-beds and borders, are also in fine condition, and they afford an excellent lounging place for the citizens of Manchester who are Fellows of the Society. The beds in the long annex,

which is so useful on the occasion of the Great Whitsun Shows, are planted with Dahlias, and there will be an attractive Dahlia garden when the plants get fully into bloom. How difficult it is getting to carry on practical gardening operations in the immediate neighbourhood of Manchester is shown by the fact that there is scientific authority for the statement that every twenty-four hours there is discharged into the atmosphere within a radius of from 4 to 6 miles from the Manchester Exchange, 60 tons of sulphuric acid; and if a dry time happens followed by rain, the acid is washed down into the soil, and Roses, Tulips, and many other things are seriously affected by it. Let us hope the Manchester Botanical Gardens will long be spared such a terrible scourge.

— If a forcible illustration of the generally uncongenial character of the season were required, it would be found in the fact that there has not been held this summer any *GOOSEBERRY* show in Sheffeld, where the berries have exceeded 14 dwt. in weight. The lack of warmth, and more particularly of sun, have prevented the berries acquiring that plumpness so necessary to weight and a foremost position on the exhibition table. In a favourable season the finest exhibition varieties will attain a weight of 34 dwt.

— The horticultural body generally, and especially those members of the profession who are in the habit of attending the exhibitions of the Manchester Botanical and Horticultural Society at Old Trafford, will learn with much satisfaction that the Council of the Society have recently presented Mrs. FINDLAY with a bandsome tea and coffee service, in recognition of her kindness to the many visitors to the gardens on all occasions, and especially at the times of the great shows. Those who have partaken of Mrs. FINDLAY'S hospitality on these occasions, and experienced the genial welcome that is never denied to the greatest stranger, will be particularly gratified at this act of the Council, which manifests on their part a delicate appreciation of kindly services the value of which it would be very difficult to estimate.

— The *CARYOTA ALBERTI*, from North Queensland, named many years ago by *BARON VON MUELLER*, in honour of the late Prince Consort, and two years ago fully described in the *Linnaea*, has attained, according to Mr. W. HILL, in the Brisbane Botanic Garden since 1864 a height of 50 feet, and a circumference of the stem of 3 feet.

— A correspondent, writing from the neighbourhood of Winchester, informs us that a friend of his has not had a *CUCUMBER* to send to table this year owing to their all being *EATEN BY A CAT*, who was suspected and proved to be the depredator by placing some cut pieces before her, which she ate as though they were pieces of meat.

— The valuable natural history and miscellaneous library of the late Mr. John Russell Reeves was sold by auction recently, and realised £1415 11s. Amongst the choicer articles a series of 772 caricatures by Gillray sold for £185; a set of Gould's superb publications on natural history for £483 14s.; Curtis' Botanical Magazine, £93; Sowerby's English Botany, £16; Donovan's Entomology, £19; Curtis' British Entomology, £15 15s.; Doubleday and Westwood's Diurnal Lepidoptera, £20; Gray's Genera of Birds, £31; Wilson & Bonaparte's Ornithology, £17 5s.; Reeve's Conchologia Systematica et Iconica, £103 10s.; Zoological Society's Transactions and Proceedings, £42 14s., &c.

— An interesting case, showing how slight an alteration may cause a very great change in appearance, is presented to us by a specimen of *VALERIANA AURICULA* (Lamb's Lettuce), kindly sent us from the Isle of Wight by Mr. STRATTON. The flowers are rather more closely packed than usual, while the limb of the calyx is dilated into a large three-lobed, leafy cup, entirely altering the appearance of the flower. The corolla and the style are also more or less leafy.

— We observe that the *Floral Magazine* is now under the editorship of Mr. RICHARD DEAN, the illustrations being by Mr. J. N. FITCH, whose drawings recall those of his more widely known relative.

The figure of one of Mr. DOUGLAS' hybrid Columbines in the August Number is particularly satisfactory. Mr. DEAN'S special knowledge of florists' flowers, and his connection with the brotherhood, will be of great service to the magazine.

— *HERBACEOUS PLANTS* are happily more in vogue than they were ten years ago—the eternal glare of "scarlets" has a little abated. At any rate, colours are better blended. Carpet bedding and "leaf gardening" have something to do with this, as the colours are softer, and blend better than those of the ordinary run of bedding plants. Still, flower beds and carpet beds, with their formality and artificial look, are only in place in certain localities and in small quantities. The herbaceous border, on the other hand, is capable of indefinite extension, while, if a plant is wanted for an isolated position, what grander plant can be chosen than an Artichoke (*Cynara*), a Gunnera, or an Acanthus, such as Mr. Ware's fine variety, called *Candelabrum*. For the back rows of the herbaceous border at this season the *Rudbeckias* are magnificent, the flowers yellow or rose lilac; with them may be associated the blue flowered *Echinops ruthenicus* with its singular globes of flowers, the splendid *Thistle Cirsium eriophorum*, the profusely flowering (*Eriothera Lanarkii*, the bright yellow *Achillea filipendulina*, the pink *Asclepias speciosa* *Phloxes*, Dahlias and Hollyhocks are of course in place, with Larkspurs, Aconites, and Rockets earlier in the season. For the centre rows *Centaurea atropurpurea*, the scarlet *Monarda didyma*, *Statice* of kinds, *Morina longifolia*, a very striking plant, *Gaura Lindheimeri*, *Epilobium rosmarinifolium*, *Lythrum virgatum*, *Cuphea purpurea*, *Eryngium alpinum* and *E. amethystinum*. Of lower growing things suitable for edging are the grey leaved *Scabiosa Parnassii*, with its pinkish flower-heads, *Prunella grandiflora*, a stately plant, withal of low stature, various species of *Aceana*, *Erigeron mucronatum* (better known as *Vittadinia triloba*), and many others. A visit to the herbaceous ground at Kew, the borders at Chiswick, or the beds in the Botanic Garden in the Regent's Park, will suggest many more subjects. Indeed, a fortnightly, or at longest a monthly visit to a good collection throughout the year, would supply useful hints, and remedy the sterility of flower-beds when the bedding plants are gone.

— Mr. EDWARDS, formerly gardener to Sir JOHN LUBBOCK, High Elms, Kent, is appointed gardener to Earl CADOGAN, Babraham Hall, Cambridge. Mr. EDWARDS is well known as a successful and painstaking gardener.

— The heating apparatus of the Palm House at Kew is undergoing reconstruction, and steps have been taken to prevent in future the very serious inconvenience arising from flooding, which prevailed during so many months last winter and spring.

— The old, we mean the veritable *FUCHSIA COCCINEA*—not what ordinarily goes by the name—is a very slender-stemmed elegant plant, with slim dainty flowers. It was discovered in the Oxford Garden a few years ago, and may now be seen decorating the show house at Kew (No. 4), just one of the plants that ought to be there, for it is very pretty and cannot be bought. In the same house *Fuchsia Venus de Medici*, trained along the rafters, has been in bloom for months, and a beautiful thing it is. Kew is rich in *Fuchsias* just now. The temperate house, always one of the greatest treats to the visitor who loves plants and does not mind a walk to see them, contains just now a beautiful set of these pre-eminently graceful plants.

— The handsome *STOBEEA BERKHEYA PURPUREA*, figured by us, p. 1261, 1872, from the garden of Mr. WILSON SAUNDERS, is now in bloom at Kew. Though a fine and striking plant, it is more ragged and untidy-looking than it was in an apparently neglected corner at Reigate. It is curious to see how different herbaceous plants look in different situations. What is handsome in one place is weedy in another. How splendid the *Gypsophilas* are in some soils, how dishevelled in others.

— We suppose no one but the officials in charge has any but an approximate idea of the richness of Kew. One reason why the botanical public, even,

fail to appreciate the extent of the collections is to be found in the circumstance that the collections are widely scattered over the pleasure-grounds, whose recesses relatively few can find time to explore; and another reason is the confused way in which things of the most varied character are grouped together in the same beds. Surely this might be altered with advantage.

— We have lately met with a case which seems to support the theory of the general DIFFUSION OF THE SAP in plants, including its descent; and, though it is but a repetition of similar cases already noted it may as well be put on record. In the nursery of Mr. G. JACKMAN, of Woking, may be seen two separate lots of the common Ash, worked standard high with buds of the golden variegated Weeping Ash. One lot was worked one year, the other two years ago. In the former we noticed several cases in which the bud had died, and where the growth of the stocks above the point of insertion is this year more or less variegated with the same golden colour as that marking the foliage of the inserted buds. In the other case, we noted on some of the plants where the buds had taken, and produced healthy variegated branches, that variegated shoots had also sprung from the stock, near the ground, and fully 6 feet below the point where the buds were inserted. If this growth was not influenced by the circulation of the sap, to what does it owe its markings? and if these are to be attributed to sap circulation, surely it must have been a downward current which carried the influence so far below the point where the variegated blood was introduced.

— One of the finest of the pale-coloured hardy varieties of CLEMATIS is Otto Fröbel, which is now blooming splendidly with Mr. G. JACKMAN in his nursery at Woking. The plant appears to be remarkable for vigour, and the flowers are of immense size and perfect in form, the sepals being sufficiently broad to be well imbricated. The colour is a French-white, and therefore somewhat wanting in purity, but the fine qualities of the flower in other respects amply atones for this deficiency, and no one who plants it could possibly be disappointed if the plant thrives. It is by no means a novelty, being a continental variety sent out some years since. Another excellent light-coloured variety is Mr. CRIPPS' Lady Caroline Nevill, which is more deeply tinted and barred with mauve-lilac than Otto Fröbel, and not equal to it in size, but it is, nevertheless, a large-flowered sort, and one which can be honestly recommended as a first-class variety, very showy, and very free in producing its attractive blossoms. Star of India is another of Mr. CRIPPS' flowers which is blooming remarkably well this season, and in which the bar of rich Indian-red, almost crimson, is very strikingly effective.

— M. COSSON, an eminent botanist, specially acquainted with the climate and vegetation of Northern Africa, opposes the project of converting the Desert of Sahara into an inland sea. The altered climatal conditions, says he, would be hostile to the Date Palm, the great food plant of the district. The artesian wells would become brackish and the water unfit for irrigation and the support of vegetation, while the general hygienic condition of the country would be deteriorated by the combination of moisture and excessive heat.

— STOKESIA CYANEA, flowering on the rockwork at Kew, is the finest of the Compositæ in flower at this season. It grows 2 feet or more high, and the flower-heads are equal in size to those of Scabiosa caucasica, but deeper in colour. Meconopsis Wallichii still remains in bloom, though long past its best. The rare Arnebia echioides is again blooming, though no larger than last year. Allium pulchellum, with lilac flowers, is one of the prettier of a select few of this genus, which may be grown on any rockwork. Francoa ramosa is much admired, though whether most for its pretty spikes of pink flowers or its broad foliage it is difficult to say. Neja gracilis is an extremely pretty and tiny shrub; its branches are very slender, bearing hairy yellow leaves, and comparatively large, bright, willow flower-heads. The origin of the name of this plant, which we were told by one who was an eye witness of the incident, is curious. Professor Don, after puzzling his brains for some time and without success to find an appropriate name, at last determined to inscribe certain letters on slips of

paper, and to draw these one by one till some euphonious combination occurred. The letters n, e, j, a, were thus drawn out in succession, and Neja was the name adopted.

— Amongst other things disposed of by Mr. STEVENS at the recent sale at the Royal Vineyard Nursery, Hammersmith, was a cast-iron saddle boiler of peculiar construction which had been in use there for forty-two years, and which Mr. CHARLES LEE stated was the best boiler that the firm had ever had. It was designed by Mr. THOMSON, late of the Penge Nursery, who also fixed similar boilers in 1839 in the nursery which he started in that year at Hammersmith, and which afterwards passed into the hands of Mr. MACINTOSH, which boilers we are assured were in good working order a few years ago. It was purchased by its inventor, Mr. THOMSON.

— By way of contributing to the information already possessed as to naturalising plants of a generally accepted exotic character, it may be remarked that the two plants of TRACHELOSPERMUM JASMINOIDES Mr. PETTIGREW, of Cardiff Castle Gardens, planted against the south-east wall of his cottage, have done remarkably well without having had any covering during the past two winters. The plants have put forth vigorous leading shoots, and are now blooming freely. The position is a sheltered one, but it is rather moist, and, being in the borough of Cardiff, is sometimes surrounded with atmospheric conditions not of the most favourable character. At Llanrhymney Hall, near Cardiff, the residence of GEORGE WILLIAMS, Esq., there can be seen growing against the front of the mansion a plant of Clianthus puniceus which is supposed to be ten to twelve years old. It covers a space of wall 12 to 14 feet in height and 20 feet in width. It flowers very freely during the proper season, and is an object of considerable beauty when it is dressed in its richest floral garb.

— PHYGELIUS CAPENSIS is flowering in great beauty on the wall of the Orchid House at Kew, and, though quite hardy, it reaches in this position a more perfect development than in the open. It has the aspect of PENTSTEMON, and the panicles of scarlet flowers are 2 feet in height.

— Some pillar-trained plants of the CLEMATIS JACKMANI, growing in the London Road Nursery of the Messrs. Sutton, at Reading, finely illustrate the value of these hardy climbers for shrubby decoration. They are not tied in with stiff and formal gait, but grow somewhat loosely and form almost pyramids of foliage and flower. The hardy and robust dark kinds are specially suited for this mode of culture. At the same place a most charming effect is produced by the combination in lines of the deep blue Delphinium formosum, and the bright pale blue variety, Belladonna. The first head of bloom produces the seed crop, which is harvested, and this is succeeded by a continuity of flower that lasts late into the autumn.

— At the recent horticultural exhibition at Weston-super-Mare, CAMPANULA MACROSTYLA was a conspicuous object on a stand of miscellaneous cut flowers, shown by Mr. STEPHEN BROWN, nurseryman, Weston-super-Mare. It is a species from Asia Minor, an annual, and it bears large, erect, cup-like flowers, of a pale ground colour, handsomely reticulated with purple. The blooms are of unusual size for a Campanula. At the same exhibition Mr. BROWN had excellent specimens of Petunias in pots, well-grown and freely-flowered, and of a handsome bushy habit of growth. The varieties were in keeping with the excellent character of the plants, which were pretty well all that could be desired as exhibition specimens.

— The bedding display—the carpet bedding especially—at VICTORIA PARK, is well worth a visit at the present time. Quite a new phase has been entered upon. The groundwork of the majority of the beds consists of two dense growing dwarf green plants—Herniaria glabra, which is Mr. MCINTIRE's favourite, and Mentha Gibraltarica. Within these all the more delicate figures are wrought out with excellent effect. This step will go far to clear this style of bedding from the reproach of over gaudiness. The chief bedding-plants employed, or what are considered best this season, are, Pelargoniums, Waltham seed-

ling—a monument to the memory of DONALD BEATON; Cleopatra, a splendid pink; Nimrod and Vesuvius, rare scarlets; Lucius, Crystal Palace, Princess Alexandra, &c.; and the parti-coloured or salmon, Madame Rudersdorff, for soft or various coloured—the latter bring here masses of bloom.

THE EDGE END NURSERY, NEAR BURNLEY.

THIS nursery which has under the management of Mr. Henry Walton so long been famed for its collections of hard-wooded plants, is at the present time so replete with this class of plants, and withal in such health and vigour that perhaps a short notice of the result of a visit a few days ago may be of sufficient interest to find a place in your pages. Brierfield, the nearest station to the nurseries, lies in a north-easterly direction from Burnley, and is easily reached on the Lancashire and Yorkshire Railway, trains passing through very frequently during the day. To all such as purpose making additions to their collections of Camellias, Azaleas, Ericas, specimen stove plants, &c., I should strongly advise a journey here, feeling sure they will meet with many plants of a very desirable nature. In company with the worthy proprietor we were conducted through the houses, and certainly the satisfaction with which he pointed out and referred to many of the plants cannot be considered as more than natural, considering that for nearly thirty-six years he has laboured and devoted his energies to the establishment of the place as now seen, and many a time taxed mind and brain for the furtherance of objects dear to him for their own worth, in that they pertained to horticulture, as well also as from the fact that through them a business connection must be made, and sustained with credit to himself and satisfaction to his clients.

In a span-roof house devoted to the culture of Heaths, &c., we met with fine examples of E. Victoria Regina, Marnockiana, æmula, Lindleyana, Shannoni, and Shannoni glabra, ampullacea, obbata, Kingscottiana, &c., all very vigorous and free, and many densely flowered. Here also we saw the new E. opulenta in flower, and it is truly one that will make its mark, among this beautiful and interesting class of plants. The flowers are of a bright crimson lake, and are produced in immense terminal whorls of from ten to fifteen blooms each. Here too was E. tricolor profusa, a very desirable variety, and efusa, the flowers of which are of a bright crimson scarlet, appearing in whorls of from ten to twelve. Of Lowii we observed a number of plants coming on very nicely, whilst in another house was a fine lot of smaller plants of all the sorts, coming on to take the place of the larger ones as they are sent away. Passing through two other houses devoted to greenhouse plants, we observed a capital lot of such things as Boronias, bouvardias, Daphnes; as well also as a quantity of choice flowering Rhododendrons, among which are to be found Veitchianum, Princess Royal, Princess Alice, retusum, Countess of Derby, Countess of Sefton, &c.

Near to these houses were several devoted to miscellaneous subjects, propagating, grafting, &c., all filled with plants in various stages of growth. Leaving these we pass into the flowering stove where are many large plants such as Allamandas, Dipladenias, Clerodendrons, Bougainvilleas, whilst on the side stages was a quantity of the new Crotons, Dracænas, Aralia Veitchii, gracillima, &c.

In a large house devoted chiefly to fine foliage plants, we noticed some fine specimens of Crantons—pictus, most superbly coloured, variegatus and angustifolius, each being about 5 feet high and 4 to 5 feet through. Cycas revoluta was a grand plant, having from eighty to ninety of its strong dark green and shining fronds. Eucephalartos Lehmanni, Cycas pubescens, Dion edule, Cocos Weddelliana, Geonoma gracilis were also represented by fine and vigorous specimens. The Fern houses were filled with good useful plants, among which we noticed the new Sadleria cyathoides, fine plants of Todea superba, and Wilkesiana, Hymenophyllum demissum, and Davallia Tyermannii.

The houses devoted to Orchids, which are not so numerous now as they have been in years past, nevertheless contain many good plants deserving mention. Miltonia spectabilis is very strong and full of flower, represented by several fine plants; Lælia elegans, Cattleya Warneri, Trianea, Cyripedium caudatum,

Oncidium Marshallianum, Cypripedium Veitchii, &c., were all very strong and in robust health. Several houses next followed in which Camellias exclusively are grown, and here are to be seen such a collection of home-worked plants, and specimens from 6 inches high to specimens of 8 to 10 feet high, that few can rival or excel. The health and vigour of the whole of them, the uniform dark green, shining leaves indicate at once that here at least the culture of Camellias is understood, and the increase of good sorts is in like manner well under control. Fancy a house 110 feet long by 24 wide, with a bed running nearly the whole of the length 12 feet wide, filled with plants from 3 feet to 5 feet high, and bushy in proportion, whilst towering over these are tall specimens of *Seaforthia elegans*, *Dicksonia squarrosa* and *antarctica*, *Asphodela australis*, &c.; and the front stage filled with a choice collection of *Agaves*, such as *regale*, *univittata*, *filifera*, *applanata*, *schidigera*, *Seemanii*, *Verschaffeltii*, *Yucca filamentosa variegata*, *aloifolia*, *variegata*, *quadricolor*, *Beaucarnea glauca*, having long narrow leaves, &c.; and some idea will be obtained of the quantity and richness of the nursery in respect to saleable plants of this class. A thousand plants of double white *Camellia* will convey an idea of the high esteem in which this old variety is still held, whilst the fact that 170 varieties are grown will pretty clearly indicate that every new variety as it appears is obtained and quickly worked up.

Of the varieties of *Azalea indica* the same remarks would apply, several houses being devoted to them, and any new variety, when once proved to be of real worth, is worked up and increased with a rapidity that only those can understand who are dependent on a full and early supply for liberal support, and customers who are anxious for the possession of plants that are thoroughly good, and can be supplied with such as early as possible. Here were numbers of the new ones, such as *Madame Corsi*, *Imbricata*, *Triomphe des Double Blancs*, *John Gould Veitch*, *Marshal MacMahon*, &c., that were coming nately on, whilst older sorts were also well represented. A number of good plants of *Dracæna indivisa*, in an *Azalea* house raised on pots, were very effective, and several fine plants, too, of *Lapageria alba* were in very robust health. The seldom seen *Philesia buxifolia* was here in flower. A fine plant of *Phormium tenax variegata* had been in bloom, the spike being 10 feet high, was bearing several seed pods. A large span-roof house was filled with pot Vines, the new sorts being well represented; but nothing at present is found to supplant the old *Black Hamburg* and *Muscat of Alexandria*, and these have the lead in this department. Though our notes were taken during a fearful storm of thunder and lightning, and as opportunity offered we had to run from one house to another, many pleasant recollections however remain of the kindness and pleasant intercourse with Mr. Walton, and should any of your numerous readers pay him a visit it is to be hoped that the elements may be more propitious, and that their minds and thoughts may be directed to the plants about them, and that they may not labour under such great meteorological disadvantages. W. S.

THE CULFORD GRAPE VINE SPORT.

THIS sport has already been so freely discussed, some time since, in your own columns, as well as in those of the *Journal of Horticulture*, the *Gardener*, and possibly other gardening periodicals, that it may be considered that enough has already been written about it; and I certainly should not have ventured to re-introduce the subject, were it not on account of the circumstance of the bunch of Grapes in question having been non-existent during the time when discussions about it were taking place; and the only evidence of its having existed was to be found in the assertions of a few of those who had seen it. It will be recollected that great doubts were entertained, as to the correctness of these statements, by some writers upon the subject, who had not, however, seen the bunch in question themselves.

I have now only to state that at the present time a bunch is borne upon the same Vine and upon the same spur, which appears to be in all respects similar to that which was produced during the year 1874, so that any one interested in the matter may now see and examine it. It may, perhaps, be in the recollection of some of your readers that I stated in your

columns that I had sent eyes from a shoot produced from the same spur, during the following season, to Mr. W. Thomson, of the Tweed Vineyard, at Clovenford; and I think that he has stated that he succeeded in striking them, so that it is possible that some of the plants so raised may now be bearing fruit, and, if so, it will be very interesting to know if the fruit differs in any degree from the true *Trebbiano* type. No doubt Mr. Thomson will kindly furnish this information. It will be distinctly understood that the shoot from which Mr. Thomson had eyes here no fruit, but was produced by the same spur which had produced the shoot which bore the remarkable bunch during the former season. As regards the bunch of the present season I may state that the berries composing it are now (August 14) at least twice the size of the berries of the *Trebbiano* variety growing upon the same rod; and the fruit of the former appears to be

Grape Vine, viz., Mrs. Pince's *Black Muscat*, *Trebbiano*, and *Golden Champion*; and during several years the three sorts continued to grow and to produce their respective fruit.

It was in the course of time, however, considered desirable to have only late or long-keeping kinds in this house; and as the *Golden Champion* was not found to be a long keeper here, at least, it was cut out altogether, at a point some few inches below its junction with the *Alicante*, on which it had been inarched. This, I think, was done during the month of January, 1874; and during that season the two remaining rods bore their respective fruits as usual, with this exception, viz., the *Trebbiano* rod, near its centre, produced a bunch distinct from all the other bunches upon the same rod, and so wonderfully like the fruit of the well-known *Golden Champion*, that no one who saw, handled, and tasted it could perceive the least difference between the two. This bunch of Grapes was produced at the eod of the shoot, and the wood buds between the rod and the bunch were inserted as eyes in the usual way, but from some cause they failed to grow; and during the two succeeding seasons, viz., 1875 and 1876, although shoots were produced from the spur, they nevertheless failed to show fruit. It is somewhat strange that the appearance of this sport should have been regarded with so much suspicion as it was. Sports, it is well known, have occurred on more than one or two occasions in various sections or families of the vegetable kingdom, and the cause or causes which have produced them are just as obscure as is that which has produced the sport in question.

It may not unnaturally be supposed that the circumstance of the *Golden Champion* variety having for some time grown upon the same stock, may have in some way influenced the *Trebbiano* rod, so as to produce the result which has been described. But should this be admitted, it will hardly, I fear, accord with Mr. Murray's doctrine of the non-descent of the sap, as it will be seen that only by the action of a descending current through the stock, could a communication exist between the rods. P. Grieve, Culford Gardens, Bury St. Edmunds.

Home Correspondence.

Self-sown Seedling Potatoes.—Believing it will be of interest to your general readers, and to Potato fanciers in particular, we beg to submit the following facts, it being the only instance of self-sown seedling Potatoes that has come under our notice. On the shore of Cara Lake, which is 17 miles due west of Killarney, and three miles from Dingle Bay, on the Atlantic, is a farm of more than local repute, owned by J. B. Kennedy, Esq., an enthusiast in the Potato line, not so much a propagator of new varieties as a producer of seed stocks of unrivalled purity. Here it is that Nature, with truly liberal hand, has given an unlooked for growth of many thousands of seedling Potatoes. Perhaps it will be quite time enough to talk of pedigree when the discerning eye of the scientific proprietor has minimised his present brood down to a dozen or so of promising varieties; but just to show that there is reason to be sanguine of some real acquisition, it might be well to mention that the parent plums dropped off as fine a crop of Paterson's *Victoria* as ever graced a farm, and lay buried all winter in the field, which is a friable peaty loam. Possibly some of your many readers and able correspondents may have heard of similar spontaneous production, and will communicate the fact through your columns, or favour Mr. Kennedy with their opinion of the above. McKenzie & Sons, Cork.

Larch Injured by Autumn Frosts.—I enclose twigs of Larches, shewing the effects of August frost; the top buds are not killed, but all the side shoots are similar to those sent. There was frost during several nights last week. I am now upwards of sixty years old, and never knew Larches cut in August; most certainly seasons are changing. Forty years ago Peaches and Nectarines were ripened on walls without difficulty, but for some years the crop has been most uncertain. John Carter, Keighley.

The Spiral Twist.—On reading the article in your paper of January 13, relative to the misunderstandings which sometimes occur in describing the growth of climbing plants, through using the terms "right and left,"—as these terms apparently vary according to the position the person using them is standing, I thought it would be better to drop those terms which may be misunderstood, and adopt those which cannot, look at them as you may, vary in the slightest degree, viz., east, west, north, and south,

FIG. 46.

A, Stem of West's St. Peter's Vine; B, Showing where it was grafted with *Black Alicante*; C, Showing height of front wall; D, E, The *Black Alicante* stem grafted at the point F with G, *Trebbiano*; H, *Golden Champion* (removed); I, Mrs. Pince's *Black Muscat*; K, Indicates the position on the *Trebbiano* rod where the bunch of *Golden Champion* was produced.

rapidly approaching a ripe condition, which is very far from being the case as regards the latter.

For the benefit of those of your readers who may not have read the correspondence which took place upon this subject, or who having read it may now have forgotten all about it, I will, with your permission, as briefly as possible, recapitulate the circumstances of the case, which are as follows:—Some twenty-five years ago a house here was planted with a variety of the Grape Vine known as "West's St. Peter's," at that time considered one of the best late keeping kinds; and some six or seven years afterwards the Vine in question was cut down and grafted with the *Black Alicante*; and some few years afterwards three distinct shoots of the *Alicante* had inarched upon them three distinct varieties of the

which I would propose to use in the following manner:—We all know that all climbing plants which need description as to method of growth must climb round something; let that something be called its centre. Well, that centre, look at it as you will, stand where you like, must have a north and a south side to it, and the plant climbing round that centre must, on passing, say its south side, be pointing either east or west. Would it not, therefore, be easily understood if botanists, in describing the growth of a climbing plant, were to say that on its south centre it grew east or west? *Australian.*

Five Crops of Melons from the same Plant in One Year.—Some years ago Mr. Wildsmith sent a communication to the *Gardeners' Chronicle*, stating that he had taken three crops of Melons from the same plants in one season, and, notwithstanding that communications of Mr. Wildsmith's are at all times worthy of serious and respectful consideration, the results stated to have been achieved in his communication respecting the Melons were at the time received very dubiously by some of your readers, perhaps myself included. But if I ever had any doubt upon the matter, my own experience this year has completely obliterated them, and hence my excuse for troubling you with these few notes, trusting, however, that they may not be without interest to a few of your many amateur readers, who, perhaps, for the want of more glass accommodation cannot grow so many of these deliciously cooling summer fruits as they would wish to do. The seeds of the Melons (Longford Green-flesh) were sown on January 18 last, and were planted in a hot-water pit on the 10th of the following month, from which plants we commenced cutting the first week in May, and have continued doing so since, I might almost say without intermission. One of the fruits of the second crop weighed 10 lb.—the ordinary size being from 3 to 6 lb. each. Having finished the first crop (of course we had and have still successional pits coming on), I was led—through the healthy appearance of the foliage—to examine the plants, when, not to my surprise, I found a most beautiful and equal set of fruit. I, therefore, set to and thinned the shoots out a little, cutting out all the old I possibly could, picking off any shabby leaves that were on the plants, and broke the surface of the bed a little; this done, and having left four fruits (sixteen) to each light, the bed received a couple of tubs of clear water, after which it immediately received one or two tubs of liquid manure. Thus treated after the perfecting of each crop, with the usual stopping and syringing twice a day on bright days, they have ripened their first and second, third and fourth crops, and are now finishing their fifth crop of fruit varying from 4 lb. to 8 or 9 lb. each, and, judging from their present appearance, they will ripen two or three more crops, for not only is the foliage healthy and gross, but there is another nice crop of fruit set, and swelling off nicely. Several gardeners have seen them, and, on being told how long they were in bearing, expressed their surprise at the satisfactory results, and the healthiness of the plants. Your readers will understand that I do not advance the above as any achievement of mine, nor anything new, but simply to corroborate a statement made some seven years ago, which I have alluded to was then received—if received at all—with considerable doubt, and partly to interest and perhaps benefit some of your uninitiated readers. *H. W. Ward, Longford Castle, Aug. 14.*

Feathery Columbine (see p. 187).—There is no doubt that the plant inquired for is *Thalictrum aquilegifolium*, an old garden favourite, which is still to be met with frequently enough in old-fashioned country gardens, where it is usually known as Feathered Columbine. Its very elegant foliage renders it a useful plant for bouquets. The flowers are usually cream-coloured, but French writers (who call it *Colombine plumée*, or *Columbine plumacée*) mention a variety with lilac-rose-coloured, and another with lilac-purple blossoms. This latter is probably the variety *formosum*, which was figured in the *Botanical Magazine*, t. 2025; the commoner form is given at t. 1818 of the same work. It is a native of Southern and Central Europe, extending to Siberia, and has been in cultivation in this country since 1731. *B. M.*

The Colorado Beetle.—There has been so much said and so much anxiety felt respecting the above beetle that I thought a few lines from one who has battled with them for three years would not come amiss. We have only had them for the above period in the Eastern States, but they have had them in the Western States for some eight years or more. They originated in Colorado, thereby taking its name. They attack not only potatoes but tomatoes and egg plants, which all belong to the genus *Solanum*. In Long Island last year many market gardeners lost their entire crop of tomatoes by their ravages. But we think no more of their depredations, as we have an effectual remedy in Paris green, which we make into a solution—one tablespoonful to a pail of water—keep-

ing it stirred, as it does not dissolve, and sprinkling the vines over by means of a "whisp broom," or syringe, the former being preferable, as the solution goes farther. Three or four doses will secure your crop. I would sooner contend with the beetles than with the potato blight you have here. Last year we lost our crops, but this by using Paris green we expect to get as good a crop as we ever had. A good many people would not use it, as they were afraid of it. A man coming from New York to Poughkeepsie last year on one of the Hudson River steamers died on the way, and the report spread that he died from eating Potatoes that Paris green had been used upon. They held a *post mortem* examination upon him, but found no trace of poison, as he died from a different complaint, and many others were reported, which, of course, were false. It cannot poison the Potatoes, neither does it hurt the foliage if it is applied as stated above. I knew a man last year who thought he could keep the beetles down by hand-picking; but they got the best of him. But he was like a good many more—he was afraid of the remedy. So he made a kind of trough and dragged it through the drills, beating the haulms to get the beetles into the trough. It did not take long to get it full. When full he would empty it and set them on fire with kerosene oil. They cannot fly in the morning or in the evening, but do as soon as the sun gets hot; the hotter it is the better they like it. Try the above receipt as soon as you get them, if get them you do, but I hope you will not. *W. G. Saltford, Islington Gardens, Puddletown, Dorchester, Aug. 14.*

The Stamfordian Tomato.—This variety was sent out by Messrs. James Dickson & Sons, Chester, last spring, under the name of Jackson's Favourite Tomato. *F. Jackson, Braxted Park, Witham, Essex.*

Hale's Early Peach.—Seeing in your last week's report of the Royal Horticultural Society's Fruit Committee meeting (see p. 181) that this excellent Peach received a First-class Certificate, I am induced to mention that I gathered three ripe fruits, on August 7, from a tree on the open walls. In 1874 I gathered from the same tree on July 7. I consider it in every respect equal to Royal George, with the advantage of being much earlier. This season, in an early Peach-house, side by side, and under precisely the same conditions, I gathered Hale's Early three weeks sooner than that variety. *John Austen, Ashton Court Gardens, Bristol, Aug. 14.*

Butcher's Broom (*Ruscus aculeatus*).—This plant is used for a variety of purposes, both in this country and on the Continent. The tender shoots which the roots send out in spring are often sought for by the poor, who boil them instead of Asparagus, a plant they, at that particular stage of growth, somewhat resemble. The roots are sweet to the taste at first, and afterwards bitter. They were once used largely in medicine, and are still considered in many local districts to possess powerful aperient qualities, combined with other virtues which render them valuable, as your correspondent, Mr. T. Smith, observes, in cases of dropsy. Many of our old foreign doctors speak of the Butcher's Broom as an unfailing remedy in this disease, and some extol the powdered root as anti-scorbutic. The scarlet seeds were at one time used as a substitute for coffee, but their medicinal properties led to a discontinuance of their general use. For dropsical persons they are still often recommended by "village quacks" and "old women." By the way, I have often noticed that some of these "old women" have been successful with herbs and plants in cases where the educated qualified practitioner has failed to effect a cure; so I am disposed to believe in "simples," "the doctrine of signatures," and many other nearly exploded notions. The ancient name for this plant was *Bruscus*, derived, it is said, from "brus," Box, and "kelm," which is Celtic for Holly. Virgil refers to it most distinctly as the Box Holly (I am told) in both his eclogues of Georgics. It obtained the name of Butcher's Broom in the following unromantic fashion. These "prosperous gentlemen" were wont to use its branches to sweep their blocks with. The Italians turn them to better service; they make exceedingly pretty beehives with them; but I like the branches best when they have their ripe fruit on, then they form a welcome member of certain winter nosegays, wherein various berries play a prominent part. *Helen Watney, Liss.*

Rendle's Patent Hot-houses.—Last season I had a house re-roofed on Rendle's system. It is a well-known fact that the most important things in Grape-growing are light, ventilation, and, above all, a water-tight structure, and Rendle's houses in an eminent degree combine all. The Vines are 17 inches from the glass, and we began forcing in January. Although for nine years past I have always been fortunate in securing a full and profitable crop of Grapes, this year the crop is heavy, and very much superior to what they have ever been before—berries large and finely coloured. I send you a bunch for

opinion. I am very much impressed with this system of growing, and although it is one sheet of glass not one leaf has been scorched. *R. Gilbert.*

The Floral Committee's Votes of Thanks.—I could wish that some member of this committee would enlighten the public as to the principle which influences that body in the formal awarding of votes of thanks to exhibitors of subjects before it at the South Kensington meetings. I should imagine that all who assisted to make those meetings interesting were equally deserving of thanks. At the last meeting I noticed that a member of the committee received a special vote of thanks for three pieces of cut flower, whilst collections of plants and cut flowers from others received no such award. *X.*

Orchids in July.—I venture to send you the following list of Orchids, which have been in flower in my collection during the month of July:—

<i>Acerides odoratum</i> (two varieties)	<i>Epidendrum macrochilum</i>
" <i>japonicum</i>	" <i>atropurp.</i>
" <i>roseum</i>	" <i>vitellinum majus</i>
<i>Angulica Clowesii</i>	" ? A little thing whose genus and species I have not identified
" <i>Ruckeri</i>	
<i>Arundina</i> (? <i>affinis</i>)	<i>Huntleya cerina</i>
<i>Brassavola nodosa</i>	<i>Lælia purpurata</i>
<i>Broughtonia sanguinea</i>	<i>Lycaste aromatica</i>
<i>Cattleya Aclandiae</i>	<i>Massevallia Veitchiana</i>
" <i>Mossii</i> (two varieties)	" <i>Harryana purpurea</i>
" <i>superba</i>	" <i>ochthodes</i>
" <i>splendida</i>	" <i>coriacea</i>
<i>Celogyne corrugata</i>	<i>Maxillaria graminea</i>
<i>Cymbidium alofolium</i>	" <i>rufescens</i>
<i>Cypripedium barbatum</i>	" ?
" <i>niveum</i>	<i>Mesospidium sanguineum</i>
<i>Dendrobium transparens</i>	<i>Miltonia flavescens</i>
" <i>Devonianum</i> (several varieties)	" <i>Regnellii</i>
" <i>tortile</i>	<i>Odontoglossum Lindleyanum</i>
" <i>moschatum</i>	" <i>nebulosum</i>
" <i>calceolus</i> (if this and the preceding are not distinct species, they are strongly marked varieties)	" <i>Schlieperianum</i>
" <i>dixanthum</i>	" <i>Rossii</i>
" <i>Parisii</i> (two varieties)	" <i>veixillarium</i>
" <i>nodatum</i>	<i>Oncidium cucullatum</i>
" <i>crystallinum</i>	" <i>exasperatum</i>
" <i>aduncum</i> (two varieties)	" <i>Kramerianum</i>
" <i>amcnum</i>	" <i>altissimum</i>
" <i>roseum</i>	" <i>varicosum, Rogersii</i>
" <i>chrysanthum</i>	" <i>hastatum</i> (two varieties)
" <i>chloros</i>	" <i>obryzatum</i> (two varieties)
" <i>suavissimum</i>	" <i>serotum</i>
" <i>tridentium</i>	" <i>flexuosum</i>
" <i>Bensonae</i>	<i>Phalænopsis grandiflora</i>
" <i>chrysoxum</i>	" <i>Luddemanniana</i>
" <i>crimenatum</i>	" <i>Wightii</i>
<i>Dendrochilum filiforme</i>	<i>Promeneza stapelioides</i>
<i>Epidendrum ambiguum</i>	<i>Saccolabium ampullaceum</i>
" <i>crassifolium</i>	" (two varieties)
" <i>cochleatum</i> (two varieties)	" <i>curvifolium</i>
	<i>Sobralia macrantha</i>
	<i>Stanhopea tigrina</i>
	<i>Triochilia tortilis</i>
	<i>Vanda Roxburghii</i>

P. H. Gosse, Sandhurst, Torquay.

A Golden Variegated Dahlia.—Do you know of a golden variegated Dahlia? One of our men was out the other day and saw it. The party that has it can't account for its variegation. It is from 4 to 5 feet high, and is a beautiful object. *E. W. [Yes; there is one; but it is not common. Eds.]*

THE BRITISH ASSOCIATION.

The address of the President, Dr. Allen Thomson, of Glasgow, to the meeting of the Association at Plymouth, was mainly devoted to the question of the development of existing creatures from simpler ancestors. Dr. Thomson, in the course of his discourse, pointed out how the doctrine of spontaneous generation received but little support now-a-days, the general belief being in the origin of all organised beings from pre-existing germs; as to the original germ or germs nothing is definitely known. Before proceeding with the discussion of this special subject, he called attention to the remarkable change in the manner of viewing biological questions which has taken place in this country during the last half-century.

FIXITY OF SPECIES.

In the three earlier decades of this century it was the common belief, in this country at least, shared by men of science as well as by the larger body of persons who had given no special attention to the subject, that the various forms of plants and animals recognised by naturalists in their systematic arrangements of genera and species were permanently fixed and unalterable, that they were not subject to greater changes than might occur as occasional variations, and that such was the tendency to the maintenance of uniformity in their specific characters that, when varieties did arise, there was a natural disposition to the return, in the course of succeeding generations, to the fixed form and nature supposed to belong to the parental stock; and it was also a necessary part of this view of the permanency of species that each was considered to have been originally produced from an individual having the exact form which

its descendants ever afterwards retained. To this scientific dogma was further added the quasi-religious view that in the exercise of infinite wisdom and goodness, the Creator, when He called the successive species of plants and animals into existence, conferred upon each precisely the organisation and the properties adapting it best for the kind of life for which it was designed in the general scheme of creation.

VARIABILITY OF SPECIES.

How different is the position of matters in this respect in our day!—when the cautious naturalist receives and adopts with the greatest reserve the statement of fixed and permanent specific characters as belonging to the different forms of organised beings, and is fully persuaded of the constant tendency to variation which all species show even in the present condition of the earth, and of the still greater liability to change which must have existed in the earlier period of its formation—when the belief prevails that, so far from being the direct product of distinct acts of creation, the various forms of plants and animals have been gradually evolved in a slow gradation of increasing complexity—and when it is recognised by a large majority of naturalists that the explanation of this wonderful relation of connection between previously existing and later forms is to be found in the constant tendency to variation during development and growth, and the perpetuation of such variations by hereditary transmission through successive generations in the long but incalculable lapse of the earth's natural mutations. These were in their essential features the views now known as Darwinism, which were first simultaneously brought forward by Wallace and Darwin in 1858, and which, after being more fully elaborated in the works of the latter, and ably supported by the former, secured, in the incredibly short space of ten or twelve years, the general approval of a large portion of the scientific world.

ANCESTRY OF LIVING BEINGS.

It was now familiarly known that almost all (if not, indeed, all) the plants and animals existing on the earth's surface derived their origin from parents or previously existing beings, whose form and nature they closely reproduced in their life's history. By far the greater number sprang from germs in the form of visible and known spores, seeds, or eggs; a few might be traced to germs, or to vestiges of the parental body, the exact nature of which might be doubtful; and some, including even a certain number of those also produced from known germs, were either constantly or occasionally multiplied by budding, or by a process of cleavage or direct and visible division of the parent body. The germ constituting the basis of new formation, whether it had the form of spore, seed, or ovum, was of the simplest kind of organisation, and the process by which a new plant or animal was produced was necessarily one of gradual change, and of advance from a simpler to a more complex form and structure—it was one of "evolution," or, as he would rather name it, "development."

PRACTICAL APPLICATIONS.

The practical applications of the increased knowledge of the origin of minute animal and vegetable organisms were so numerous that it would occupy a much longer time than was at his disposal to give any detailed account of them; but they were of such immense importance in their commercial, social, and sanitary relations that they ought never to be lost sight of. It was now proved beyond doubt that the origin of putrefaction and fermentation was dependent on the presence in these substances which were the seat of change in these processes, or in the surrounding air, of the germs of minute organisms of an animal or vegetable nature, and that the maintenance of the chemical changes in which these processes mainly consist was coincident with and casually (if not essentially) dependent upon the growth and multiplication of these organisms. Professor Lister had the merit of being the first to apply the germ theory of putrefaction to explain the formation of putrid matters in the living body; and he had founded on this theory the well-known antiseptic treatment of wounds, the importance of which it would be difficult to over estimate. The success or failure of plans for the preservation of meat and other articles of food without question depended on the possibility of the complete exclusion of the germs which are the cause of putrefaction and fermentation; and their management must therefore be founded on the most accurate knowledge of these organisms, and the circumstances influencing the persistence of their vitality and the vigour of their growth. The theory of biogenesis had also lately been the guide in the investigation of the causes of various forms of disease, both in the lower animals and in man, with the result of showing that in many of them the infective substance consists, in all probability, of germs of minute animal or vegetable organisms. There was very great probability, indeed, that all the zymotic diseases had a similar origin.

DEVELOPMENT OF PLANTS.

Turning now to the mode of development of a new being in those belonging to the higher groups, in the

higher or phanerogamic plants the combination of two parts of the flower was necessary to the production of a seed containing the embryo or young plant. The careful and minute investigation of a long line of illustrious vegetable physiologists had brought to light the details of the process by which fertilisation is effected. The essential part of the process of production in phanerogamic plants was the formation in the parent plant of cells of two different kinds, which by themselves had little or no independent power of further growth, but which, by their union, gave rise to a product in which the power of development was raised to the highest degree. By further researches it was known that the same law prevailed in all the remaining members of the vegetable kingdom, with the exception only of the very simplest forms. In viewing the reproductive process in the series of cryptogamic plants, the difference between the two productive elements became more prominent, or more highly specialised, in the cryptogamic than in the phanerogamic plants; and in the simpler and lower forms this difference gradually disappeared till it was lost in complete uniformity of the productive elements. The germinal element consisted of a simple primordial cell, varying in different kinds of plants, but in all of them probably containing the essential substance protoplasm; and the most immediate result or effect of fertilisation was the multiplication, by repeated fissiparous division (or splitting) of the previously existing cells. The new individual resulting from this cellular growth usually remained within the parent body, without, however, direct union or continuity of tissue, till the embryo had attained some advancement, as in the well-known case of the seeds of a phanerogam; but there were many varieties in the mode of its disposal among the lower plants. In the statement which he had made of some of the more remarkable phenomena of organic production it had been his object mainly to show that they were all more or less closely related together by a chain of similarity of a very marked and unmistakable character; that in their simplest forms they were indeed, in so far as our powers of observation enabled us to know them, identical; that in the lower grades of animal and vegetable life they were so similar as to pass by insensible gradations into each other; and that in the higher forms, while they diverged most widely in some of their aspects in the bodies belonging to the two great kingdoms of organic nature, and in the larger groups distinguishable within each of them, yet it was still possible, from the fundamental similarity of the phenomena, to trace in the transitional forms of all their varieties one great general plan of organisation. In its simplest and earliest form that plan comprised a minute mass of common nitrogenous hydrocarbon compound to which the name of protoplasm had been given, exhibiting the vital properties of assimilation, reproduction, and irritability. The second stage in this plan was the nucleated and enclosed condition of the protoplasmic mass in the organised cell. They next recognised the differentiation of two productive elements, and their combination for the formation of a more highly endowed organising element in the embryonic germ-sphere or cell; and the fourth stage of advance in the complexity of the organising phenomena was in the multiplication of the fertilised embryo-cell and its conversion into continuous organised strata, by further histological changes in which the morphological foundations of the future embryo or new being were laid. The formative or organising property therefore resided in the living substance of every organised cell and in each of its component molecules, and was a necessary part of the physical and chemical constitution of the organising elements in the conditions of life; and it scarcely needed to be said that these conditions might be as varied as the countless numbers of the molecules which composed the smallest particles of their substance. But, setting aside all speculation, it appeared to him that no one could have engaged in the study of embryological development for any time without becoming convinced that the phenomena which had been ascertained as to the first origin and formation of textures and organs in any individual animal were of so uniform a character as to indicate a law of connection and continuity between them; nor would his study of the phenomena of development in different animals have gone far before he was equally strongly convinced of the similarity of plan in the development of the larger groups, and, to some extent, of the whole. He considered it impossible, therefore, for any one to be a faithful student of embryology in the present state of science without at the same time becoming an evolutionist. There might still be many difficulties, some inconsistencies, and much to learn, and there might remain beyond much which we should never know; but he could not conceive any doctrine professing to bring the phenomena of embryonic development within a general law which was not, like the theory of Darwin, consistent with their fundamental identity, their endless variability, their subjugation to varying external influences and conditions, and, with the possibility of the transmission of the vital conditions and properties, with all their variations, from individual to individual, and, in the long lapse of ages, from race to

race. He regarded it, therefore, as no exaggerated representation of the present state of our knowledge to say that the ontogenetic development of the individual in the higher animals repeated in its more general character, and in many of its specific phenomena, the phylogenetic development of the race.

If they admitted the progressive nature of the changes of development, their similarity in different groups, and their common characters in all animals, ray, even in some respects in both plants and animals, they could scarcely refuse to recognise the possibility of continuous derivation in the history of their origin; and however far they might be, by reason of the imperfection of their knowledge from realising the precise nature of the chain of connection by which the actual descent has taken place, still there could be little doubt remaining in the minds of any unprejudiced student of embryology that it was only by the employment of such an hypothesis as that of evolution that further investigation in these several departments would be promoted, so as to bring us to a fuller comprehension of the most general law which regulates the adaptation of structure to function in the universe.

Reports of Societies.

Olney Horticultural: Aug. 4.—That the people of Olney and the dwellers in the adjacent villages should look upon this annual exhibition with favour, is not to be wondered at, for it is the occasion of an annual holiday, and the usually quiet village becomes quite lively with an influx of visitors on the show day. The show in itself was small, but yet very attractive for the district; and amateurs, understanding by this persons who do not employ a gardener, and cottagers vic with each other in competition for the prizes, and stage some remarkably good things. Potatoes are quite a feature, and there is always a keen competition among the amateur cultivators. The sorts are generally good, and some of the samples would take good positions at the exhibition of the National Potato Society in London. The leading cultivators are Messrs. J. Lord and W. Snow, both of Olney; the Giant King proved a very good, flattish-round, exhibition variety. Fruit was somewhat limited owing to the season, but generally good; vegetables were numerous, and of remarkably good quality. Among cut flowers the collections of wild flowers were very interesting, showing that this part of the country has a wealth of these indigenous floral beauties.

In the open classes a group of six very good stove and greenhouse plants were shown by Mr. H. Ward, gr. to W. Jeffrey, Esq., Northampton, and consisted of *Vanda tricolor*, a fine variety of *V. suavis*, *Euphorbia splendens*, *Clerodendron Balfourianum* *Pandanus Veitchii*, *Cycas revoluta*, and *Phormium Colensoi* variegatum; 2d, Messrs. Hall & Co., nurserymen, Northampton. The best specimen plant was a fine *Dracaena excelsa* from Messrs. Ball & Co. A fine *Nerium Oleander* was shown by Mr. H. Chattle, Northampton. Mr. Ward had the best six Ferns, consisting of *Adiantum farleyense*, *Neottopteris Nidus*, *Adiantum formosum*, *Pteris cretica albolineata*, *Dicksonia antarctica*, and a Stag's-horn Fern. Some small but nicely grown *Caladiums* came from Messrs. Ball & Co., Northampton.

Messrs. Jno. Perkins & Co., Market Square, Northampton, had some well grown and flowered *Zonal Pelargoniums*, and staged, in addition, a large group of miscellaneous flowering plants, all well grown and very interesting. A group of plants, both foliage and flowering, came from Messrs. Ball & Co., and to both collections extra prizes were awarded.

In the open class cut flowers comprised stove and greenhouse plants, *Zonal Pelargoniums*, admirably shown by Messrs. Ball & Co., *Zinnias*, fine and varied in colour, *Panzies*, *Verbenas*, &c. The fine weather brought a great many visitors to the town from Northampton and elsewhere.

The Birmingham Horticultural Exhibition: Aug. 10 and 11.—The Botanic Gardens is a charming place for a flower show, and the plants are arranged here under a large tent, in which there are raised beds and banks, as at the Regent's Park. The gardens themselves are admirably laid out, and are rich in ornamental trees and shrubs, and so charmingly situated, that no more appropriate place could be found in the neighbourhood of Birmingham.

Fuchsias formed the most striking feature of the show, 33 specimen plants being staged for the various prizes, and each a perfect example of what a *Fuchsia* should be. The whole lot were even in height, bushy to the bottom, wonderfully well grown, and beautifully flowered. The chief exhibitors were W. Mathews, Esq., and Henry Heaton, Esq.

The first prize lot of flowering and ornamental plants exhibited by Mr. Walter Jones, gr. to C. E. Mathews, Esq., contained a grand *Statice profusa*, and the entire group were of first-class excellence. The same exhibitor had, in other classes, a very fine *Cocos Weddelliana* in flower, a superb *Clerodendron Balfourianum*, *Abutilon Boule de Neige*, which makes

a striking plant when well flowered; six very fine Caladiums, which took the 1st prize; a pretty group of new Dracenas, and a fine plant of the beautiful Croton Weismanni, richly coloured. Mr. John Crisp, gr. to B. Scarf, Esq., had also a good 2d prize lot of twelve flowering and ornamental plants. Mr. W. Dyer, gr. to T. W. Webley, Esq., obtained the 1st prize for six ornamental plants, which included very fine examples of Cyanophyllum magnificum and Croton variegatus, highly coloured. The same exhibitor took 1st prize for six Ferns, splendid plants, especially an Adiantum farleyense.

A good lot of really good Petunias were staged, not too large, and well flowered and well grown. Some capital Gloxinias were shown, and Mr. Stacey, gr. to F. Osler, Esq., took the 1st prize for three fine well-grown plants of Erica Aitonia, E. profusa, and E. tricolor Eppsi. Cockscombs and Achimenes were also very good, and the Zonal Pelargoniums were not too large, and were well grown and well flowered. Two specimen plants of a blunt pyramidal form were striking objects of first-rate culture, and gave an idea of the superiority of this form over the usually flat style of growth we invariably see. There was a nice display of exotic Ferns, two or three collections of British Ferns, some pans of Lycopods exceedingly well done, and a few really good pans of Achimenes.

Mr. R. H. Vertegans, Chad Valley Nurseries, sent (not for competition) a large basket of Bouvardia Humboldtii corymbiflora in full bloom—a grand plant for decorative work, as well as for bouquet use; examples of Lobelia Ebor, a very fine dark blue; L. Miss Egerton, a most useful white, and other kinds for comparison; a fine collection of Caladiums, and a group of Begonia metallica. Messrs. Felton & Sons contributed a nice collection of rare ornamental plants, which included Encholirion Saundersii, a pretty, double, pink-flowered Zonal Pelargonium, with foliage marked as in Cloth of Gold, but much whiter in colour—a really good thing; also Maranta virginialis major and Tillandsia tessellata, both very desirable plants.

Messrs. Evans & Pountney exhibited samples of their registered Venetian window-box, the front of which is composed of horizontal strips of iron to admit of planting Golden Feather and other foliage plants in lines or otherwise, and which gives to the front of the box a most ornamental appearance.

Some excellent bouquets were shown, and Mr. Samuel Brown, one of our old Birmingham florists, exhibited some first-class Carnations and Picotees, such as Charles Turner is in the habit of turning out. There were a few good Dahlias, and amongst Roses, Reynolds' Hole, Antoine Marton, Fisher Holmes, and E. Y. Teas were especially good.

The display of fruit was not large, but very good. The arrangement of the exhibition was perfect, thanks to Mr. Latham.

Cheadle Floral and Horticultural; Aug. 10 and 11.—The tenth annual exhibition of the above Society was held in a large field very conveniently situated and easy of access, which was kindly placed at the disposal of the committee by Dr. Godson, a gentleman residing in the immediate vicinity. Favoured with beautiful weather, this show was certainly one of the finest that this deserving Society has ever held, and the numbers who visited it was a certain sign that this annual display is eagerly looked forward to, and highly appreciated by a very large number from the surrounding districts in Cheshire, as well as also by a great many on the northern banks of the river Mersey. The fact that the number of exhibits amounted to the high figure of 569 will at once be understood as indicating the widespread interest taken in the Society; and when, as was the case on this occasion, the whole of the subjects were of unusual excellence, the committee may well take heart, resting assured that here at least they are fostering and encouraging a healthy rivalry among amateurs and gardeners, and that with such an object in view, supplemented with a liberal schedule, they are meeting with a large amount of success. This result, of course, brings great credit to the Society; but in this case, and many others of a like nature, the chief benefit accrues to those who have the culture of the plants, fruits, &c., and with the culture the gratification of beholding their labour and diligence producing results that may truthfully be described as first-class. In the large tent, which was 200 feet long by 56 wide, a fine collection of plants was staged, the centre and side tables being as full as they could be. Two other tents, 100 feet by 27, and one other, about 60 feet by 25, were also taken up by the large number of exhibits, whilst on the grounds were some well designed summer-houses, horticultural implements, and other articles usually seen at meetings of this description. In the open class for ten stove and greenhouse plants, flowering and ornamental, the 1st prize was taken by E. Cole & Sons, among whose plants were Statice profusa, a splendid piece, densely flowered, Ixora coccinea, with about forty expanded heads of bloom, and others in a very forward state, Allamanda nobilis very fine, Erica Lindleyana, Geouma

Schottii, and a remarkably well-coloured plant of Croton Johannis—this makes a grand exhibition plant. In the corresponding class for amateurs the 1st prize was awarded to H. Samson, Esq., Bowdon, gr. W. Lingard, who staged capital plants of Erica Holfordii, a good Stephanotis, Erica Aitonia superba, and E. Parmentieria rosea, Croton variegatus, &c. The 2d prize fell to E. Bowdon, Esq.; a fine lot was staged by J. Rylands, Esq., G. Smith gr. For six stove and greenhouse plants, J. Rylands was placed 1st, whose plants of Dipladenia amabilis, Erica venosa, and Jacksoni were all that could be desired; a fine Latania rubra was also in this collection. S. Schloss, Esq. (W. Cardwell, gr.), was 2d, who had a capital Ixora coccinea; the 3d prize fell to E. Bowdon. For six fine foliage plants the 1st prize was taken by E. Bowdon, who had fine plants of Dicksonia antarctica, Phormium tenax variegatum, Dasyllirion, Cocos Weddelliana, Croton Wiesmanni, and Thrinax elegans; J. Rylands was 2d, among whose plants we observed a fine plant of Todea superba, and also Nepenthes Hookeri in good condition; Mr. Gammon and Mrs. Sykes were placed equal 3d. This class was well contested. For six Exotic Ferns H. Samson was 1st with fine examples of Gleichenia spelonca, flabellata, and semivestita, Dicksonia antarctica, Cibotium Schiedeii and C. spectabilis; S. Schloss was 2d, who had Gleichenia spelonca and Brainea insignis in capital order. For four Adiantums, J. Rylands was again to the front, his plants of A. lunulatum and gracillimum being in their very best; E. Coward, Esq., was 2d; D. Adamson, Esq., taking the 3d. Six Caladiums: This class was well contested, the 1st prize being awarded to D. Adamson, Esq. (J. Brierley, gr.), who showed Beethoven, Meyerbeer, and Argyrites, in fine condition; Mrs. Sykes was placed 2d. Liliun lancifolium was shown by the latter lady, who was placed 1st, the 2d being taken by D. Maclure, Esq. For three pots of Achimenes, D. Adamson, Esq., was deservedly placed 1st, his plants of Carl Woolforth, Dentoni, and Edmond Bossier, being really splendid. For four Fuchsias, T. H. Sykes, Esq. (S. Moorhouse, gr.), staged fine pyramids of Wave of Life, Venus de Medicis, Rose of Castille, and Inimitable. Liliun auratum was shown by E. Birks, Esq., and placed 1st. Some splendid examples of Coxcombs were staged, and capital plants of Celosia pyramidalis plumosa, the prizes in the latter class being taken by D. Maclure 1st, and W. Sykes 2d. Some capital pans of Lycopods were staged by G. W. Mould, Esq., Mrs. Sykes, and Dr. Reed—prizes awarded in the order named. In this tent were plants staged by Mr. Mackellar, gr. to Sir James Watts (not for competition), including among others, Erica aemula, Irbyana, Holfordii, fine specimen, 3 to 4 feet through; a Peristeria elata, with ten spikes of its singular and interesting flowers; two fine specimens of Yucca filamentosa variegata, and a very distinct form of Dicksonia antarctica.

The fruit and vegetables, which completely filled one of the second-size tents, was uniformly good. The 1st prize for six dishes of fruit being taken by Mrs. Sykes, gr. G. Kemp, the 2d falling to D. Adamson, Esq. For two bunches of black Grapes, the 2d prize only was awarded to E. Bowdon, whilst for two bunches of Muscats the 1st was awarded to H. Sampson, Esq., the 2d to J. Rylands. T. H. Sykes took 1st for the heaviest bunch of Grapes with Black Hamburgs, the 2d again falling to J. Rylands. Sir J. Watts sent two trays of fruit, not for competition, which included five bunches of Muscats, Black Hamburg, two bunches on a lateral, Peaches, Pine, Cherries, &c.—a very creditable lot. For ten distinct varieties of vegetables, the 1st was taken by J. P. Tambaci, Esq., gr. G. Kemp, the 2d by—Holder, Esq.; 3d, by Dr. Reed.

For groups of twenty plants arranged for effect a number of collections were staged, a tent being almost entirely devoted to these and groups of bedding plants. In the former case prizes were taken in the order named by Mrs. Sykes, D. Adamson, R. Gammon, and G. W. Mould being equal 3d. Bouquets, cut blooms, and stands of flowers were numerous, and showed much patience and skill. Collections of wild flowers were also very interesting. Some very fine vegetables were staged by cottagers, competition in most cases being very severe.

Some fine stands of Roses were exhibited by W. Paul & Son, Cheshunt, and also by E. Cole & Sons, Withington. A large number of miscellaneous plants were staged by J. Hooley, nurseryman, of Stockport. Space forbids mention of many other things of a highly meritorious character. Enough however, will have been noticed to show that the Committee here are doing a real good work. W. S.

A LIVE WHITE BLACKBIRD may now be seen at the "Ship" Inn, Leigh, Essex. It was taken from the nest, in which there were four other blackbirds. It is now about ten weeks old. I saw it myself a few days ago. R.

The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, AUGUST 15, 1877.

Aug. 9.—Fine, but dull and cloudy. Occasional showers of rain.
 10.—Fine, but cloudy, and showery at times.
 11.—A fine day, but generally cloudy.
 12.—Fine day, but frequently very cloudy and dull.
 13.—Fine, but cloudy. A few slight showers.
 14.—A very fine clear warm day.
 15.—Overcast, dull, with slight rain till 10.30 A.M. Fine and bright afterwards. Warm. Cloudless at night.

LONDON: Barometer.—During the week ending Saturday, August 11, in the vicinity of London the reading of the barometer at the level of the sea increased from 30.08 inches at the beginning of the week to 30.09 inches by the morning of the 5th, decreased to 29.49 inches by the evening of the 7th, increased to 29.52 inches by the morning of the 8th, decreased to 29.49 inches by the afternoon of the same day, and increased to 30.07 inches by the end of the week. The mean reading for the week at sea level was 29.82 inches, being 0.14 inch below that of the preceding week, and 0.12 inch below the average.

Temperature.—The highest temperatures of the air observed by day varied from 76° on the 5th to 68° on the 11th; the mean for the week was 71½°. The lowest temperatures of the air observed by night ranged from 54¼° on the 10th to 61° on the 7th; the mean for the week was 56¾°. The mean daily range of temperature in the week was 14¼°, the greatest range in the day being 20¾° on the 5th, and the least 9°, on the 7th.

The mean daily temperatures of the air, and the departures from their respective averages, were as follows:—5th, 63° 9', +1° 8'; 6th, 65° 7', +3° 6'; 7th, 63° 8', +1° 8'; 8th, 60° 8', -1° 2'; 9th, 60° 8', -1° 3'; 10th, 60° 7', -1° 4'; 11th, 60° 0', -2° 2'. The mean temperature of the air for the week was 62° 3', being 0° 2' above the average of sixty years observations.

The highest readings of a thermometer with blackened bulb in vacuo, placed in sun's rays, were 134° on the 5th, 126° on the 9th, and 120° on the 13th; on the 7th the reading did not rise above 81°. The lowest readings of a thermometer on grass, with its bulb exposed to the sky, were 42¾° on the 11th, 46¾° on the 5th, and 47¼° on the 6th; the mean of the seven low readings was 49¾°.

Wind.—The direction of the wind was S.W. and its strength gentle. The weather during the week was generally fine but showery, and the sky cloudy. Thunder was heard during the afternoon of Wednesday the 8th inst.

Rain fell on five days during the week; the amount collected was 0.76 inch.

ENGLAND: Temperature.—The highest temperatures of the air observed by day were 80° at Cambridge, 79¾° at Nottingham, 79¼° at Bristol, and 78¾° at Leicester; at Sunderland the highest temperature was 70°, the mean value from all stations was 75¼°. The lowest temperatures of the air observed by night were 45¼° at Bristol, 47° at Truro, and 47¾° at Nottingham; at Blackheath 54¾° was the lowest temperature in the week, the mean from all stations was 50¾°. The range of temperature in the week was the greatest at Bristol 34°, and the least at Sunderland 18°; the mean range of temperature from all stations was 24¾°.

The mean of the seven high day temperatures was the highest at Cambridge 75°, Nottingham 72¾°, and Norwich 72¼°; and the lowest at Sunderland, 65¾°. The general mean from all stations was 69¾°. The mean of the seven low night temperatures was the

lowest at Eccles, 52³/₄, and the highest at Portsmouth, 58°; the mean value from all stations was 55¹/₂°. The mean daily range of temperature was the greatest at Cambridge, 20³/₄°, and the least at Plymouth, 9³/₄°; the mean daily range from all stations was 14³/₄°.

The mean temperature of the air for the week from all stations was 60³/₄°, being 2° lower than the value for the corresponding week in 1876. The highest were 63° at Cambridge; and the lowest 58¹/₂° at Wolverhampton, Liverpool and Sunderland.

Rain fell on every day in the week at Sunderland, and on five days at most other stations. The amounts measured varied from 1.64 at Truro, 1.55 at Plymouth, and 1.24 inch at Bristol, to half an inch at Portsmouth, Leicester, Liverpool, and Leeds; the average fall over the country was 0.88 inch.

The weather during the week was gloomy, dull and showery; and the sky cloudy. Thunderstorms occurred at Wolverhampton and Bradford, on the 8th inst.

SCOTLAND: Temperature.—The highest temperatures of the air varied from 75° at Dundee to 65³/₄° at Aberdeen; the mean value from all stations was 70³/₄°. The lowest temperatures of the air ranged from 46° at Edinburgh and Aberdeen to 49¹/₄° at Glasgow; the mean from all stations was 47¹/₄°. The mean range of temperature from all stations was 23°.

The mean temperature of the air for the week from all stations was 59°, being ³/₄° higher than the value for the corresponding week in 1876. The highest was at Dundee, 60°, and the lowest at Aberdeen, 58¹/₄°.

Rain.—The fall of rain in the week varied in amount from 1¹/₄ inch at Aberdeen, and rather more than 1 inch at Glasgow, to half an inch at Edinburgh; the average fall over the country was eight-tenths of an inch.

DUBLIN.—The highest temperature of the air was 72¹/₄°, the lowest 50³/₄°, the range 21³/₄°, the mean 61°, and the fall of rain 0.47 inch.

JAMES GLAISHER.

Obituary.

WE learn with very great regret of the death of Dr. HUGH ALGERNON WEDDELL, who died on July 22, at Poliers. Dr. Weddell was of English extraction, but had long resided in France, where he was for some years an aide naturaliste of the Jardin des Plantes. On behalf of the French Government he undertook during five years a voyage in Southern Peru and Bolivia, contributing largely to our knowledge of the botany of those regions. The account of his travels is given in his *Voyage dans le Nord de la Bolivie*, while the botanical details may be found in his *Chloris Andina*; or *Description of the Alpine Plants of the Cordilleras*, a work, unfortunately, never completed. Some notes on the vegetation of Brazil, Bolivia, and Peru, translated from the French, are contained in the sixth volume of the *Journal of the Horticultural Society, London, 1851*. Previous to the publication of the *Chloris Andina*, however, he had earned for himself a well founded and widely extended reputation for his *Histoire Naturelle des Quinquinas*; or, *Monograph of the Genus Cinchona*, a splendid publication which has formed the basis of what has since been written on the systematic history of the Cinchona. Other monographs from his pen were those on the large and varied family of Nettles, Urticaceae, those on Balanophorae, besides numerous minor ones on such subjects as hybrid Orchids, Cystoliths, Caoutchouc, Coca, Ipecacuanha, and latterly Lichens, Weddell having embraced the doctrine propounded by Schwendener that lichens are really fungi living parasitically on Algae. Dr. Weddell was present at the Botanical Congress at Amsterdam in April last, but was then in ill-health. His loss will be felt severely, as his amiable character, no less than his wide scientific attainments, endeared him to a large circle of friends, English as well as French.

Answers to Correspondents.

COVENT GARDEN MARKET PRICES: A Subscriber. The prices quoted in our last number were a fair average of the market prices ruling on August 9. Those published in the *Times* of the 11th inst. are, we believe, the retail prices realised for the very best samples, probably on the previous day. The prices vary from day to day, and sometimes frequently during a single day, so that exact figures cannot be given.

CUCUMBER: B. B. Your coiled Cucumber, in the form of a ram's horn, may be explained by the fact that the growth on one side has been checked, while that on the other has gone on.

DAHLIAS: T. S. We can give you no better advice, than recommend you to pay a visit to some of the most successful growers, and take a practical lesson.

FUCHSIA: E. Bland. Judging from the single flower there is nothing novel about your seedling Fuchsia. There are several in the same way, and unless it has a very good habit it should not be sent out.

GARDEN WALLS: W. W. There is nothing better that we can recommend than a wall built of ordinary bricks, but hollow, i.e., with ¹/₄ inches of a cavity in centre—this keeps it drier and warmer. The wall should then be wired according to plans being continually advertised in our columns.

GRASS: A. Z. The Sheep's Fescue—*Festuca ovina*, *Poa pratensis*, *Dactylis glomerata*, or a mixture of these.

GRAPES: S. Rose Hill. Yours is a very singular case. It does not seem the same as the ordinary scald, but not only is the whole berry affected, but there has been no sun to account for it, added to which your statement as to shade is against such a theory. As it is not confined to one house there must be some climatic cause which is quite beyond your control. You should, at any rate, burn all the affected bunches, and trust that, after you have got your Vines into as good health as possible, you may have an excellent crop next year. We should also recommend you to remove the present soil, and whitewash the house, and the sooner the better, unless sufficient Grapes are left to make them worth preserving. M. J. B.—C. W. S. The berries were in such a state of putrescence that we had no opportunity of ascertaining the early stage of the disease. It does not seem to be the same with the disease of "S., Rose Hill;" but we fear that there is something in the season which induces decay,—possibly the small comparative portion of direct sun-light, a defect which is as injurious to the vegetable as to the animal kingdom. In both cases there does not seem to be the slightest defect of treatment. The very best cultivators will sometimes meet with such untoward and unmanageable cases. M. J. B.—W. D. The berries are injured by the well-known Rust, which may have arisen from any of several causes, such as cold draughts, or handling or rubbing against them when thinning, or the injudicious use of sulphur at an early stage of their growth.

HERBACEOUS PLANTS: G. We will endeavour to comply with your request.

INSECTS: J. L. The larva of the handsome Privet moth—*Sphinx ligustri*.—J. Kitley. Smashed beyond recognition before it reached us. Such minute subjects should always be sent in a quill.—P. W. J. The insects are all dried up, so as not to be visible. They are, no doubt, a species of Spring-tail, some of which are injurious to plants,—not Thrips. A. M.

MELONS: F. P. J. The Melon leaves received were sun-scorched and filthy dirty. A little timely attention to ventilation would have prevented the former, and persistent fumigation, or dressing with Gishurst Compound, would have kept down the insects; as it is, you have got a nice collection!

NAMES OF PLANTS: Levi Hartley. The Orchid of which you send leaf is perhaps *Pescatoria lamellosa*, but without better material we cannot be certain. The *Dendrobium* is *D. moschatum*; and the other we have been unable to name, and have sent to Prof. Reichenbach.—H. & Co. 1, *Sedum spurium*; 2, *Centaurea montana*; 3, *Althea officinalis*; 4, *Carduus heterophyllus*; 5, *Sedum kamschatkicum*; 6, *Centaurea*; 7, *Actæa racemosa*; 9, *Sedum spurium*, white variety.—K. S. *Polygonum cuspidatum*.—J. M. *Smilax aspera*.—R. C. *Appleton*. *Epidendrum amictum*. Will you kindly send us a good leaf for the herbarium.—J. C., *Greenland*. Possibly *Zephyranthus Atamasco*, of North America, but send a better specimen next year.—John Lewan. 1, *Pelargonium fragrans*; 2, *Achillea decolorans*; 3, *Artemisia*; specimen insufficient.—R. B., *Red-hill*. *Spiræa callosa*.—Edward Morse. *Trichocentrum albo-purpureum*. Will you kindly send us a leaf and another flower for the herbarium.—I. D. M. *Odontoglossum cordatum*.—J. S., *Cork*. 1, *Centaurea Scabiosa albiflora*; 2, *Cirsium acule*; 3, *Veronica canescens*; 4, *Potentilla colorata*; 5, *Veronica cuneifolia*; 6, *Heuchera caulescens*.—Greenbank. We cannot even make a guess at the solitary, smashed, and rotten flower you send; carefully pack a good specimen, and we will then name it. Correspondents should not expect too much from us; we do not name plants by inspiration, and, if they wish for a correct name, should furnish us with a good specimen, and not a solitary leaf or flower, or a wretched scrap, rendered still more deplorable by H.M. post officials.—J. M. *Hypericum hircinum*.—H. S. *Euphorbia Lathyris*.—A. Z. *Caragana spinosa* and *Olearia Haastii*.—E. E. *Achobitum variegatum*.—F. H. K. *Tellima grandifolia*, a North American plant; quite hardy, and almost naturalised in some places.—Reader. We cannot name plants from mere rooted cuttings.

NUT BUSHES: W. J. Your plants will probably bear freely when they get thoroughly established. Pruned trees want taking in hand from the first, but it is quite unnecessary in ordinary cases.

PEACH ROOTS DEAD: G. S. We can only suggest from your account that they may possibly have had an overdose of guano.

PEAR LEAVES: W. Partridge. The fungus on your Pear leaves is the *Aëcidium* condition of *Roeselia cancellata*. All we can recommend you to do is to remove the leaves and burn them.

POTATOS: G. Cooling. Your seedling varieties, numbered 1 and 2, were both handsome in appearance and of good quality when cooked, qualities equally conspicuous to many others already in cultivation.

RED CABBAGE: W. P. Red Cabbage is as much a vegetable as a Beet, or an Onion, and you were wrongfully disqualified, if the terms of the schedule did not

specially exclude it. How can it be classed as a salad plant?

RED-SPIDER: G. G. If the plants are bearing fruit, syringe them well with clean cold water only.

THE FEATHERY COLUMBINE. If J. G. cannot get *Thalictrum aquilegifolium* from any of the nurseries near him I shall have pleasure in sending him a plant if he will send his address to J. Clarke, Gr., *Cotthelstone, Taunton, Somerset*.

VINES MILDEWED: W. Estler. Keep the atmosphere of the house a little drier, and dust the affected leaves with flowers of sulphur, or dress them with Speed's Mildew Annihilator.

VINES SHANKING: H. C. The cause of your Vines shanking so much is no doubt owing to the roots penetrating into the cold subsoil. The remedies you adopted last year were only half sufficient, you must take up all the roots, do not be afraid. The berries not setting is due to a lowness of temperature, chills it may be, and this is also conducive to shanking. Is it the true Black Hamburg?

VRIESIA RETICULATA: J. C. P. It has not been long in cultivation, and consequently has not often been seen in flower.

FOREIGN SUBSCRIBERS sending Post-office Orders are requested to make them payable at the post-office, King Street, Covent Garden, London, and at the same time to inform the Publisher at the office of this Journal.

CATALOGUES RECEIVED.—Messrs. Paul & Son (The Old Nurseries, Cheshunt), Autumn Catalogue of Bulbs, Strawberries, &c.—Louis Van Houtte (Ghent, Belgium), Catalogue of Azaleas, Camellias, Rhododendrons, &c.—R. Parker (Exotic Nursery, Tooting, S.W.), Catalogue of Hardy Alpine and Herbaceous Plants, Fruit Trees, &c.—H. Cannell (Swanley Junction, Kent), General Autumn Catalogue.—Thomas Kennedy & Co. (Dumfries), Catalogue of Select Dutch Flower Roots.—Messrs. Haage & Schmidt (Erfurt, Prussia), Catalogue of Seeds, Bulbs, Plants, &c.—Dickson, Brown, & Tait (43 and 45, Corporation Street, Manchester), Autumn Catalogue of Dutch and French Flowering Bulbs.

COMMUNICATION RECEIVED.—Amateur (in a future number).—P. H. G. (we will endeavour to meet your wishes).—W. G.—E. G.—J. W.—G. Lee.—Mrs. T. M. W. (next week).—B. W.

Markets.

COVENT GARDEN, August 16.

The soft fruit being nearly over, our market begins to assume a quieter appearance. Apples and Nuts are almost the only home produce we have now to dispose of, the supply of Plums being almost nil. Grapes are a heavy trade, except for very good samples, large quantities reaching us from the Channel Islands at a very low price. Pines and Peaches are in better demand. James Webber, Wholesale Apple Market.

SEEDS.

LONDON: August 15.—The seed market has been fairly attended this week, and in those kinds of seeds needed for present sowing there has been a good trade doing. The three varieties now most in request are Mustard, Rape, and Trifolium incarnatum. For the first-named we have a brisk sale at full rates, whilst Rapeseed (on account of its extremely deficient yield, which becomes more and more apparent) must be noted 1s. to 2s. per qr. dearer. Trifolium now comes to hand more freely; its abundant supply keeps prices at a low level. Winter Vetches have opened at a moderate figure; as yet no large quantity has appeared at market. New Kye continues in short supply, in consequence of which rather high rates are realised. For large blue Peas of the new crop there is a brisk inquiry; fine samples will, it is feared, be scarce. In red Clover seed hardly any transactions are just now taking place. A few parcels of Trefoil and white Clover have lately changed hands at a slight increase on previous currencies. Canary seed has during the last few days met with more attention; and values have exhibited an upward tendency; the same can also be said of Hemp seed. Feeding Linseed is steady. *John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.*

CORN.

At Mark Lane on Monday trade was again dull, and Wheat was quoted at prices nominally the same as last week, the tendency being perhaps towards reduction. Some new Talavera Wheat, weighing 64 lb. to the bushel, realised 72s. per quarter, while some of about 62 lb. or 63 lb. weight made 68s. per quarter. There was also some new Kentish Wheat, which changed hands at 64s. to 65s. per quarter. Barley was well held, though indifferently sought after; while Maize, which was in moderate request, was the turn in favour of the seller. Oats were hard to move, and in some instances were 6d. cheaper. Malt was unchanged. Beans and Peas were not very well supported, while as regards flour the market was distinctly weak. On Wednesday the trade was heavy. There was no material change in prices, business being too limited to test the strength of the market, but where there was any pressure to realise, a decided reduction had to be submitted to as regards Wheat and most other classes of produce. Barley remained firm. Average prices of corn for the week ending August 11:—Wheat, 65s. 2d.; Barley, 34s. 7d.; Oats, 27s. 4d. For the corresponding week last year:—Wheat, 45s. 10d.; Barley, 32s. 2d.; Oats, 29s. 5d.

CATTLE.

At the Metropolitan market on Monday there was a few more beasts than on that day's night, but there was a demand for them, and that day's prices were freely given. The supply of sheep was very small; though trade was by no means brisk. The top quotation was, however, exceeded for a few choicest qualities. Lambs were not very plentiful, but the trade for them has fallen off, and prices on the average were lower. The few calves on offer made a good price. Quotations:—Beasts, 5s. 8d. to 6s., and 5s. 6d. to 5s. 8d.; second quality beasts, 4s. 4d. to 5s.; calves, 5s. to 6s. 4d.; sheep, 6s. 8d. to 7s., and 6s. 4d. to 6s. 8d.; ewes and second quality, 5s. 6d. to 5s. 10d.; lambs, 6s. 8d. to 7s. 8d.; and pigs, 4s. to 5s. 4d.—On Thursday the supply of beasts was limited, but equal to the demand, which ruled quiet at about Monday's prices. Sheep, a short supply; trade was quiet but prices were maintained. Lambs sold at late rates. Calves and pigs were weak.

HAY.

At Whitechapel on Tuesday all classes of fodder except straw were firm. The demand was steady. Prime old Clover, 100s. to 140s.; inferior, 85s. to 95s.; good new Clover, 100s. to 120s.; prime old meadow hay, 90s. to 124s.; inferior, 70s. to 85s.; good new hay, 80s. to 100s.; and straw, 44s. to 58s. per load.—On Thursday a fair supply of fodder was on sale, with a dull trade. Quotations:—Prime old Clover, 100s. to 137s.; inferior, 85s. to 95s.; prime old meadow hay, 90s. to 120s.; inferior, 70s. to 85s.; good new, 80s. to 100s.; and straw, 44s. to 58s. per load.—Cumberland Market quotations:—Superior old hay, 120s. to 130s.; inferior, 90s. to 105s.; new hay, 80s. to 105s.; superior old Clover, 132s. to 140s.; inferior, 100s. to 110s.; new Clover, 90s. to 120s.; and straw, 54s. to 58s. per load.

POTATOS.

At the Borough and Spitalfields markets on Monday, there was a steady demand for Potatoes of all descriptions not absolutely diseased, and the following are the quotations:—Kent Regents, 110s. to 160s.; Essex do., 110s. to 145s.; shaws, 90s. to 100s.; kidneys, 60s. to 80s.; Early Rose, 80s. to 100s. per ton.

THE NEW SEEDLING ROSE.

All who are interested in Roses for Bedding, should visit Sunningdale Nursery, where the

"QUEEN OF BEDDERS"
(NOBLE)

Can be seen in unwonted beauty.

At this moment a bed, 25 by 50 feet, has 22,500 buds and flowers upon it.

The Nursery is only five minutes' walk from the Sunningdale Station, South-Western Railway.

CHOICE FLOWER SEEDS
For Present Sowing.

Our own superb strains, guaranteed of unsurpassable quality. Post-free on receipt of P.O.O. or Stamps.

	Per packet—s. d.
AURICULA, choicest mixed, alpine	6d. and 1 0
CALCEOLARIA HYBRIDA, very choice, mixed	1s. 2 6
CINERARIA HYBRIDA, from named flowers	1s. 2 6
CARNATION and PICOTEE, from stage flowers	1s. 2 6
HOLLYHOCK, Prize English	6d. 1 0
INDIAN PINK, splendid double, mixed	6d. 1 0
MIMULUS, Clapham's superb, very fine	1 0 0
MYOSOTIS DISSITIFLORA—Forget-me-not	6d. 1 0
PANSY, choicest mixed English	6d. 1 0
PRIMULA SINENSIS, choicest mixed	1s. 2 6
POLYANTHUS, finest gold-laced, choice	1 0 0
STOCK, Brompton, scarlet Giant	6d. 1 0
— East Lothian, splendid	6d. 1 0
SWEET WILLIAM, very choice, mixed	6d. 1 0
WALLFLOWERS, splendid double, mixed	6d. 1 0
GREENHOUSE PERENNIALS, 12 fine varieties	6 0 0
HARDY PERENNIALS, 12 choice sorts, Pansy, Hollyhock, &c.	4 6 0

DANIELS BROS.,

ROYAL NORFOLK SEED ESTABLISHMENT,
Norwich.

Pine-apple Nursery, Maida Vale, London, W.

E. G. HENDERSON AND
S. SON can supply Seed of the following; quality of strains are the best that can be grown:—

PRIMULA SINENSIS FIMBRIATA, mixed colours or separate, 2s. 6d. per packet.
PRIMULA SINENSIS FIMBRIATA, double-flowered, mixed, 2s. 6d. and 5s. per packet.
PRIMULA SINENSIS FIMBRIATA, Maiden's Blush, new double, 2s. 6d. and 5s. per packet.
CINERARIA and CALCEOLARIA, 2s. 6d. each packet.

EATON and DELLER, 6 & 7, Crooked Lane, London Bridge.

Oil Paint No Longer Necessary.

HILL AND SMITH'S BLACK VARNISH for Preserving Ironwork, Wood, or Stone.

This Varnish is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale.

Sold in casks of about 30 gallons each, at 1s. 6d. per gallon, at the Manufactory, or 1s. 8d. per gallon carriage paid to any Station in the Kingdom.

UNSOLICITED TESTIMONIAL RECEIVED MAY 3, 1877. "The Rylands, Alderly Edge, Manchester.—Messrs. Hill & Smith.—Sirs.—For some 20 years I have used your 'Black Varnish,' and shall be glad if you will forward me another cask, as I consider it the best thing known for the preservation of all outdoor work, either wood or iron, that requires to be painted.

Apply to HILL and SMITH, Brierley Hill Ironworks, near Dudley; and 118, Queen Victoria Street, London, E.C., from whom only it can be obtained.

CAUTION.—It having lately come to the knowledge of HILL & SMITH that spurious imitations of this Varnish are being offered by unprincipled dealers at a slight reduction in price, they would especially draw attention to the fact that every cask of their Varnish is legibly marked with their name and address, without which none is genuine.

MESSENGER & COMPANY, MIDLAND HORTICULTURAL BUILDING & HOT-WATER ENGINEERING WORKS, LOUGHBOROUGH.

Horticultural Buildings erected on Messenger & Co.'s Patent Method of Construction are very strong, most durable, light, elegant, amply ventilated, perfect efficiency for intended purpose is guaranteed, are economical in cost and maintenance; combine the peculiar advantages of Wooden and of Iron Houses, without their disadvantages.

MESSENGER AND CO., from their long experience, and having large Works exclusively devoted to the Construction and Heating of Horticultural Buildings, are in a position to execute with despatch, in the best manner, the Orders with which they are entrusted. Only thoroughly well seasoned timber used.

The Plans of Landscape Gardeners, Architects, and Others carried out. Plans and Estimates forwarded on receipt of Particulars by Post. Ladies and Gentlemen waited upon.

Richly Illustrated CATALOGUE of DESIGNS, taken from Works executed by M. & Co., post-free for thirty-three stamps. Gentlemen consulting this Catalogue have the advantage of inspecting designs whose efficiency has already been tested by experience.

ART WITH ECONOMY APPLIED TO CONSERVATORIES

In consequence of the increasing demand for Conservatories, in which pure art is combined with moderate cost, T. H. P. DENNIS & Co. have been led to introduce designs of a character hitherto unknown. One of these designs, showing a house 22 feet 6 inches x 13 feet 6 inches, is annexed, and the result, as regards the extremely low price (which includes fixing, glazing, painting, carriage, &c.), has been attained only by special machinery and a system of interchangeable parts.

T. H. P. DENNIS & Co. are also prepared to provide and fix Hot-water Heating Apparatus and Horticultural Buildings of any dimension or description.

Full-sized specimens of Greenhouses, &c., and Hot-water Apparatus in work, can be inspected at Mansion House Buildings, London, E.C.

Gentlemen waited upon at their residences by experienced designers.

Estimates and Plans free.

JOSEPH BRAMHAM, HORTICULTURAL
and **HOT-WATER ENGINEER, WIRE WORKER, WEAVER,**
&c., 104, Dale Street, and 44, Elizabeth Street, Liverpool.
J. B. strongly recommends the **ALLERTON PRIORY**
BOILER as one of the most powerful for extensive work. He
has fixed one capable of heating 10,000 feet of 4-inch piping.
See *Gardeners' Chronicle*, p. 617. Also a **WELDED**
WROUGHT IRON WATERWAY BACK for ordinary
Saddle Boilers. These Backs can be fixed to any Boiler now in
use, and are a great saving in fuel and labour. He is also
prepared to fix any kind of Boiler made.
Manufacturer of the Registered **LIVER FRONT** for large
Boilers, **IRON and WIRE WORK** in all branches. Refer-
ences from Noblemen and Gentlemen for work done.
Plans and Estimates given.

CRITCHLEY'S PATENT
HEAT REGULATOR,
AN APPARATUS FOR REGULATING THE HEAT
IN HORTICULTURAL BUILDINGS.

A, Iron Box fitted up water-tight. B, Pipe or Supply of
Water from Boiler. C, D, Pipes for Circulating Hot-
Water. E, F, Pipes for Return of Water to Iron Box.
G, Pipe for Returning Water to Boiler. H, I, J, K,
Piston-Rods for Opening and Closing Valves.
The advantages of these Regulators are that houses may be
kept at different degrees of heat, or the circulation of water
and entirely stopped in one part and not in others. They
may be fitted with as many valves as required, and are
particularly adapted for forcing houses where top and bottom
heat is used. They may be fixed in any part of the apparatus
most suitable for working, without regard to the position of
the Boiler.

The following Testimonial has been received:—
"Berkley Castle, April 13, 1875.
"Gentlemen,—I am happy to inform you, now that the
late severe winter is past, that the Hot-Water Apparatus
erected by you does its work to my entire satisfaction. As
to the two Heat Regulators, which represent thirty valves, I
have had ample opportunities of practically proving them, and
unhesitatingly admit they are far superior to any other valve;
in fact, I think it the greatest improvement that has come out
for horticultural purposes.
"I am, Gentlemen, yours truly, "R. H. CROOK,
"Gardener to the Right Hon. Lord Fitzhardinge."
Estimates and Plans furnished for Warming Gentlemen's
Mansions and Public Buildings. Orders attended to in any
part of the kingdom, and guaranteed to answer their intended
purposes. Prospectus and Price Lists post-free.

BULLETIN d'ARBORICULTURE de
FLORICULTURE, et de CULTURE MARAI-
CHÈRE. A monthly horticultural work, with superb Coloured
Plates and Illustrations. Published since 1865 by F.
BURVENICH, E. PAVNAERT, E. RODIGAS, and H. J. VAN
HULLE, Professors at the Horticultural School of the Belgian
Government at Ghent. Post paid 10s. per annum.
H. J. VAN HULLE, Botanical Gardener, Ghent, Belgium.

ADVERTISERS are requested to note that
although we do not object to receive Letters to be called
for, we cannot undertake to forward them.

PARTNERSHIP.—A Nurseryman, carrying
on a successful business within 25 miles of London, is
desirous of meeting with a Partner. Failing health causes
Advertiser to wish to find a man, or men who in, say, one or
two years would be able to take over from him the entire busi-
ness. Money would be required, but every facility be afforded
provided substantial guarantees were given. The fullest refer-
ences given and required.—Address, by letter, giving outline
of means and position, NURSERYMAN, Messrs. Norris,
Allens & Carter, Solicitors, 20, Bedford Row, London, W.C.

WANTED, a SINGLE-HANDED GAR-
DENER, at a country house in Yorkshire Occa-
sional assistance.—A. B., Post-office, Middleham, near Bedale.

Nursery Foreman.

WANTED, an active, steady Man, of good
address, as **GROUNDFOREMAN**; must be well up
to the Value and Culture of Fruit Trees, Roses, Evergreens,
&c. Wages, to commence, 35s. per week.—Apply, stating age,
with references, to R. S., *Gardeners' Chronicle* Office, W.C.

Propagator of Roses, Rhododendrons, &c.
PAUL AND SON want a clever, experienced Man, as Propagator (Indoors) of Roses, General Hardy Stuff, and Soft-wooded Plants. Efficient help and every encouragement given to a really painstaking Man.—Apply, by letter, to The Old Nurseries, Chesham, N.

WANTED, an efficient and steady MAN, for the Soft-wooded Department of a London Nursery. To an active and intelligent man the situation would be a good one and permanent. None need apply whose character will not bear the strictest investigation. State age, wages expected, and where experience has been acquired, to M. N., *Gardeners' Chronicle* Office, W.C.

WANTED, a young MAN with a good knowledge of Herbaceous and Bulbous Plants.—**JAMES DICKSON AND SONS,** Newton Nurseries, Chester.

WANTED, a young MAN, from 18 to 20 years of age, well used to Garden Work.—State wages required, &c., to W. G. HAZELL, The Gardens, Caterham Court, Surrey.

WANTED, at once, SIX good NURSERY HANDS for the Outdoor Department. Good planting hands will find permanent employment.—**JOHN STANDISH AND CO.,** Royal Nurseries, Ascut.

Seed Trade.
WANTED, by a Retail House in Scotland, a HEAD SHOPMAN of experience, able to take the entire Management in the absence of the principal.—Apply, stating salary required, age, past experience, &c., to X. Y., care of Hurst & Son, 6, Leadenhall Street, London, E.C.

Seed Trade.
WAREHOUSE or SHOPMAN.—Age 26, single; has had great experience in both the Retail and Wholesale Departments. First-class references.—**J. D. S.,** *Gardeners' Record* Office, Middle Abbey Street, Dublin.

WANTED, a young MAN that knows something of the Retail Seed Trade; one with a knowledge of Plants preferred. A good opportunity for a young man wishing for a start. State wages required, and where last employed.—**W. MUNDAY,** Rose Street, Wokingham, Surrey.

WANT PLACES.

B. S. WILLIAMS, having at the present time several very excellent GARDENERS upon his Register, is desirous of placing them in Situations where great experience and trust are required. B. S. W. would at the same time beg to intimate that when a Gardener is applied for that the filing of the situation should be left with him, as that would prevent unnecessary correspondence and delay.—Victoria and Paradise Nurseries, Upper Holloway, London, N.

Head Gardeners.
JOHN LAING AND CO. can at present recommend with every confidence several energetic and practical Men, of tested ability and first-rate character. Ladies and Gentlemen in WANT of GARDENERS and BAILIFFS or GARDENERS for First-rate Establishments or Single-hand Situations, can be suited, and have full particulars by applying at Stanstead Park and Rutland Park Nurseries, Forest Hill, London, S.E.

E. G. HENDERSON AND SON have many excellent GARDENERS with approved testimonials for ability now waiting in their Nurseries for re-employment.

E. G. H. & Son will be pleased to answer any enquiries from Noblemen and Gentlemen requiring such.—Pine-apple Nursery Maida Vale, London, W.

GARDENER (HEAD).—Age 31, married, no family; understands the profession in all its branches. Three years' experience.—A. B., 15, Clark's Cottages, Marsh Street, Walthamstow.

GARDENER (HEAD).—Age 34, married; thorough practical knowledge of the profession in all its branches. Good character.—A. W., Inverness Villas, Staines Road, Hounslow, W.

GARDENER (HEAD).—Age 36, married, two children; thorough practical experience in all branches of the profession. Four years' character. Please state particulars.—T. WOOD, Ansty Manor, Alton, Hants.

GARDENER (HEAD), where several men are kept.—Age 36, married; twenty-three years' practical experience in all branches of the profession. Nine years' character from present employer.—M. W., 34, Woodstock Road, Shepherds' Bush, W.

GARDENER (HEAD).—Single; thoroughly understands Orchids, Pines, Vines, Melons, Stove and Greenhouse Plants, Flower and Kitchen Gardening. Good references as Head.—G. W., Greenwood Cottage, Woodford, Essex.

GARDENER (HEAD), where two or more are kept.—Age 40, married, no family; thoroughly understands the profession inside and out. Left last situation owing to estate changing hands.—J. E., 17, Vork Rise, Kentish Town, N.W.

GARDENER (HEAD, or good SINGLE-HANDED).—Age 25, married, no children; thoroughly experienced and practical in all branches of the profession.—J. L., Mr. Parson's, near the Church, Walton-on-the-Hill, near Epsom, Surrey.

GARDENER (HEAD).—Thoroughly understands Forcing Vines, Flower and Kitchen Gardening; could take the Management of Meadow Land if required. Death the cause of leaving. Good references.—W. G., Mr. Coomber, Nurseryman, Calvery Road, Tunbridge Wells.

GARDENER (HEAD).—Age 32, married; thoroughly practical in Early and Late Forcing of all kinds of Fruits, Flowers, and Vegetables; has had sixteen years' experience in good Establishments. Five years' good character.—**W. POTTER,** 13, Union Place, St. Leonard's Road, Weymouth.

GARDENER (HEAD), age 32, married.—**W. SEDGLEY,** for the last three years gardener to the late H. Compton, Esq., Manor House, Lyndhurst, Hants, is at liberty to engage with any Lady or Gentleman requiring the services of a good practical gardener; sixteen years' experience.—**W. SEDGLEY,** The Gardens, Manor House, Lyndhurst, Hants.

GARDENER (HEAD), to any Lady or Gentleman requiring the services of the same.—Age 41, married, no family; thoroughly understands Gardening in all its branches, having lived in good places; twenty years' experience. Good character from the Gentleman he has just left. No single-handed place accepted.—**W. P.,** Room's Cottages, Garlands Road, Redhill.

GARDENER (HEAD), age 41, married.—A GENTLEMAN wishes to recommend his Head Gardener to any Lady or Gentleman requiring a really useful and practical man; he has had under his charge for three years a considerable quantity of Glass, large Garden, Pleasure Grounds, Park, Plantations, &c.; he is also sober and trustworthy.—**G. T. G.,** The Gardens, Cuthedge Park, Halstead, Essex.

GARDENER (HEAD).—Married, one child (age 6); has had great experience in the Cultivation and Forcing of all kinds of Fruit, Strawberries ripe this year March 20, Peaches, April 21, after fifteen weeks forcing only; is also a thorough Plantsman, including Orchids, and has been very successful in Growing and Forcing Vegetables and Salads. Desires a place where Gardening is carried on with spirit. First-class testimonials.—**W. ARMSTRONG,** The Gardens, Denham Court, Uxbridge, Bucks.

GARDENER (HEAD, WORKING), where three or more are kept.—Age 40, married, no family; thoroughly practical; Land and Stock.—Good reference.—**R. B.,** The Gardens, Kemnal, Chislehurst, Kent.

GARDENER (HEAD, WORKING), age 27; Understands Early and Late Forcing, Flower and Kitchen Garden, and the Culture and Botanical Classification of Alpines, &c.—**A.,** Dorset Villa, Somerset Road, Tottenham.

GARDENER (HEAD, WORKING).—Age 32, married, no family; thoroughly understands the profession. Satisfactory references. No single-handed place accepted.—**A. B.,** 3, Alfred Road, Harrow Road, Paddington, W.

GARDENER (HEAD, WORKING).—Age 29, single; thorough practical knowledge of the profession in all its branches; fifteen years' experience. Good character from last and previous situations.—**J. R. W.,** 1, Prospect Place, Holly Walk, Hampstead, London, N.W.

GARDENER (HEAD, WORKING), where one or more are kept.—Age 27; eleven years' experience in all branches; thoroughly competent and trustworthy. Two years in last situation. Any inquiries respecting character and abilities would be willingly answered by last employer.—**J. C.,** 150, Haverstock Hill, London, N.

To Nurserymen and Others.
GARDENER (HEAD, WORKING).—Age 25 would be given by the Advertiser for a comfortable situation as above. Wages, 24s. or 25s. per week, with cottage, &c. Good references.—**A. B.,** Mr. Covey, Bridge Street, Godalming.

GARDENER (HEAD, or good SINGLE-HANDED).—Age 39, married, two children; understands Forcing and Flower and Kitchen Gardening. Good character.—**R. SHERMING,** Syltcham, Schole, Norfolk.

GARDENER.—Age 24, single; thoroughly understands the Management of Flower and Kitchen Garden, Houses, &c. Good character and testimonials.—**T. B.,** 11, Railway Cottages, Tottenham, N.

GARDENER, age 31.—**Mr. ORSMAN,** Florence Road Nursery, New Cross, S.E., can with confidence recommend to any Lady or Gentleman a thorough practical Gardener, well up in Vines, Peaches, Melons, Cucumbers, Flower and Kitchen Gardening. In last situation five years.

GARDENER.—**JOHN COWAN,** The Vineyard, Garston, near Liverpool, would be glad to recommend to any Nobleman or Gentleman requiring a first-class Gardener a Man in the prime of life, who thoroughly understands the profession in all its branches, having had many years' experience in some of the best places in England and Scotland.

GARDENER (SINGLE-HANDED, or Other-wise).—Middle-aged. Good references. In or near Nottingham preferred.—**A. B.,** Post-office, Shearwood, near Nottingham.

GARDENER (SECOND or SINGLE-HANDED).—Age 22; steady; been at the profession from his boyhood. Near London.—**G. B.,** 31, Southampton Street, Strand, London, W.C.

GARDENER (SECOND).—Age 21; seven years' experience. Three years' good character.—Please state wages to H. K., Upper Caterham, Surrey.

GARDENER (SECOND).—Age 24; ten years' experience. Good references.—**T. S.,** Hampstead Road, Dorking, Surrey.

GARDENER (SECOND, or good SINGLE-HANDED).—Age 24. Good character. Near Manchester or London preferred.—Apply, stating full particulars, to **J. WATTS,** Stratton, Dorchester, Dorset.

GARDENER (SECOND).—Age 23; eight years' experience in all branches of the profession. Good references as to character and ability.—**H. T.,** Fern Cottage, Lower Road, Richmond, Surrey.

GARDENER (UNDER).—Age 23, single; nine years' experience. Bothy preferred. Good reference.—**B. PHILLIPS,** Himley Hall Gardens, near Dudley.

GARDENER (UNDER), age 20.—**W. G. HAZELL,** wishes to recommend a young Man as above.—The Gardens, Caterham Court, Surrey.

GARDENER (UNDER), in the Houses preferred.—Age 22; fair knowledge of Stove and Greenhouse Plants, &c.—**A. B.,** Post-office, Uffculme, Devon.

GARDENER, or STEWARD and GARDENER.—**ROBERT BURNS,** for the last fourteen and a half years with J. L. Naper, Esq., of Loughcrew, Oldcastle, County Meath, and previously twelve years with Sir Charles Isham, Bart., Lamport Hall, Northampton, is open to treat with any Lady or Gentleman requiring a thorough practical Gardener; has had experience in Farm Work and Forestry, and could undertake the General Superintendance of a large Demesne.—The Gardens, Loughcrew, Oldcastle, County Meath.

GARDENER (UNDER), or good JOURNEYMAN, in a Gentleman's Garden.—Age 21. Bothy preferred. Good character from present and previous employers.—**C. M.,** The Gardens, Hindlip Hall, Worcester.

FOREMAN, or good SECOND (INDOORS), in a Nobleman's or Gentleman's Establishment.—Age 25; well up in Plants and Forcing. Eight years' good reference from previous and present situation.—**G. E.,** Norton, Daventry, Northamptonshire.

FOREMAN, in a Nobleman's or Gentleman's Establishment.—Age 24; good experience. First-class references.—**G. T.,** The Gardener's, Well Vale, Alford, Lincolnshire.

FOREMAN, in a Nobleman's or Gentleman's Establishment.—Age 24; nine years' good experience. First-class references.—Apply, with particulars, to **M. B.,** 37, Barrow Hill Road, St. John's Wood, London, N.W.

FOREMAN, in a Gentleman's Garden.—Age 24; has a good general knowledge of the profession; can take Charge of the Houses. Three years' good character.—**W. C.,** Post-office, Wood Green, N.

To Nurserymen.
FOREMAN (GENERAL, INDOORS), where a brick and continual trade has to be supplied.—**A. B.,** Eslington Street, Grassendale, near Liverpool.

JOURNEYMAN, in a good Establishment.—Age 22. Good references. Fruit department preferred.—**A. B.,** The Gardens, Belton House, Grantham, Lincolnshire.

JOURNEYMAN, in a Nobleman's or Gentleman's Establishment.—Age 21. Good reference.—**E. SAIT,** The Gardens, High Canons, near Barnet, Herts.

JOURNEYMAN, in a good Establishment.—Age 21; fair knowledge of Pines, Vines, Peaches, &c. Two years' good character from last situation.—**W. H.,** 18, Stanford Road, Fulham, S.W.

PROPAGATOR and GROWER (SOFT-WOODEN), for Exhibition or Market.—First-class references.—**A. B.,** 435, Edgware Road, London, W.

PROPAGATOR (INDOOR).—Young; good experience. First-class references.—**E. B.,** 7½, Eterly Street, Stanwix, Carlisle.

To Nurserymen.
PROPAGATOR (HARD and SOFT-WOODEN).—Understands Stove and Greenhouse Plants, Roses, Rhododendrons, Conifers. Ten years' good character from last situation, Lucombe, Pines & Co.—**SAMUEL POPE,** Pinck's Cottages, Alington Road, St. Thomas, Exeter.

IMPROVER, in a good Market Nursery; propagating Houses preferred.—Age 20; good Trade experience, Potting, Tying, &c.—**ALPHA,** 11, Winslade Road, Upper Clapton.

SHOPMAN (HEAD, or TRAVELLER.—Age 34; considerable experience in the Seed Trade; accustomed to the Road. Good address. Good references.—**A. Z.,** 18, Percival Street, Hardwick Green, Manchester.

SHOPMAN.—A young Man; can give exceptional references from first-class wholesale and retail Houses.—**D.,** *Gardeners' Chronicle* Office, W.C.

SHOPMAN.—Age 22; knowledge of Plants and general Nursery Stock; eight years' experience.—**HLEX,** Mr. Morgan, Arthur Villas, Grove Road, Walthamstow, London.

SHOPMAN (SECOND).—A young Man who has a thorough knowledge of the Business in all its branches. Good references.—**S. S.,** *Gardeners' Chronicle* Office, W.C.

SHOPMAN (ASSISTANT).—Age 21; five years' experience. Good reference.—**C. D. E.,** 71, Nethergate, Dundee, N.B.

SHOPMAN (ASSISTANT).—Age 19; four years' experience. Good references.—**W. WEBSTER,** Rose Villas, Wavertree, near Liverpool.

KINAHAN'S LL WHISKY.
 Universally recommended by the Medical Profession. A pure old spirit, mild, mellow, delicious, and most wholesome. Dr. Hassall says, "The samples were soft and mellow to the taste, aromatic and ethereal to the smell. The Whisky must be pronounced to be pure, well-matured, and of very excellent quality."—Wholesale: 20, Great Titchfield Street, London, W.

DINNEFORD'S FLUID MAGNESIA.
 The best remedy for ACIDITY of the STOMACH, HEARTBURN, HEADACHE, GOUT, and INDIGESTION; and the safest aperient for delicate Constitutions, Ladies, Children, and Infants.
DINNEFORD AND CO.,
 172, New Bond Street, London, and all Chemists.

HOLLOWAY'S PILLS and OINTMENT.
 The nerves become much strained during summer, and persons of weak and feeble constitution require some restoring medicine, such as these celebrated Pills, which will be found admirably adapted to correct this weakening influence. Holloway's remedies impart to the whole nervous system a vigour and power which are often sadly deficient by reason of excesses and other debilitating causes. The nervous system is the source of all mental and bodily vigour, and when that is weakened the whole system feels the effect of it; it is therefore impossible to over-estimate the value of any remedy which braces the nerves, as on them depend so much of the comfort and happiness of mankind in every respect.

SOLE MEDALLISTS

For the Best Hot-water Apparatus at the United States Centennial International Exhibition, Philadelphia.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

WRIGHT'S ENDLESS-FLAME-IMPACT HOT-WATER BOILERS.

Guaranteed the most Powerful, the most Rapid, the most Economical, the Simplest, and the Cheapest in the World.

"The 'Boiler of the Future:' I have no doubt about this."—WM. THOMPSON, Tweed Vineyards.

Our Patent Endless-Flame-Impact Boilers have excited a very great degree of interest, not only in this country, but also in Austria, Germany, Holland, Belgium, France, United States, &c.—from all of which we have had many inquiries. We feel sure the details of the experiences of the first ones put to work will be read with interest:—

"The Gardens, Carhead, Crosshills, Leeds,
April 4, 1877.

"To WILLIAM WRIGHT & Co., Airdrie (N.B.).

"GENTLEMEN,—I received your 3 A Boiler on March 19, and with having to wait for castings to connect with it, has caused some delay in getting it started. You do not send any directions for erecting, but I had no difficulty in putting it together. We can only put half the amount of fire in yours that we could into the old Boiler, yet we get as much heat, and far more steady and regular. I think yours an excellent invention.—I am, yours truly,
"W. MEED."

"The Grange, Hooton, near Chester,
July 2, 1877.

"Messrs. WM. WRIGHT & Co., Airdrie (N.B.).

"GENTLEMEN,—I have now had several months' experience of your Boiler, and feel bound to say that the longer I work it the better I like it. It is in fact everything that can be desired as a thorough and efficient Heating Apparatus, and it combines these good qualities with such a small consumption of fuel that it appears marvellous to get such an abundance of power for so comparatively slight expense in fuel. Of course the time and trouble in stoking is correspondingly reduced. Another good feature in your Boiler is its extraordinary rapidity in heating; it is unapproached by any of the numerous other Boilers I have had to do with, and in this respect of speed my verdict upon it must be '*Eclipse first; the rest nowhere.*' Regarding its staying powers I can 'bank up' at 9 or 10 o'clock in the evening, and find all right at 6 or 7 o'clock next morning, with not more than a few degrees of variation during the whole night. I think, with Mr. Clark, that horticulturists are under the greatest obligation to you for placing in their hands so capital an apparatus, founded upon so excellent principles, carried out so thoroughly and successfully, and yet so astonishingly simple and handy, every part calculated at once to work well, wear well, and be quickly and easily repaired in the event of any accident. Then there is none of that constant humbugging with smutty flues; we push the soot down from section to section into the fire and burn it all up. I shall have great pleasure in showing it to anyone who may be interested in such matters.—I am, Gentlemen, your obedient Servant,
(Signed) "WM. EDGE."

P.S. Mr. Walford's is now at work. Like our own a great success. Mr. Walford is very much pleased with it. He says "*it is a wonderful invention.*"—W. E.

"Hope Nursery, Boston, June 1, 1877.

"Messrs. WILLIAM WRIGHT & Co., Airdrie (N.B.).

"DEAR SIR,—Enclosed is cheque for the amount of your account for Boiler, &c., which I trust you will find correct, and at the same time I beg to congratulate you on the success you have attained in giving the gardening world a Boiler of such immense advantages over any other Boiler I have ever before had to do with. I shall certainly, if spared, require another from you in August. . . .—I remain, Dear Sirs, your obedient servant,
(Signed) "T. B. DOLBY."

"The Cloisters, Ruthin, North Wales,
May 23, 1877.

"Messrs. W. WRIGHT & Co., Airdrie, Scotland.

"GENTLEMEN,—I have put up your No. 1 Boiler in a small greenhouse. I beg to state that it is most satisfactory in every way; it consumes very little coal, and will burn any rubbish.

I consider the price of Boiler, pipes, and erecting the same very moderate. I shall have pleasure in showing it, and recommending it to all my friends.—I am, faithfully yours,
(Signed) "J. BULKELEY JONES."

"Silcoates Nursery, Wakefield, Yorkshire,
May 31, 1877.

"Messrs. W. WRIGHT & Co., Airdrie (N.B.).

"GENTLEMEN,—The Boiler erected by you in my propagating house, which is 66 feet long, is doing its work to my entire satisfaction.

"I shall have great pleasure in showing it in operation; and I feel satisfied that the time is not far distant when it will be universally used because of its ability and economy.

"Yours respectfully,
(Signed) "WM. L. SKINNER,
"Nursery and Seedsman."

"Victoria Nursery, Balmoral, Belfast,
May 15, 1877.

"Messrs. WRIGHT & Co., Airdrie, Scotland.

"GENTLEMEN,—Having been constantly working the "A" Boiler you sent me since the beginning of March last, I am now in a position to state that my experience of it is that it is one of the best Boilers I have ever used. It is a steady heater; fires last long with it; and the consumption of fuel (of which I kept an accurate account), is not half that of the common class. It takes up little space; is easily put together; and has so good a draught that it burns up everything combustible put into it. I consider your principles sound; and your Boiler has proved most satisfactory.—I am, Gentlemen, yours truly,
(Signed) "JOHN BOYLE."

P.S. We use slack (dross) and cinders. I am certain I could take it down and put it up again within half an hour.—J. B.

"East Wickham and Bell Grove Nurseries,
Welling, Kent, June 14, 1877.

"Messrs. WM. WRIGHT & Co.

"GENTLEMEN,—Herewith enclosed I beg to hand you cheque in settlement of account for Boiler which please to acknowledge.

"I have now the pleasure to inform you that the Boiler has been tried twice, and so far has proved very satisfactory. At present I have only about 1000 feet of 4-in. piping connected to Boiler, which it heated in a very short time with a small consumption of fuel. The return pipe close to Boiler was as hot as the flow; in fact the pipes were all hot alike. The draught is so great in the one I have that soon after the fire was lighted, although everything was damp, the fire was soon at a white heat. With such a draught it will burn any kind of rubbish. When I start fires again I will measure the fuel and time it, and if I have then the same high opinion of it as I have at present I shall require one that will heat about 7000 feet of 4-in. piping. I shall be pleased to show the Boiler to any one that would like to see it if they call at my Nurseries.—I am, yours faithfully,
"JOHN TURTLE."

"43, High Street, Boston, June 15, 1877.

"Messrs. WM. WRIGHT & Co., Airdrie (N.B.).

"GENTLEMEN,—The Boiler you sent us is giving great satisfaction.—Yours truly,
(Signed) "C. T. AND H. T. WRIGHT."

"Hawthornden, Willaston, near Chester,
July 19 1877.

"DEAR SIR,— . . . I feel it my duty to the Boiler to tell you that it does its work to my thorough satisfaction and seems to have a wonderful digestion.—Yours truly,
(Signed) "ARTHUR S. WALFORD."

"The Gardens, Kenmure Castle, New Galloway,
June 5, 1877.

"Messrs. WM. WRIGHT & Co.

"GENTLEMEN,—As we were making additions to our hot-houses early in spring, rather than have another fire we decided to put in a larger Boiler, and as I was anxious to have a trial of your one I got my desire gratified, and after three months' trial, and that during some very cold weather, I am now in a position to state more fully its capabilities for work. During the whole time I have not had the least difficulty in keeping up plenty of heat, and that with a very moderate fire. I find your Boiler very easy kept going with fuel, and that of a very inferior description from what we had to use with the old saddle one (that I attribute to the excellent draught it has). The attention is also a good deal less, with little refuse or soot about it. It is of admirable construction, affording the greatest facilities in case of accident. The replacing of a section is a mere trifle compared to having to put in a new Boiler. Altogether, I have not the least hesitation in saying your Boiler is a great improvement on any I have yet seen or tried.—I am, Gentlemen, yours truly,
"THOMAS DUFF."

"Windy Bank Terrace, Littlebo',
June 13, 1877.

"Messrs. WM. WRIGHT & Co., Airdrie (N.B.)

"GENTLEMEN,— . . . Sorry to say I had but poor faith in your Boiler at first, but I am now of opinion that it will become a *great favourite* here. It is giving us great satisfaction. I think it is as Mr. Lewin says, "*the dirtiest rubbish seems to suit it best.*" I shall be happy to show it to gardeners and others interested who may wish to inspect it.—I am, Gentlemen, yours respectfully,
(Signed) "J. LAW."

"Mains, Thornhebank, June 8, 1877.

"Messrs. WM. WRIGHT & Co., Hotwater Engineers, Airdrie.

"DEAR SIR,—I have been mostly from home since the Hotwater Apparatus was erected here, but I learn from the gardener that he is well pleased with it. I have therefore made up my mind to use it for a new house that I intend erecting this season.—Yours truly,
(Signed) "JOHN DENHOLM, Jun."

"Black Hall, Ivybridge, August 6, 1877.

"Messrs. W. WRIGHT & Co., Airdrie (N.B.).

"DEAR SIR,— . . . A grand point in yours is the lofty bottom section. I have been working it at slow speed since put up. I tell my employer it is like a high-spirited horse and wants a tight rein. I am highly pleased with it.—I am, dear Sirs, yours very truly,
(Signed) "D. ADAMS."

We may also say that the Boilers' performances have even exceeded our own expectations, great as these were, as many of the points, correct enough in appearance in theory, had to be tried in actual work before their value could be fully known. In practice, however, our conclusions have been borne out in the most complete and satisfactory manner; and we have now no hesitation in saying that for power, speed, economy, simplicity, cheapness, and general adaptability, our PATENT ENDLESS-FLAME-IMPACT stands unrivalled amongst Hot-Water Boilers.

For details and particulars as to the various sizes made, and prices, please see our pamphlet, entitled, "Our Boilers and Heating," which will be handed to all applicants, post-free.

We are prepared to supply THIRTY DIFFERENT BOILERS of all powers, sizes, and heights, and can vary these to suit any particular situation or requirement. BOILERS SPECIALLY DESIGNED FOR LOW AND OTHER INCONVENIENT POSITION.

On view the morning of Sale, and Catalogues had.

MR. J. C. STEVENS has received instructions to SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY, August 29, at half past 12 o'clock precisely, a quantity of PLANTS for TABLE DECORATION, &c., comprising the following:—

- Aralia filicifolia, „ gracillina, „ elegantissima, Calamus asperinus, Cocos Weddelliana, Croton Andraeanum, Geonoma princeps, Kentia gracilis, „ Lindenii, Livistone Hoogendorpi, Pandanus Pancheri, Pritchardia nilifera, &c., &c., &c.

On view the morning of Sale, and Catalogues had.

Dutch Flower Roots.

MESSRS. PROTHEROE and MORRIS beg to announce that their first SALE of selected HYACINTHS for Glasses and Borders, also of TULIPS, CROCUS, NARCISSUS, SNOWDROPS, and other BULBS from Holland will take place in the large Estate Rooms at the Mart, Tokenhouse Yard, London, E.C., on MONDAY, September 10, at half-past 11 o'clock precisely. The lots will be arranged to suit the trade and private buyers. Catalogues may be had at 98, Gracechurch Street, E.C.

Cheadle, near Manchester.

CAPES, DUNN, and PILCHER have received instructions from the Executor of the late Mrs. Douglas, to SELL by AUCTION on SATURDAY, September 8, commencing at 12 o'clock, at the Gardens of "Brunwood," Cheadle, near Manchester; the extensive and splendid COLLECTION of CHOICE EXOTIC and GREENHOUSE PLANTS, comprising 27 large Camellias, well set with flower buds; 24 large Azaleas; a selection of Orchids, including a fine plant of Cologney cristata, Peristeria elata, Cypripediums, and others; several fine Tree Ferns; a good assortment of Stove Ferns; Plants of beautiful ornamental foliage; half-specimen Ericas; 20 Yucca filamentosa; 15 large specimen Liliun lancifolium and auratum; and a large miscellaneous Collection of Hard and Soft-wooded Plants.

May be viewed on Saturday, September 1, and throughout the following week. Catalogues will be forwarded on application to the Auctioneers, 8, Clarence Street, Manchester.

Ember Nursery, Thames Ditton.

By order of the Executors of the late Mr. J. Lewis. TO BE DISPOSED OF, on easy terms, the thoroughly genuine BUSINESS, connected with this old established Nursery. The Nursery comprises Dwelling House, about 9 acres of first-class Land, fully stocked, and about 11,500 feet super of moderate glass, well set with flower buds. Rent £75 per annum. Greenhouses belonging to tenant and also the indoor stock and utensils in trade to be taken by valuation.

N.B. To facilitate the disposal of the Business, it is proposed to effect an AUCTION SALE of the whole of the valuable OUT-DOOR STOCK, thus giving the Purchaser the opportunity of buying at a cheap rate what stock he might require to carry on the business.

Particulars to be obtained only of PROTHEROE and MORRIS, Horticultural Agents, 98, Gracechurch Street, E.C.

To Nurserymen and Others.

TO BE DISPOSED OF, one of the oldest established NURSERY BUSINESSES in the North of England, with valuable connection.

The executors of the late Mr. John Harrison, of the North of England Nurseries, Catterick Bridge and Scorton, are open to treat with a gentleman possessing capital, for the disposal of the business, which has an established connection of nearly 50 years.

The Nurseries consist of about 60 acres of Freshold Land, about 40 acres of which are stocked with a choice Collection of Roses and General Nursery Stock. There are good Residences in the Grounds, and fine Ranges of Glass, close to the Catterick Bridge Station of the North-Eastern Railway, situate between Darlington and Richmond, and offering unusual facilities for doing a large and profitable business. A large portion of the purchase money should remain on security of the property at a reasonable rate of interest. Possession could be given at any time as a going concern. Principals or their Solicitors only may apply to the undersigned.

A. E. HARRISON, Solicitor, Church Yard, Rotherham.

To Florists.

The Owner of a Square in the South of London is willing TO LET, the CENTRE ENCLOSURE, on advantage as terms, to a Florist who will keep the same in tasteful order. There is also a Small Residence, with extra Land for Forcing Pits, and a fair demand for Flowers, Plants, and Gardening.

Apply to WARING and NICHOLSON, Architects and Surveyors, 53, Parliament Street, Westminster, S.W.

To the Trade.

HYMENOPHYLLUM TUNBRIDGE-ENSIS, nice tufts, in 4-inch pots, 18s. per dozen. STATICE HALFORDII, 4-inch pots, 9s. per dozen. ARBORESCENS, 4-inch pots, 9s. per dozen. DRACENA INDIVISA, nice young plants, 9s. per dozen. RODGER McCLELLAND and CO., 64, Hill Street, Newry.

THE IMPROVEMENT OF LANDED ESTATES,

By DRAINAGE, ENCLOSING, CLEARING, and the ERECTION of FARM BUILDINGS and COTTAGES.

The Land, Loan and Enfranchisement Co.

(Incorporated by Special Act of Parliament)

ADVANCES MONEY:

1st.—To the OWNERS of SETTLED and OTHER ESTATES, for the Erection of Farm Buildings and Cottages, and for the Drainage, Irrigation, Enclosing, Clearing and General Improvement of Landed Property in any part of the United Kingdom.

2d.—To the OWNERS of SETTLED ESTATES in ENGLAND, for the Erection or Completion of Mansions, Stables, and Outbuildings.

3d.—To LANDOWNERS generally, to enable them to subscribe for Shares in Companies for the Construction of Railways and Navigable Canals, which will beneficially affect their Estates.

4th.—To INCUMBENTS, for the Improvement of their Glebe Lands, by Drainage, and the Erection of Farm Buildings and Cottages.

5th.—To COPYHOLDERS, for the Enfranchisement of Copyhold Lands.

The amount borrowed, with the expenses, would be charged on the Estate benefited, and repaid by a rent-charge, terminating in twenty-five years.

No Investigation of the Landowner's Title is necessary. Forms of application, and all further particulars may be obtained of

Messrs. RAWLENC and SQUAREY, 23, Great George Street, Westminster, S.W., and Salisbury; of Messrs. ASHURST, MORRIS, CRISP, and CO., 6, Old Jewry, London, E.C.; of Messrs. GILLESPIE and PATERSON, W.S., 81a, George Street, Edinburgh, Agents for the Company in Scotland; and at the Offices of the Company, as below.

T. PAIN, Managing Director. EDWIN GARROD, Secretary.

Land, Loan, and Enfranchisement Company, 22, Great George Street, Westminster, S.W.

Holland.—Wholesale CATALOGUE of DUTCH BULBS, now ready, will be sent post-free on application. C. G. VAN TUBERGEN has a quantity of fine fresh SEED of the magnificent LILIUM GIGANTEUM, which he now offers to the Trade at the following low prices, viz.:—In Packages of 100 Seeds, 1s. 3d.; 500 Seeds, 5s.; 1000 Seeds, 8s. 4d. Orders may be sent to his Agents,

Messrs R. SILBERRAD and SON, 5, Harp Lane, Great Tower Street, London, E.C., who will also forward Catalogues on application.

GEO. WHEELER, NURSERYMAN, SEEDS-

MAN and FLORIST, Warmistur, Wilts. CALCEOLARIA.—Geo. Wheeler's Superb Strain, being in habit very compact, stout, and dwarf, of great variety in colour, and beautifully marked. Is inferior to none. Retail packets, 2s. 6d., 1s. 6d. and 1s. each. Trade packets, 21s. to 5s. each. G. W. distributed his first raised hybrid Calceolaria in 1830, at 21s. each in trade; and in 1832 supplied many sorts of 6 plants each to the trade at 42s. the set. IMPERIAL CABBAGE.—G. Wheeler's Improved Genuine, after a test of about half a century, still maintains its character of first-rate Early. A limited quantity still on hand at the rate of 1s. 2d. per ounce.

Prepaid Orders for the above will be sent post-free.

ROSES. CRANSTON'S NURSERIES KING'S ACRE, HEREFORD.

(ESTABLISHED 1785.)

THE LARGEST ROSE GARDENS IN ENGLAND.

MESSRS. CRANSTON & Co.

Beg to announce that their ROSES (extending over many acres) are now in full bloom.

As considerable time will be required to inspect the whole of their Collection, Visitors to the Nurseries should take the morning trains arriving at Barr's Court, or Barton Stations, 2½ miles from the Nurseries, where conveyances are to be had.

Rose Blooms for Decoration supplied.

STRAWBERRY PLANTS.—Purchasers' selection from Fifty-five of the best sorts known. For LIST see large Advertisement in Gardeners' Chronicle, August 11. 3s. 6d. per 100, our selection; 2s. 6d. per 100, 20s. per 1000, all true to name.

HARRISON'S MUSK, 2 plants 1s., 12 for 3s. 6d. PRIMULA SINENSIS FIMBRIATA, of a splendid strain, 2s. per dozen.

WILLIAM CLIBRAN and SON, The Oldfield Nurseries, Altrincham.

My 700 Varieties of

PELARGONIUMS, now a grand sight, same with VERBENAS, PETUNIAS, FUCHSIAS, LOBELIAS, ANTIRRHINUMS, PANSIES, VIOLAS, ROSES, &c., now in full bloom—in fact, the whole Nursery is highly interesting, and will continue so throughout the season, as all the choicest Florist Flowers are under the most careful cultivation, and all lovers of the same are invited.

Harrison's Musk.

H. CANNELL begs to assure the Public generally that the above now creates quite a sensation in Covent Garden—in fact, there is quite a mania for it, probably a more saleable and profitable was never sent out. H. C. will send two plants, post-free, for 1s., 20s. per 100.

Seedlings.

H. CANNELL begs to announce that he has many thousands of PRIMULAS, CALCEOLARIAS, and CINERARIAS, at 1s. 6d. per dozen. They are now just ready for potting off. All of them are of James' First Prize Exhibition varieties. Special prices for large quantities.

Strawberries all the Year Round.

GARIBALDI (true).

H. CANNELL begs to inform the Public that he has many thousands of the above invaluable variety, established in small 60's, just ready for shifting, 15s. per 100; Plants from Ground, 6s. per 100. From the fact of his being situated in the midst of hundreds of acres of the Kentish Fruit Plantations enables him to offer really all the best and most approved kinds of Strawberries in cultivation. A half-penny card will bring you full and valuable particulars, Swanley, Kent.

New Plants for 1877.

B. S. WILLIAMS' ILLUSTRATED NEW PLANT CATALOGUE for 1877 is now ready, and will be sent, post-free, to all applicants. Victoria and Paradise Nurseries, Upper Holloway, London, N.

A B C Descriptive Bulb Guide.

THOMAS S. WARE has pleasure in announcing that the above for the present season is now ready, containing complete Lists of Lilliums, Narcissus, &c.; also a selection of Terrestrial Orchids, Bamboos and Ornamental Grasses, Climbing and Economic Plants; to which is added an abridged List of Hardy Perennials adapted for autumn planting. Post-free on application. Hale Farm Nurseries, Tottenham, London.

MR. A. VAN GEERT, NURSERYMAN, Ghent, Belgium, begs to offer fine Plants of Budded CAMELLIAS, Indian AZALEAS, Ghent AZALEAS, LATANIAS, CHAMÆROPS, PHENIX and other PALMS, table sizes; also SPIRÆA JAPONICA, fine clumps. Prices on application. The New CATALOGUE, just issued, sent to applicants.

To the Trade.

MESSRS. LEVAVASSEUR and SON, NURSERYMAN, Ussy, Calvados, France, have an immense stock of Seedling FOREST TREES, Hardy Conifers, and other SHRUBS, for transplanting and transplanted several millions of 1-year THORN. Priced CATALOGUES may be had of Messrs R. SILBERRAD and SON, 5, Harp Lane, Great Tower Street, London, E.C.

DUTCH FLOWER ROOTS.

OSBORN & SONS

BEG TO ANNOUNCE THAT THEIR

ANNUAL CATALOGUE OF THE ABOVE

Is now published, and may be had, post-free, on application.

It contains a Choice Selection of HYACINTHS, TULIPS, CROCUS, NARCISSUS, LILIUMS, and various other BULBS; also a Select List of VEGETABLE and FLOWER SEEDS for Autumn Sowing.

THE FULHAM NURSERIES, LONDON, S.W.

NEW STRAWBERRIES.

JAMES VEITCH & SONS

Beg to announce that they are now prepared to execute Orders for the two following Strawberries, which are offered by them for the first time, and which they can with confidence recommend:—

LOXFORD HALL SEEDLING.

Fruit large and handsome, conical, occasionally flattened and Cockscomb shaped, seeds prominent, skin bright crimson, flesh firm, juicy, and exquisitely flavoured. This is a seedling raised by Mr. Douglas, of Loxford Hall, from a cross between British Queen and La Constante, and retains the rich flavour of the former with the sturdy robust growth and fertility of the latter. Awarded First Prizes at the Metropolitan Exhibitions.

9s. per dozen; 60s. per 100.

PIONEER (Laxton).

Fruit medium-sized, obovate and conical, seeds rather prominent, very dark red, flesh firm, bright red, of a fine brisk rich flavour; plant of very vigorous growth, a great cropper, and very early. Received a First-class Certificate from the Royal Horticultural Society.

9s. per dozen; 60s. per 100.

All other kinds also ready in small pots, and runners from open ground.

DESCRIPTIVE PRICE LIST ON APPLICATION.

ROYAL EXOTIC NURSERY, KING'S ROAD, CHELSEA, S.W.

6000 CAMELLIAS. CAMELLIAS, 6000.

HENRY WALTON

Begs most respectfully to call attention to his unrivalled Collection of the above, of all the finest varieties in cultivation, and well set with buds.

These are all English grown plants in the best possible health and vigour.

Price per dozen, from 42s., 63s., 84s., 105s. to 120s., according to size and varieties.
Single Plants from 20s. to 100s.

One very fine specimen of Double White, 9 feet by 9 feet, well set with buds.

Also a very fine Collection of AZALEAS, in 5-inch pots.

Nice bushy heads, full of bloom buds, from 18s., 24s. to 30s. per dozen, according to varieties.

CATALOGUES ON APPLICATION.

SATURDAY, AUGUST 25, 1877.

THE ELM TREE.

THERE is no poetry about this truly serviceable timber tree; and all romance is chased away when we read of the churchyard Elm, when living, or of the coffin boards to which it is converted when cut down. Elm poles are used in vineyards to prop up the Grape Vines; hence we read of the Vine being "wedded to his Elm." We know that few trees or poles will remain sound when buried in the earth, as in the case of gate-posts and the like; but the Elm has given innumerable proofs of its resisting decay when buried, as may be seen when graves are opened twenty or more years after the interment. The wood of the Elm is cross-grained, hard, and unkind to work, but this tough character is not without its advantages, and as the Elm trees grow to a great girth, the boards are eagerly sought after as coffin timber; and when they have butt ends of more than 18 inches in diameter, they become exceedingly valuable for the Government dockyards as wheels for cannon.

The Elm has many peculiarities, and one property possessed by its inner bark is unlike that of any tree with which I am acquainted; for if you rub it in cold water it will give out a colourless "ropy slime," very cooling, and not unlike the lather of soap. It has no end of "vertues" in the Pharmacy of the olden time, and there may be a fortune yet in store for the lucky wight that shall duly incorporate this cooling decoction of Elm bark with toilet soap, instead of some nonsensical combinations we have of—such as "honey soap," with perhaps not a particle of honey in it. Be that as it may, the inner bark of the Elm will maintain its character, and cannot be cried down, for it is truly a simple, and has nothing to do with compounds or quackery.

The Elm is an umbrageous tree, and carries a thick fleece of dark green leaves. It takes kindly to all soils and situations, but its chief merit as a useful and, I may add, an ornamental tree, is its prescriptive right to share, along with the Yew tree, a place in most churchyards. The late A. W. Pugin gave the Elm the place of honour in the case where I planted a churchyard for him. There is a great want of congruity where trees and bushes of various kinds are introduced into graveyards, because there is never room for a wood nor even a shrubby, and the attempt must necessarily be a failure. Let any one imagine a Fir forest with a few Abeles and Lombardy Poplars in the foreground, and flanked with Laburnums, handsome though they be, yet the grandeur of the Fir forest would be gone, for its wealth lays in its dimensions, and in its standing unaided and alone.

In reading up the records of the cathedral church of Manchester, we find that the old churchyard had some trees in it even so late as three or four generations back, and the names of the streets, as Withy Grove, and the like, give colour to the supposition being well-founded. Now, as this churchyard, along with many others, appears to be closed against interments, the happy idea suggested itself to one of our popular Manchester men, to plant the old churchyard with trees and shrubs of various kinds; at all events, to plant the unoccupied spaces, and he did so at his own cost; but

ne sutor ultra crepidam. He had gone beyond his measure, for he should have employed some practical man to prepare the soil first, and then to plant some suitable trees—strong plants, healthy and well grown; but his trees, of some eight or ten sorts, were drawn long and slender, and a clump and some stragglers of Rhododendrons were literally stuck in, and unless better times come both trees and shrubs will disappear—the latter are nearly gone already. Here was the work for the Elm tree, for, being deciduous, it has no leaves to suffer from the smoke for about half the year, which, in the case of the Yew, or, indeed, of any other evergreen tree or shrub, would be the case.

Several letters have appeared in the *Manchester Guardian* on this subject of planting our old churchyard, and all seem to agree about the desirableness of having shady trees instead of cold gray stone; but they differ in their ideas of what constitutes fitness for such a place. Now the grafted kinds of Elm trees known in the nurseries as English Elms grow to a large size, and to sustain such a head of foliage the roots must have a range long and deep. Such Elms as those in Hyde Park must have had a good run. The Elm is a gross feeder, and notoriously a free-growing tree; therefore well fitted to deodorize, and eventually to assimilate the dust and remains of those who have been interred, for assuredly its feeders will find them out.

All trees with resinous sap are unfit for churchyard work, if we except the Yew and the deciduous Cypress (*Taxodium distichum*), and, therefore, the choice in our case lies between the various trees with watery sap, for we must discard all hope of growing either Yew or Cypress. There is really a notable space in our churchyard unemployed, that could be converted at little cost into a place for trees that would give shade, and harmonise with the venerable pile. The Elm is a long-lived tree, and, once planted, would hold its ground for many years, but the Poplars recommended by some are short-lived and "variable as the shade by the smooth shining Aspen made." This tremulous motion is common to all Poplars, on account of the peculiarity in the footstalk of the leaf, whereas the Elm has the leaves in two rows upon the twigs, like an immense pinnate leaf, scarcely stirred by the wind; it is, moreover, beautifully crimped and stiff, as if got up for holiday business, whereas the Poplar leaf is large, coarse and plain, and, however profitable it may be planted in a swamp or on fat ground, the Elm has all the advantages of ancient usage in its favour. Now, if we reckon upon only six Elms attaining timber size, and ample shade, it will be well to plant twelve trees; but, to make doubly sure and guard against accidents, let us prepare twenty pits, each containing a cubic yard of space, and let these be filled with fresh soil and well-rotted horse-dung in equal parts, so as to give the plants some food to start with. This, indeed, will only be like a "tub to the whale," so that it will be well to remove also the clay, gravel, and sooty surface soil, where it can conveniently be done, as it is utterly impossible to get the large trees wanted here, unless they are proportionately well fed.

Our case here is by no means a singular one, for we see graveyards closed everywhere, and no attempt made to make the sites seemly; but surely something might be done with this "garden enclosed" with a fence of heavy iron, and hewn stone, with gates and bars to keep out intruders.

Of all the wealth left by the generations that have gone before us, surely some crumbs might be spared, if not to build tombs and monuments, at least to dress and keep, and even decently to ornament these ancient places

of sepulture. There need be no clashing of creeds in this affair for

"There in peace the ashes mix
Of those that once were foes."

In localities where choice shrubs and trees will grow great diversity of plants might be got, but I am writing for an extreme case where a serious blunder has been made in sticking in—for I cannot call it planting—plants all over the old churchyard of Manchester. The place was worthy of better things, and if the plants and trees had a foul atmosphere to contend with, surely that had nothing to do with planting many of them in clay and boulder stones. I never heard of Elm trees failing to grow in good soil when planted in seasonable time, but they need not be tiny plants wanting stakes to prop them, or tree guards to keep cattle, &c., away from them, for I have planted both Elms and Sycamores, when the bole of each was 3 inches in diameter, and both roots and branches had to be cut back, yet after all this mutilating they did well. It is humiliating to see in the very heart of Manchester, with all its wealth and influence, and with all the recent revivals of religious thought, the baldness of the enclosure about the Cathedral; and I am afraid that it may go forth to the world that as this miserable attempt at planting has failed, that nothing further can be done. We read of an Indian maid dressing the grave of her lover slain in battle—

"That shining from the sweet south-west,
The sunbeams may rejoice his rest."

It is a great blessing and highly prized to have the hope of Christian burial in consecrated ground, whilst thousands slain in battle have their bones bleached in the sun after defending their country and richly deserving a better fate. What a death roll will that be when the sea shall give up her dead? These examples ought to show us the benefit of a final resting-place in our own churchyards where many a summer sun may shine upon our graves. *Alex. Forsyth.*

New Garden Plants.

SEMPERVIVUM (DIOPOGON) REGINÆ-AMALÆ,
*Heed, et Sart.**

This is one of the handsomest of all the hardy Houseleeks. It has rosettes and leaves as large and of the same shape as those of *S. tectorum*, but tinted in the exposed upper half with a rich purple-brown. In flower it is totally different from *tectorum*, as it belongs to the same subgenus (*Diopogon*) as *hirtum* and *soboliferum*, which is marked by having the parts in sixes or sevens instead of twelves to fourteens, and pale yellow petals never spreading stellately. The only notice that I can find of it in print is the mere mention of the name under *S. tectorum* in Boissier's *Flora Orientalis*. It is a native of the mountains of Greece, and was named in compliment to the late Queen. It has been for some time in English gardens, but I have never seen it in flower until, on a recent visit to Mr. Barr's, I was pleased to find that he had it in considerable quantity in a full state of development, and was thus enabled to fit it into its proper botanical position, which is by the side of *S. Heuffelii*, and to draw up the following description.

Rosettes 3—3½ inches in diameter, the new ones crowded by the side of the old ones. Leaves, 100 or more to a rosette, obovate-cuneate, all bright reddish-brown in the upper half, which passes gradually into the green of the lower half, glabrous on the surfaces, densely ciliated on the margins with decurved regular parallel hairs about ¼ line long, the outer ones 12—15 lines long, ½—¾ inch broad above the middle, ¼ inch thick in the middle, the face flat, the back turgid, the naked tip furnished with a horny mucro ½ inch long. Flowering-stem, 4—6 inches long, pale green, clothed with fine spreading hairs, some of which are glandular,

* *Sempervivum (Diopogon) Regina-Amalæ*, Heed, et Sart.—*Rosularum maximarum foliis 100 et ultra obovato-cuneatis distincte cuspidatis dimidio superiore rubro-brunneis dimidio inferiori ovoidibus, faciebus glabris, margine breviter regulariter ciliatis mucrone nudo; caulibus glanduloso-puberulis; foliis caulibus ovato-lanceolatis acutis utrinque puberulis; cymis densis ramis scorpioides recurvatis; floribus inferioribus subsessilibus; calycis campanulati prorsus glanduloso-puberuli segmentis 6—7 lanceolatis; petalis ligulatis ochroleucis utrinque glanduloso-puberulis obtusis obscure tricuspidatis; genitilibus petalis subduplo brevioribus.*

stem-leaves ovate-lanceolate, acute, 1—1½ inch long, tinted brown, slightly glandular-pubescent on both surfaces; inflorescence a dense cyme of about 2 inches in diameter, with 3—4 dense flowered scorpioid recurved branches, all the flowers sessile. Calyx campanulate, ½ inch long, ¼ inch in diameter, glandular-pilose all over, and with the 6—7 lanceolate segments twice as long as the tube. Petals pale yellow, linguulate, obtuse, 5 lines long, obscurely tricuspidate, glandulose-pilose on both surfaces, greenish on the keel outside. Stamens half as long as the petals; filaments greenish-yellow; anthers sub-globose, orange-yellow. Hypogynous scales nearly square, yellowish, with a space between each equal to its own breadth. Carpels as long as the stamens, pale green, pubescent, each narrowed gradually into a short erect style.

SEMPERVIVUM (EUSEMPERVIVUM) GREENII,
*Baker, n. sp.**

This belongs to the *tectorum* group, and is marked in that group by its dwarf habit and very glaucous leaves, with a distinct bright red-brown tip. It is most like *S. calcareum*, Jordan (*S. californicum*, Hort.), reduced in the size of all its parts. My description was drawn up from specimens sent two or three years ago by Mr. Green, of Reigate, and as it is now getting spread widely in English gardens, and I can find no published name to fit it, I give it one, with the reservation that whilst admitting that these marked forms of *Sempervivum* must have names for garden purposes, yet that a large number of them, and this amongst the rest, are only varieties of *tectorum* in a broad sense.

Developed rosettes 1½—2 inches in diameter, the new ones crowded by the side of the old ones. Leaves, 50—60 to a rosette, oblong-cuneate, with a distinct mucro, bright red-brown to a depth of ½—¾ inch at the tip, the rest very glaucous, the faces glabrous, the edge ciliated with regular decurved hairs about ¼ line long, the tip naked. Flowering-stem 4—5 inches long, finely glandulose-pilose, its lanceolate acute leaves hairy on the surfaces. Inflorescence a cymose corymb 1½—2 inches in diameter, of 3—4 scorpioid branches bearing 5—6 flowers each, the lower ones shortly pedicellate. Calyx ½ inch long, densely pilose; segments 11—12, linear, twice as long as the tube. Expanded corolla ½ inch in diameter; petals ¼ inch long, red, densely pilose on the outside. Filaments bright crimson, ¼ inch long; anthers minute globose; carpels as long as the filaments; ovary narrowed suddenly into a divergent style half as long as itself; hypogynous scales minute greenish broader than long. *J. G. Baker.*

"THE VARIED REALMS OF FAIR MENTEITH."

NEITHER the Scotch nor English can now unravel the tangled story of their origin. None can doubt our common parentage, but who can trace his family up to the time of Hengist, or even of Canute? The various new departures of our race—the exodus from Scandinavia and the Norman Conquest—have broken the threads of family history and rendered the longest of our pedigrees comparatively short. A man migrates from his early home and dies, and his sons can only affirm on abstract principles that they ever had a grandfather.

The oldest and "reddest" blood in Britain is that of the Royal family, who are connected, through Jasper Tudor, with the Arthurian house, and with old Cadwallada and Noah, the last-named of whom is said to have landed with his family in a coracle near Snowdonia, during a prevailing flood. No other family in Britain can reach the Flood even by a short cut.

Perhaps the next most ancient family is that of Menteith, whose founders, at the earliest period of Scottish history, wrote their names large in their country's records. Menteith has ceased to be an earldom. The great perish, their titles become extinct or dormant, but happily their places can hardly be obliterated. On the bosom of the Lake of Menteith three small islets are anchored, on which the homestead of twenty departed earls stood for centuries. On Talla, the Hall, the Castle stood, on Inchmahome, the isle of rest, were the burial place and garden, and on a third island was the kennel. All the earls are now reposing on the Isle of Inchmahome, where the best Filberts in Scotland are nourished by her "reddest blood."

The Priory of Inchmahome, which became afterwards an Abbey and then a ruin, was founded by Walter Comyn, of Badenoch, who acquired the

* *Sempervivum (Eusempervivum) Greenii*, Baker, n. sp.—*Rosularum magnitudine mediocri foliis 50—60, oblongo-cuneatis, distincte cuspidatis glaucis apice rubro-brunneis faciebus glabris, margine breviter regulariter ciliatis, mucrone nudo; caulibus glanduloso-pubescentibus; foliis caulibus acutis utrinque pilosis; cymis densis ramis scorpioides 5—6 floris; floribus inferioribus pedicellatis; calycis segmentis 11—12 linearibus glanduloso-puberulis; petalis linearibus rubris stellatis sepalis duplo longioribus; genitilibus petalis paulo brevioribus.*

island and the earldom by marriage with the Countess of Menteith, and died in 1258. The Red Murdoch had been an earlier earl; a later was Walter Stewart, brother of Alexander, the High Steward of Scotland, who also acquired the title by marriage, and who now lies in the nave of the ruined building with his Countess, both having been embodied in marble and carved from the same block 600 years ago.

"The steel-clad Stewart, Red-cross Knight,
Menteith, his countess, fair and bright,
Here lie in sculptured stone."

The correct spelling of the name here written Menteith is Menteith, the valley of the Teith. When Robert Bruce slept at the Priory before the battle of Bannockburn, passing from his castle of Cardross on the Clyde,

"The varied realms of fair Menteith"

were probably a little wilder than at present. In respect to the woodland garniture, or raiment, in which a country may be clothed, the fashion changes from century to century. Rather more than a hundred years ago Nichol Graham of Gartmore, cut his woods on the slopes above the river here, to prevent them from harbouring Jacobites, or such persons as his widely known neighbour Rob Roy McGregor, whose pursuit of cattle lifting he objected to. The woods of Gartmore have been replanted, and generally speaking the scenery of the Highlands has been improved by the large additions which have been lately made to the natural growth of timber. Great families are usually hedged in by their historical associations almost as manifestly as lesser folk are by their shrubberies, and history and old story form elements of the landscape. The long view up the valley from Iochmahome is bounded by the bare flanks of Ben Lomond sheltering the round topped Fairy Hill, of legendary note. In the centre of the valley is Aberfoyle, and beyond the ridge, on the right, are the Trosachs, Loch Katrine, "Benledi's Ridge," and that familiar land of the *Lady of the Lake*, where

"The stag at eve had drunk his fill,
Where danced the moon on Monan's rill,
And deep his midnight lair had made
In lone Glenartney's Hazel shade."

The garden of the Earls of Menteith was on Inchmahome, and we would gladly describe it, but could find no trace of its existence. The Highland proprietors very properly avoid too much artificial decoration as an affront to Nature. The monks planted about the Priory, with their usual good taste, a number of Chestnuts, which are now of great size and beauty, and the home of a colony of rooks. The French Willow herb fringes the edges of the lake and blossoms gorgeously in its season, and a lovely inner edging of flowers is composed of white and yellow Water Lilies all round its shallow shores.

Two smaller sheets of water in Menteith, lochs Con and Ard, are also richly belted with floating Lilies, and bordered by the *Osmunda regalis*. Sir Walter Scott sweetly sings, in the *Lady of the Lake*, of two other plants which flourish here—

"Foxglove and Nightshade side by side,
Emblems of punishment and pride."

And springing freely as they do from the thickly strewn dust of this great family, they might seem the types of error and decadence; but history does not sanction that romantic notion.

On the failure of the heirs male of the Stuart line, the heiress of Menteith married a Graham, or Græme, as Sir Walter Scott sometimes writes the name. "Sir John with the bright sword" of the fifteenth century was one of the most illustrious of his house, and from him the Grahams of Gartmore, the eldest representatives of the family, are descended.

The Stuart blood introduced a royal strain, but we doubt if it improved the stock. Every scientific gardener knows the difficulty of eliminating a strain of sap which he may object to, and the evil consequences of getting his *Geraniums* crossed with the more gorgeous *Pelargoniums*.

The greatest of the more modern earls was the eighteenth, who claimed the crown that Charles I. soon after lost. He was Earl of Strathern and Menteith by inheritance and Earl of Airth by creation, and being a while thrice an earl he became, by lapse of time, food for the Filberts, and aided his ancestors in painting the grass of Iochmahome a deeper green. The Earl's eldest son, Lord Kilpont, did not succeed to the family honours. He was serving in the army

of the Marquis of Montrose when his own vassal, James Stewart of Ardvoirlich, lured him into the fields and disclosed his design of murdering Montrose, entreating the young lord's aid. It was refused, and Stewart stabbed him to the heart and fled to the camp of the covenanter Argyle.

The next and last earl lived in the Castle of Talla, and amused himself, in quieter times, as best he could. On the occasion of a neighbouring laird visiting the Castle, his lordship jokingly inquired if his visitor had seen the sailing Cherry tree, a little tree in full fruit, which a goose bore on its back, having swallowed the stone which produced it. The laird replied that when Oliver Cromwell was at Airth, a trumpeter on the walls of Stirling Castle was sounding a defiant blast, when a cannon-ball of Cromwell's lodged in his trumpet's mouth. "Was the trumpeter killed?" inquired the earl. "No, my lord," said the laird; "he blew the ball back and killed the artilleryman who had fired it."

In a land of genius and wit the smallest jokes are industriously preserved. This last earl committed the catastrophe of dying childless. He joined his ancestors in Inchmahome in 1694, leaving his estates to the Marquis of Montrose, who thus acquired the parish of Aberfoyle, and that large slice of the Rob Roy country which the Lords of Menteith had swayed for many centuries.

The visitors' book at the inn, on the Lake of Menteith, bears witness to the beauty of the scenery which Sir Walter Scott has elsewhere described. One passing poet has inscribed in that interesting volume his name and several verses. "If you want a nice place to bury your grief," he says, "you can't find a better than the Lake of Menteith." Another declares, "There's nothing else but beauty here!" and the next comes adds, "The only want is money!" How clearly that unconscious satire tells the modern curfew which daily extinguishes the shining lights of numerous shallow-pursed, ambitious men, whose want of money condemns them to obscurity. *H. Evershed.*

PLANT PORTRAITS.

ACALYPHA MACROPHYLLA, Hort. Veitch, *Flor. Mag.*, t. 275.—A splendid stove plant with cordate ovate, acuminate leaves of a russet brown colour, blotched with paler spots.

AGAVE SHAWII, *Flor. Mag.*, t. 905.—A species to which we shall in this place simply refer. Its history will be taken up in the monograph of the genus now publishing in our columns.

ALOE CHINENSIS, Baker, *Bot. Mag.*, t. 6301.—A species with tufted habit, lanceolate leaves, toothed at the margin, and tall spikes of pendent orange flowers. It is supposed to be of Chinese origin, and flowered at Kew in the spring of the present year.

ALPINE AURICULA, Silvia, *Floral Mag.*, t. 266. One of Mr. Douglas's seedling Auriculas. The flowers are large of good form, purplish-brown with a yellow centre.

ANTHURIUM ANDREANUM, Linden, *Illustr. Horticult.*, t. 221.—Of this remarkable Aroid, with an orange-red spathe and a yellow spadix, banded with a central broad white stripe, we have spoken of in a former issue.

BORONIA ELATIOR, *Florist*, 1877, p. 145. A new greenhouse shrub of unusual merit; the habit is good, the leaves elegantly pinnately cut into linear segments the flowers numerous in long dense clusters along the ends of the branches. The individual flowers are pendulous globose or bell-shaped, of a rosy carmine colour and very fragrant. Native of West Australia, whence it was introduced by Messrs. Veitch.

CALAMUS ASPERRIMUS BLUME, *Illustr. Horticult.*, t. 273.—A beautiful pinnate-leaved Palm, with linear-lanceolate pinnae. The leaf-stalks and rachides are densely covered with spines. After a certain time it assumes the climbing habit common to the genus. The illustration is taken from a young specimen, and shows well the elegant habit of the plant.

DIRCEA REFULGENS ANOMALA, *Revue Horticult.*, 1877, p. 250.—A handsome Gesneriaceae plant, with soft, velvety leaves, and long, horizontally spreading tubular, two-lipped bright scarlet flowers, spotted at the throat with white spots. In some cases the terminal flower becomes erect and regular, affording an instance of regular peloria, like that of the regular erect *Gloxinias*.

ECHINOCACTUS CYLINDRACEUS, t. 905.—See *Gard. Chron.*, 1877, p. 241, vol. vii.

HAPLOPAPPUS SPINULOSUS, *Bot. Mag.*, t. 6302.—A handsome hardy undershrub or herbaceous perennial, native of the prairies bordering the Rocky Mountains as far south as New Mexico. The leaves are hoary, deeply pinnately cut into linear segments; the flower-heads are an inch or more across, bright golden yellow. The plant was introduced by Messrs. Veitch.

KENTIA LINDENI, *Ill. Hort.*, *Hort. Linden*, t. 276.—A handsome pinnate-leaved Palm of uncertain position. In the young state the pink colour of the unfolding leaves constitutes a great attraction.

LYCASTE LINGUELLA, Rchb. f., *Bot. Mag.*, t. 6303.—A large green-flowered species, described in our columns, 1871, p. 738. It was imported from Peru by Messrs. Veitch.

MESEMBRYANTHEMUM SUTHERLANDI, Hook., *Bot. Mag.*, t. 6299.—A species with oblong-lanceolate recurved leaves, scaberrulous at the edge, flowers 2—2½ inches in diameter, lilac with a yellow centre. Native of Natal.

NEPENTHES AMPULLACEA VAR. *VITTATA MAJOR*, *Illustr. Horticult.*, t. 272.—A variety of a well-known species of *Nepenthes*, having relatively small flask-shaped pitchers, with two fringed wings and a small lid, the pitcher itself elegantly mottled with reddish blotches on a green ground.

NEPENTHES VEITCHII, *Floral Mag.*, t. 265. A very handsome Pitcher-plant with large bold pitchers spotted with red spots, the mouth surrounded by a deeply plicated red rim with a relatively very small lid; the anterior side of the pitcher is traversed by two deeply toothed wings. It is the plant commonly grown as *N. villosa* in gardens, but the true *N. villosa* has yet to be introduced.

ONCIDIUM ZEBRINUM, Rchb. f., *Illustr. Horticult.*, t. 274.—A pretty Oncid with very long racemes (6 feet and upwards), of white flowers transversely barred with reddish violet stripes, the lip is yellow. It is a native of Colombia, whence it was introduced by M. Linden.

RHODODENDRON PARVIFOLIUM, *Gartenflora*, t. 904.—A low-growing species, with small oblong-acute leaves, rusty beneath. The flowers are ¾ inch long, funnel-shaped, of a lilac-pink colour, and disposed in terminal umbels. Native of the mountains of Baikal.

RHODODENDRON GLOIRE DE BELLEVUE, *Revue de l'Horticult. Belge*.—A Ghent seedling, raised by Mr. Vervaeke, and suitable for outdoor work. The flowers are large, apparently of good substance, but rather rough in outline; of a rosy lilac colour, the upper petal spotted with blackish spots.

SALVIA SCHIMPERI, Hook., *Bot. Mag.*, t. 6300.—A woolly-leaved Sage of robust habit, with large white or pink flowers. It was introduced from the mountains of Abyssinia, by Mr. Bull, and is well suited for the back rows of the herbaceous border.

THE PEACH PEAR, *Florist*, July, 1877. A Pear whose proper designation is doubtful. It ripens in August and is of an oblong-obtuse form nearly 3 inches in length, rounded at both ends, both eye and stalk set in shallow depressions. The colour of the skin is greenish-yellow freckled with light brown spots. Flesh melting and juicy.

TULIPA PULCHELLA, *Bot. Mag.*, t. 6304.—A dwarf species, with oblong spatulate acute segments of a beautiful pink colour, with a white spot at the base. The plant was exhibited by the Rev. H. Harpur Crewe.

NEROPHYTA RETINERVIS, *Garten. Flor.*, t. 903.—Already figured in our columns, and in Messrs. Haage & Schmidt's catalogue. The flowers, as here shown, are about 3 inches in diameter, and consist of six lanceolate, violet-coloured segments, spreading widely and supported on slender peduncles.

× *ZYGOPHYLLUM CLAVI*, *Floral Mag.*, t. 267. A fine hybrid, raised by crossing *Z. crinitum* and *Z. maxillare*, the latter being the seed-bearing plant.

MUSHROOM KETCHUP.

A NOTICE of the Mushroom would hardly be complete unless it contained some reference to ketchup, one of the most popular economic products of the fungus tribe. Ketchup, or catsup, as some prefer to spell it, is by no means exclusively made from *A. campestris*. Not only is the Horse Mushroom (*Agaricus arvensis*), to which we shall shortly refer, largely used in its manufacture, but it is stated that almost any species with dark juice is indiscriminately employed. Ketchup made from the Morel (*Morchella esculenta*) is said to be especially

delicious. Mr. Cooke says there is an extensive manufacture of ketchup conducted at Luddenham, near Market Harborough, but the great difficulty appears to be the prevention of decomposition. Messrs. Perkins received tons of Mushrooms from every part of the kingdom, and they find, even in the same species, an immense difference in the quality and quantity of the produce. The price of Mushrooms varies greatly with the season, ranging from a penny to sixpence a pound. Messrs. Perkins are very careful in their selection, but little discrimination is used by manufacturers on a small scale, who use many doubtful species.

The derivation and meaning of the word "ketchup" are unknown, unless we accept Webster's statement that it is probably of East Indian origin, because it meant in the first place a kind of East Indian pickle. A real or supposed Japanese word, "kit-jap," has been thought to throw some light on it; but, in spite of Swift's enumeration of "catsup" as a foreign condiment, it does not appear to be known out of England except as an English export. If, however, "kit-jap" is an Eastern name for soy sauce, as has been stated, it is not difficult to see that it might have been transferred to our English condiment.

The making of ketchup, like most matters connected with the culinary art, is a work requiring some skill and experience. We offer the following instructions on the point, which we borrow from Mrs. Hussey's beautiful *Illustrations of British Mycology*:—

"All kinds of Agaric of which it is proposed to make use should be sound. Decaying larva-eaten flaps are ignorantly preferred; but if the flavour be stronger, it is of a coarse, rank strength, and the smell soon becomes disagreeable—in fact, there is a tendency to putrescence in such Agarics. Cut off the stems, for they possess no flavour, and afford little juice, but much dirt; if the caps are soiled, peel them, do not cut, but break them small, powder every portion with salt, and set the mass in an earthen colander, placed in a bowl. The precise quantity of salt is not of importance, excess is better than defect, it being only needful in cookery to remember that salt is not to be used when ketchup is. After twenty-four hours press the pulp gently down in the colander, all the liquor that thus runs off is to be preserved, and no more, for if you choose to squeeze the rest of the moisture out, although it may be used for any immediate purpose, it is not worth saving. It is a usual complaint that there is so much feculence to get rid of in ketchup; this is owing to the mass of salted pulp being left too long before it is strained, so that the very flesh of the Agaric is melted down into the liquid, instead of its consisting merely of juices extracted from the solid parts. By this maceration there is a gain in bulk; but it is a deceptive gain as to value; the feculence is flavourless, causing fermentation, and pouring off and rebottling is injurious; it is much better to avoid the ketchup ever containing this sediment. The liquor extracted as above, will be a pure fragrant delicious ketchup. Many people would boil this till the aroma had disappeared, under an erroneous notion of 'making it fit to keep,' but to this end the boiling by no means conduces, and almost all Agarics lose their 'bouquet' by the continued action of heat. But how then shall we keep the ketchup? A great deal better! *Probatum est.* And now to divulge the secret. Before the ketchup season comes, procure a quart of spirits of wine in a glass-stoppered bottle, put into this any spices you prefer, in sufficient quantity to flavour the spirit strongly. After the ketchup has been strained off, let it settle twelve hours, then put it in half-pint bottles, fill them up to the shoulder, add the spiced spirit to fill the neck, and cork the bottles tightly and steadily; they must not afterwards be shaken, because the spirit should be left floating at the top to exclude the air, and prevent the formation of that other incipient fungus which cooks call 'mother.' When to be used shake the bottle thoroughly, and put as much of the contents as you like into the waiting soup or gravy; it should not be boiled up in it. The small quantity of spirit is unappreciable in the bulk of ketchup, not affecting the flavour at all. All who try this plan fairly will acknowledge they never tasted ketchup before."

We must apologise both to Mrs. Hussey and our readers for this lengthy extract; but we believe that many of our lady readers will be glad to have a recipe for ketchup making, which is recommended from experience by so excellent an authority. Anyone who has ever tasted ketchup will acknowledge that—judging from results—there must be "more ways than one" of making it; and if that which we have given is only half as good as Mrs. Hussey's concluding observations would lead us to suppose, none of our readers will regret having tried it. *From Britten's "Popular British Fungi."*

A HOLIDAY IN CARNARVON-SHIRE.

THE thirty-second annual meeting of the Cambrian Archaeological Association was held on Monday, August 6, at Carnarvon Castle. Dr. E. A. Freeman, the President, was, by a prior engagement, detained in Somersetshire; he, therefore, did not appear at Carnarvon, and the Doctor, with his coloured ribbon and neck-worn insignia of a "Knight Commander of

FIG. 47.—ORNITHOGALUM LONGIBRACTEATUM, AS-GROWN IN CARNARVON.

the Order of the Redceme" (conferred upon him by the King of the Greeks), was missed by many. The President-Elect, the Right Hon. Lord Clarence Paget, was also obliged to be elsewhere at the time of the meeting; so that two of the chief officers of the Society were unfortunately absent. Under these circumstances

FIG. 48.—A PRE-HISTORIC CUPBOARD AND ERICA TETRALIX.

Mr. C. C. Babington, Professor of Botany at Cambridge, was voted by acclamation into the Presidential chair, Sir Llewelyn Turner being chairman of the committee. Professor Babington delivered an excellent extemporaneous inaugural address, principally descriptive of those pre-historic works of very great antiquity to be found in North Wales. Some of these old structures we shall refer to in greater detail further on in this report. The secretary then read the annual report, which was of a very satisfactory cha-

acter, and referred in favourable terms to the *Lapidarium Wallia*, now being published by Professor Westwood, of Oxford. The latter gentleman then moved the adoption of the report.

On Tuesday, August 7, an excursion was planned for Pwllheli and the pre-historic works of Tre'r- Ceiri. The morning was uncommonly fine and bright, but before the train reached Pwllheli the "atmospheric conditions" had quite changed, for the wind now almost blew a hurricane, the rain descended in torrents, and the mountains were hidden to their bases in heavy clouds. Indeed, matters looked so ominous that only five members out of the whole excursion party would venture to proceed by road; of these five three had to buy new Welsh waterproof overcoats at Pwllheli the writer of these lines was obliged to have a yellow one, which gave him (with his tripod) a diabolical appearance. On the rocky roadsides between here and Llanaelhaearn the rare Welsh Poppy (*Meconopsis cambrica*) could be distinctly made out. The first stoppage was made near the village of Four-Crosses, to examine and sketch the great Cromlech, with its overturned capstone situated on Cromlech Farm: this structure is approached by a long avenue (16 feet wide) of smaller stones embedded in the ground, and one of the side supporting stones of the Cromlech is no less than 10 feet 2½ inches wide. The farmer when he clears his field of stones has them all thrown inside the supporting stones of the Cromlech. The drawings and measurements were made in a heavy downpour of rain. The party of five then drove on to Llanaelhaearn Church, where there is nothing of moment to be seen except the ferns and lichens on the old walls. Adjoining the church is a rude, ill-built and disused old school-room, now a species of a dilapidated barn full of dust and spiders. Over the ruinous mantel-piece of this building, and held in its place by rough iron hooks, is a Romano-British stone, 4 feet 6 inches long, with the following inscription: ALIORIVS ELMETIACO HIC IACET. This stone, which was dug out of a deep hole some 2 or 3 yards deep by the churchyard, should be taken better care of. The schoolroom is at the foot of the triad mountain-group, named Yr Eitl, popularly "The Rivals," the highest of the three peaks being 1368 feet above the sea, the least to the east about 1400 feet, and on the summit of this latter is the early pre-historic fortified town known as Tre'r-Ceiri.

When your correspondent had sketched the inscribed stone, and emerged and looked towards the mountains, nothing was to be seen but clouds, mist, and pouring rain, the hill summit with its ruins being a mile and a half from the village. The ascent was very difficult, if not dangerous, as the party of five had no guide, and not knowing the path, went straight up the face of the mountain: the loose trappean rocks proving sharp as knives, and giving way under every step. The groups of *Saxifraga stellaris*, *Erica Tetralix*, *E. vulgaris*, and *Vaccinium myrtillus*, were always pitfalls, as they merely filled hollows, furnished with the sharpest of stones at bottom and sides. The writer will always have unpleasant remembrances of bruised shins and cut boots in connection with these plants in future. When the summit was reached the rain drove so fiercely in a horizontal direction that it was like being in the swift current of a river, and breathing was almost impossible. Sketching and measuring were almost hopeless; neither of the party of five could see one another, and they only knew of each other's whereabouts by shouts and whistles. Two hasty camera-lucida sketches were made, and it was then determined to pay another visit to Tre'r-Ceiri before the dissolution of the meeting. It is hardly necessary to say that whilst your artist was making his last sketch his four companions (possibly imagining dinner) decamped, and left him in the mist and rain on the hill summit by himself. He descended with his tripod by quite a new path, beginning with a 12 foot rampart, and considerably ripping his yellow waterproof by the way. On driving back to Pwllheli note was made of the magnificent *Hydrangeas* growing in the open garden-beds of the cottages, the great *Fuchsias* covering the cottage fronts to the eaves, and *Lavatera arborea* growing equally well on the rocks and in the gardens; dead sea birds (as divers) were hanging outside many of the cottages, so that the taste of the sea might be dispelled from the flesh before cooking. On driving back to Pwllheli the bad quality of our Welsh horse was also noted, for in place of trotting, the beast capered about in an ornamental fashion, and made very little progress; when moderate chastisement was

applied the caperriogs became more ornamental, but the pace was not increased, and if still further urged the beast stopped, looked round at the driver, and appeared to remonstrate with him. As we could neither drive nor lead our steed, we consequently lost the train to Carnarvon, and as we saw it steaming out of Pwllheli station, all dreams of dinner and the evening meeting vanished. Not so with our driver, for he said we could still catch the train by the time it reached the next station; he, therefore, hurried us into another waggonette which had a fresh horse and driver, and we started at a furious pace by the road skirting Cardigan Bay for Chwillog. But Chwillog was never reached, for when the new horse came to a hill he pretended he could not get up, and we saw the train steam away in advance as before. Archæologists are in one sense always behind the age. We now determined to return again to Pwllheli, there dine, and return to Carnarvon by the late train. For the third time we therefore drove furiously along the road. If the native Cambrians had ever heard the legend of the "Flying Dutchman" they must have thought they saw the veritable Vanderdecken himself, with yellow hair, weather-torn, brimstone-coloured mackintosh

Figs on the walls at Llandwrog and elsewhere, and again, the huge Pelargoniums, Fuchsias, and Hydrangeas in the open beds. We stopped for a few moments at Glynllifon Park, to see a great standing-stone or Maenhir, 9 feet high and 4 feet wide, but the learned treasurer would not allow time for a sketch to be made: the cromlech near Tanybedw was passed unvisited; but a stop was made at Clynngog, where there is a largish inn without a licence. Near here in a meadow running down to Carnarvon Bay is the magnificent Clynngog cromlech, the cap-stone, still in *situ*, displaying on its upper surface the "cup-markings," whose meaning no one at present has been able to unravel. The Cromlech stands 6 feet high, and its cap-stone is 9 feet long; the structure faces Carnarvon Bay, and is backed by high mountains, Tre'r-Ceiri being upon the summit of one. Near here is a "Holy" and "Cursiog" Well (the two combined), dedicated, like the neighbouring church, to a seventh-century saint named Beuno. In the church may be seen a free fragment of the tomb of St. Beuno. The virtues of the well and the saint are now less believed in than formerly, though an old rustic told us he could well

These were hanging on strings, and had an unique and somewhat terrible appearance. These tin cats are made for the use of farmers who hang them with string by the middle to a stake in the centre of a field where they dangle like fishes on a rod, (their legs just touching the ground) to frighten the birds away. These tin feline quadrupeds are painted in a different fashion on the two sides, tabby on one side and black on the other, or white on one side and tortoise shell on the reverse; this, the shopman explained to me is to make the birds think there are two cats prowling round and waiting for birds. There will be a fall in tin cats when "King's Carbolic Dressing" reaches North Wales: at present they are 3s. 6d. each. I should be glad to cut out and paint any number for 1s. 6d. each!

In the afternoon the Rev. E. L. Bramwell arranged that a party of five should cross over the Menai Bridge into Anglesey, and examine the ancient and famous remains at Plas Newydd, the modern seat of the Marquis of Anglesey, now tenanted by the Dowager Lady Willowby de Broke. Not till we reached the park gates did we know that owing to the recent serious illness of her ladyship no visitors were allowed

FIG. 49.—ROCK-WORK WITH A MEANING AT TRE'R-CEIRI.

and sextant, with his selected officers in mad search for the missing enchanted ship.

We breathed the horse at Aberech Church, made a few sketches, and took rubbings of monumental slabs; noticed the gravestones of slate, the Primroses and Oxalis growing with Sedum acre and Asplenium Ruta-muraria on the walls in the village streets, and so had not sufficient time for dinner. We were very late and very wet the first day, and were kept on a siding of the railway for three-quarters of an hour, waiting for a number of people who were taking part in a Congregational meeting at Portmadoc. We should have preferred the Carnarvonshire Congregationalists being shunted for the Cambrian Archæologists.

On Wednesday, August 8, the carriages started at 9.30, so I previously strolled through the town, and noticed the quantity of *Polypodium vulgare* on the walls in the streets, and sketched the Carnarvonshire manner of training *Ornithogalum longibracteatum* (fig. 47). Plants with their leaves so tied up with party-coloured ribbons have a peculiar and Elizabethan appearance. On starting the party soon came within sight of the sea at Carnarvon Bay, and visited several earthworks and strongly fortified places—one of immense size, named Dinas Dinlle, the whole ground now being dotted with *Euphrasia*, and *Erodium*, and ornamented with Fairy Rings, Champignons, and Horse Mushrooms. Noticed the abundant crop of

remember the time when the villagers dipped their children in the well, and then placed them to sleep on the saint's tomb for the cure of certain ailments; the washing might possibly have done some good, but the resting on the stone slab must have counteracted any good arising from the removal of dirt. Scrapings from the pillars of the saint's chapel mixed with water were once said to be good for sore eyes, but no doubt this was superstition. There is an extraordinary old money-chest in the vestry, cut out of a solid block of wood, after the manner of an ancient British canoe. At this village there is a somewhat large tree growing direct from the top of a little porch-roof, and it was here we tried the quality of the large brown loaves of Welsh villages. The bread is baked in a large earthen pan over a peat fire, the top of the pan covered with turf. After the bread is turned out, the pan is used as a domestic vessel for washing, &c. At the evening meeting in Carnarvon Castle, Sir Llewelyn Turner gave a history of the building, and on the following day he devoted six or seven hours to a description (on the spot) of the exterior and interior. Some of the members became weary by mid-day, and your artist amongst the number. He strolled into the town to inquire the use and price of a series of life-size cats made out of sheet-tin, and painted to represent blacks, whites, brindles, tabbies, and tortoise-shells.

on the estate; neither could we prevail on the portress to take or send any message to the house. At this moment the gods favoured us, for whilst we were still parleying, her ladyship drove up, and instantly and very kindly gave the party permission not only to see the great stones, but the house and garden. The two immense Plas Newydd Cromlechs stand close together in a grassy meadow near the stables; they are probably the finest structures of their sort in Wales, and have a most impressive aspect. The capstone of the larger Cromlech is 14 feet long, 11 feet broad, and from 4 to 5 feet in thickness, supported on six upright stones, each stone being about 5 feet out of the earth. About the grounds are many other single stones (one 10 feet across), but whether these were ever parts of similar structures it is now impossible to say. One of your correspondents asked last week how some of the huge stones of Stonehenge were transported "by barbarians 2000 years ago" from Carnarvonshire to Salisbury Plain; but the answer is simple—the stones never were transported by human hands, they were carried by glaciers; the glacier marks are in many places abundant and strongly defined in North Wales. After the upright stones were got into position a mound of earth was probably heaped up to the level of their highest points, and then the capstones were worked up the sides of the mound by rude levers. Very near the mansion at Plas Newydd

is an open Kistvaen (stone grave structure under a tumulus), composed of two end stones, four or five upright side stones, and two large flat cap-stones, the inside (which received the interment) is 7 feet 3 inches long and between 3 and 4 feet wide; the larger of the two cap-stones measures 6 feet 9 inches by 5 feet 10 inches. The whole was at one time entirely covered by an immense mound of loose stones and earth. The mound was opened some time since by Lord Clarence Paget, and it has since been kept open. The foot-stone, 6 feet 10 inches wide, is most curiously drilled with two circular holes—for what purpose it is impossible to say—and all the large stones show traces of being roughly hammered by other stones into rude shapes. The rest of the party could not remain whilst the writer was sketching, so they drove off, and he afterwards walked to Menai Bridge with his three-legged friend in time to catch the 10.10 P.M. train for Carnarvon.

Friday, August 10, was the last day of the meeting, and the one appointed for the renewed visit to Tre'r- Ceiri. It had rained all night, and it poured with rain at the time appointed for starting in the morning. Indeed, the "atmospheric conditions" (which, according to one of your contemporaries, are systematically ignored by the writer of these lines), looked so black that only three Cambrians would venture on the ascent. The yellow waterproof having gone to ribbons, your artist soon got comfortably wet through; this is always refreshing to one who gets "roasted" so much for believing in protoplasm and spores, and insisting on a second position for wireworms and earwigs. On the way to Tre'r-Ceiri, the three men and the tripod turned off at Craig-y-Dinas (a strong post on the Llynfi), to examine and sketch a strong fort with stone walls 5 feet high, and earthworks of the same date as Tre'r-Ceiri itself. In driving through Clynnog the tree was again noticed growing from the porch roof—a Sycamore tree of considerable dimensions. I wondered where the root could be, and determined to sketch it for the *Gardeners' Chronicle* on the way back to Carnarvon. By the time we reached Llanaelhaiarn the weather had cleared, but as our learned and genial (but recalcitrant) treasurer and master was not with us we could not find the proper path, so we once more went "straight up," with more "downs" than "ups," though we now avoided the pitfalls of Erica and Vaccinium. The view of sea and mountain from the top is magnificent, but our special object was to see the pre-historic fortified town of Tre'r-Ceiri—the most perfect in Great Britain. Those most competent to form a right opinion, from correct knowledge and long experience, say the date of the town may safely be placed twenty centuries back, and possibly many centuries further back still; but how far it is impossible to say, for there is no history, manuscript, or date. This town on the mountain-top covers 5 acres; it is enclosed by a wall from 9 to 16 feet thick, and in some places from 12 to 15 feet high; in certain positions the wall forms a parapet 4 feet high, with a flat walk inside on the sharp stones 4 feet wide; the entrances are strongly fortified with long and strong stone ramparts. Of course no cement is used, for our unpleasant forefathers of this uncertain date had few or no manufactures, and probably had not yet learned to chip flints. The remains of the houses, cells, dens, or "cyttiau," are arranged in irregular circular groups; these houses are many in number, and are round or oval in shape with flattened sides; the diameter inside ranges from 8 to 12 feet, and the hut walls are 2 or 3 feet thick. Each hut has an entrance about 2 feet wide, and the pre-historic builders were evidently friendly with each other, for some of the entrances are very close together. The rough and sharp stones are piled on each other with little design, but the surface of the stone with fewest sharp angles is generally placed next to the inside. Roofs there are none; in some instances these may have been formed by large cap-stones, or stones arranged to form a rude dome; but as there are no large stones on Tre'r-Ceiri, the original roofs were probably of tree-branches and skins. These would soon vanish in a hurricane.

I have more than once suggested in the *Gardeners' Chronicle* that certain ancient stone structures might be reproduced with advantage in some of our public gardens or parks for the instruction of the people. In this particular instance some of the huts of Tre'r-Ceiri might easily be reproduced, and they could take the place of some of the meaningless heaps of brick-bats too often seen in public gardens. With the aid of the dimensions I have given, and the accompanying

camera lucida sketch made on the mountain top (fig. 49), no difficulty need be experienced. The stones of the original huts are natural pieces of trap rock with sharp edges, lichen covered, and interspersed with plants peculiar to that position and altitude. If the reproduction of a Japanese village is found interesting and instructive, a lake village or a group of pre-historic houses would, at least, be equally so. The two latter would "lend" themselves particularly well to a garden. No doubt the ancient dwellers in the houses here illustrated had their cattle with them on the mountain top; these they probably killed by means of heavy stones discharged from leathern slings. Water is present in one or two places, and as clouds so commonly cover the top, water is generally to be had in the natural clefts of the rock. The enclosure walls were clearly made to protect the people and the cattle from the attacks of enemies and robbers. The life of these men could have been very little or no better than the life of the beasts they associated with, and one can imagine the death-rate must have been somewhat high during inclement weather and the hurricanes and frosts of autumn and winter. During the latter period the people probably descended the hills into the woods and valleys, for the fear of marauders must have been less during the winter months.

Whilst strolling amongst these 5 acres of ancient human dens I noticed in the wall of one (and only one) the curious recess illustrated in fig. 48; the opening is about 16 inches square, and the same in depth. At first I was inclined to look upon it as a fireplace, but the Rev. E. L. Bramwell informs me it was a cupboard; to me it is unique, and it makes one wonder what rude objects could have been kept in such a cupboard, where the householders had so very few things indeed to keep. The constructor was clearly a more contriving man than his near neighbours, for the latter probably kept their "household gods" on the floor, if they had any. The air being clear, we descended the hill by an easier path, in time (as I thought) to secure a sketch of the Sycamore tree on the porch roof at Clynnog; but the horse (like the horse of the first day) threw his legs about in an ornate fashion without making great progress. The sketch was, therefore, never made, and is lost to your readers for the present. As we reached Clynnog, my two companions, observing my preparations for sketching, exclaimed, "Whip up, driver! whip up!" with such unexpected effect, that I was half a mile on the other side of Clynnog before I could recover from my surprise. *W. G. Smith.*

FULHAM PALACE.

THIS Palace has from a very early period been the summer residence of the Bishops of London. It is of brick, and appears to have undergone considerable alterations since its original construction. The portions which exhibit marks of antiquity were erected by Bishop Fitzjames, in the reign of Henry VII., whose arms are carved on it and on the gateway. The later additions are by Bishops Compton and Bonner. The palace is surrounded by a moat, and the grounds comprise about 37 acres, on which stand some of the finest and rarest trees in the country. Bishop Compton is supposed to have been the principal planter, the additions to the palace were built by him and Bishop Bonner; Bishop Tait erected the beautiful chapel attached to the palace. The present bishop has added a beautiful walk round part of the grounds, and takes a great interest in the old trees, which are carefully supported in their old age.

The approach from Fulham is one of the finest promenades in the neighbourhood of London, and is given up to the public, by whom it is highly appreciated.

The grounds have long been celebrated for their high keeping, and contain many objects of great interest, a few of which I now proceed to enumerate. The fine old Cork tree now going to decay is said to be the first introduced into the country; Juglans nigra, 21 feet in circumference, with a beautiful stem and fine healthy head; Gleditschia macracantha, the finest in the country; Tulip tree, quite 60 feet high, with a fine clean stem; Ailanthus glandulosa, large and very handsome; Cedar of Lebanon, very fine, but encroached upon by an Evergreen Oak; Judas tree very fine, but going to decay, the stem is about 4 feet in diameter; deciduous Cypress, very symmetrical and handsome; Oriental Planes, very fine; several old Acacias, fine Ashes,

stately Elms, Fulham and evergreen Oaks, Catalpas, Chestnuts and Pavia in variety; Acer fraxinifolia, very handsome; Paulownia imperialis; Medlar, very old; Siberian Crab tree, loaded with its beautiful miniature clusters of fruit, together with many other very interesting trees and shrubs.

The moat is hid in a dense thicket of trees which shuts out all surrounding objects, except on the river side, where there is a good view of the Thames. The flower garden is well filled with a choice assortment of the best bedding plants. Several very nice carpet beds, which show taste on the part of the designer, flower-baskets and vases add to the charm of a well-kept lawn. A very interesting walk surrounds the kitchen garden, orchard, and frame-grounds, the houses containing many nice shrubs. I noticed a fine Nettle tree, handsome Bays, and several choice bits of rockery with nice rills of water in them. The orchard is well stocked with fine trees, but unfortunately there is this year no fruit. The frame-ground contains Pine-pits, nice Fernery, plant stove, and several pits and frames. The fruiting Pine-pit is a long lean-to structure. I noticed several nice Queens and a succession-pit full of healthy plants. The plant stove contains nice decorative plants of Dracaenas, Caladiums, Achimenes, Begonias, Crotons, Pandanus, two fine large Ferns, Davallia solida, Polystichum capense, both quite 4 feet through and very healthy. The fernery contains a nice collection of Adiantums, Cheilanthes, Aspleniums, Doodias, Davallias, Hemionitis, Pterises, Lomarias, Lycopodiums, &c., all very healthy. In and about the frames I noticed a well done lot of Chrysanthemums and Lilliums, and a fine lot of Camellias and Azaleas. Two years ago Mr. Henderson had all the soil washed from their roots and the plants placed in smaller pots, which has answered very satisfactorily. I think it is preferable to the ordinary way of reducing the balls by chopping of soil and roots. I noticed several plants of the useful Trachelium coeruleum, with its Statice-like flowers; several frames full of choice Pelargonium cuttings—as this is a very damp locality, they are found to winter better when struck early.

The vineries, Peach, stove and greenhouse form a fine range of glass, and well filled. The early vinery is nearly all cut. The second contains a very heavy crop, and is just beginning to colour. Mr. Henderson is a great advocate for evaporating-troughs for liquid manure; by its use and a succession of young rods he gets great quantities of fruit, preferring bunches of about 2 lb. weight, as the bishop gives most of them away to the charitable institutions round London. The large plant-stove is rather over-done with young Vines carrying their first crop of fruit; plants and fruit together are not generally a success, but there are here lots of useful decorative plants, which are largely required for the town residence during the winter season. The plants consist of Begonias, Dracaenas, Dendrobiums, Eucharises, Franciceas, Rondeletias, Vincas, Ferns, a few nice Anthuriums, a very large Dracaena Draco, &c.

The greenhouse contains several large Azaleas for cutting from, and a nice lot of the ordinary occupants at this time of year. Close by there is a fine Magnolia alba, which covers a considerable space of wall. In front of this range of glass there is a geometrical flower border in gravel, with fine beds of Cannas, edged scarlet Pelargoniums, Featherflew, and Sedums, good beds of Zea japonica variegata, a beautiful bed of the Happy Thought Pelargonium, &c.

In the kitchen garden there is a nice stock of pyramidal fruit trees; Peaches on walls do not do well, the locality being low and damp. There is a beautiful wall of Figs; but, unfortunately, they are on an east aspect. The gardens are well filled with crops of all sorts, and show little traces of the backward season. I noticed a very fine strain of Rhubarb, which Mr. H. has selected for over twenty years.

The offices are all very useful and commodious. The family when in town are regularly supplied with the produce of the farm and gardens, all of which are under the management of Mr. Henderson, to whom I feel deeply indebted for information about this beautiful and historical residence. *Visitor.*

HARDY AQUATIC PLANTS.

DEAR old Gerarde, in his quaint way, thus speaks of the *Butomus umbellatus*:—"The water Gladiole, or Grassie Rush, is of all others the fairest and most pleasant to behold, and serveth very well for the decking and trimming up of houses, because of the beauties thereof." This praise of one of the most lovely of our hardy aquatic plants by such a close observer of Nature was in no way exaggerated, and applies as well now as it did when penned by that worthy sage; for it is a real gem, and should be in

every pond, pool, or piece of water of sufficient extent to contain it. Now that we have the Wilson raft (See p. 101, Vol. VI. 1876), it is to be hoped that both aquatic and semi-aquatic plants will have the attention devoted to them their merits deserve, as, independent of the great beauty of many of them, they are among the most interesting subjects that can be cultivated. One thing struck me when looking at an illustration representing the above-named raft in use, and that was how greatly it might be improved in appearance if the top were raised and covered with vegetation of some kind, so as to represent a miniature floating island, instead of the flat bare timbers showing in the way they do, with only the plants in pots to hide them. This might be done with some of the coarse grasses, a tuft or two of *Carex*, and many other things; but no doubt all this has occurred to Mr. Wilson, and his inventive genius will make the thing perfect.

Except the most spreading, such as some of the Water Lilies, whose leaves rest on its surface, there can be no doubt but that many of our best aquatic plants would be more at home potted in good loam and floated about by means of such a contrivance as that recently brought under notice; and as they could be changed and rearranged at pleasure, I know of nothing calculated to add such a charm to a lake or small pond as a group of such things as the *Butomus umbellatus*, *Menyanthes trifoliata*, *Carex pendula*, *Iris Pseudacorus*, *Calla palustris*, and such like things.

Although the *Butomus* is a native plant, to be met with by the sides of streams and sluggish water-courses, it appears but little known or cultivated, which is to be regretted, considering its great beauty and the length of time it lasts in flower, either on the plant or in a cut state. The finest specimen I ever saw was grown in a pot sunk a few inches below the surface of the water, where, from some cause or other, it did much better than others planted near the banks. This increased strength and vigour was probably owing to the richer nature of the soil, and the greater depth it had to grow in, as from the pond being puddled with clay those near the margin had but little else within their reach. It should be borne in mind, when starting in the cultivation of any of the above class of plants, that to be successful they must have something more than water to feed on, as where they are found naturally there is always a deep deposit of mud containing a good deal of rich vegetable matter, in which their roots ramify in all directions.

The *Butomus umbellatus* admits of ready increase by division, which may be done any time during the spring just after growth commences, as then they quickly start away, and re-establish themselves. The Bog Bean, *Menyanthes trifoliata*, is likewise a most interesting plant to grow, and succeeds well in wet, boggy places, or near the banks of a pond, where it can have a good depth of loose soil and a few inches of water. Of all hardy aquatics, however, none surpass the queenly beauty of *Nymphaea alba*, of which no garden pond or lake should be without one or more groups, according to their dimensions. This lovely Lily does best in about 18 inches or 2 feet deep of water, with a few loads of rough turfy loam and vegetable matter, such as the rakings from a wood containing plenty of decomposed leaves, &c., shot in where it is desired to get it established. In this they thrive amazingly, and increase at a rapid rate; but it is always an easy affair to limit them to any particular space by cutting off their leaves or plucking some of them up round the outer margin, and this should be done so as to break them up into irregular-shaped patches, in which way they look far more picturesque than when the groups are in a circular form, as they generally are when left to spread without any control. Like most other plants, the thinner they are kept the finer the foliage becomes, and the better they flower, and independently, therefore, of confining their growth to certain limits, an occasional thinning-out is highly beneficial, especially in old lakes or ponds where there is generally a large accumulation of mud at the bottom which induces them to send up many more offsets.

For the basins of fountains and small shallow artificial sheets of water, such as are usually connected with hardy ferneries, one of the most beautiful and interesting aquatics that can be introduced is *Aponogeton distachyon*, which, although a native of South Africa, withstands our winters, and soon establishes itself where the conditions are favourable. Where the water is more than a foot or so deep the best way to manage it is to use Seakale pots sunk to about that depth and filled with rough turfy loam and sand in

which to grow the plants. This will bring their leaves sufficiently near the surface, and allow the roots to get through below, and lay hold of any deposit that may have accumulated there. In this unlimited run they become very vigorous, and flower with great freedom, much more so than they do when confined to an ordinary pot, with only a handful or two of soil to feed on. It may not be generally known that the old and highly prized *Richardia æthiopia*, so much used to adorn greenhouses and conservatories is quite hardy, if planted sufficiently deep in water for the crowns of the plants to be about 3 or 4 inches under; but when so managed it is one of the most striking and natural looking things to have for associating with any of those mentioned above. In a pond here we have had them for years, where they produce a capital effect near *Osmundas*, *Gunneras*, *Calamus*, *Carex*, *Bamboos*, *Athyriums*, and such like moisture-loving subjects. J. S.

VICTORIA PARK.

THIS park is now well worth seeing. The trees are in splendid leaf. The second growth here, as in most other places, has been much greater than usual, no doubt as a consequence of the first efforts in leafage being so much checked by the cold weather we had all through the spring. This second growth has also, no doubt, been still further accelerated by the late copious rains which have been sufficient to reach the roots, a somewhat unusual occurrence in this part of the kingdom during the months of July and August. The summer growth on trees that are young and vigorous has been such that in many cases the leaves almost cover the spring foliage, which on trees like the Horse Chestnut and the Planes in exposed situations was much crippled. Evergreens generally get the character of not doing well in the neighbourhood of large towns, especially London, and no doubt this is quite correct so far as most species are concerned, but Hollies are an exception. In this park they have been largely planted in the first instance, and, what is of equal importance, well cared for subsequently by allowing them the sustenance indispensable to free development which is not possible where overcrowding takes place, a condition under which unfortunately the majority of the trees and shrubs in the London parks have suffered, in the case of those long planted to their irreparable injury, and with those introduced in later years the evil is now working out its slow, but nevertheless, certain results. The Hollies here afford an unmistakable illustration of what can be done even in a smoke-charged atmosphere, when they are allowed sufficient space to grow in. It would be difficult to find their equals in any public place; almost all varieties appear to succeed. We noticed a specimen of the seldom seen *Ilex crassifolia*, 12 feet high; and most of the old established varieties are here very much larger than this, dense, closely furnished pyramids, clothed with healthy foliage from top to bottom. The Thorns, of which there is a good assortment, here, as almost invariably where the soil is not too wet, show their ability to thrive and make themselves at home better than most things.

The bedding display is very fine, for notwithstanding the cold weather, which retarded the planting of many things later than usual, the whole of the beds were splendidly furnished by the first week in August. This applies to both flowering and carpet beds. Of the latter Mr. McIntyre has this year designed some of the most pleasing arrangements we have yet seen, much the greater portion of the surface being composed of plants possessing grave subdued hues, with just enough colour interspersed to avoid an over sombre appearance. Those who delight in blazing displays may pronounce some of the beds here too dull, but the artistic eye will instinctively be attracted to, and dwell with pleasure upon them. One in particular, a long narrow scroll about 3 feet in width, has the base or groundwork of *Sedum glaucum*, edged with a double row of small *Echeveria glauca*, between which is a line of *Sempervivum hirtum* (montanum); the centre of the bed is thinly interspersed with small simple figures of colour, composed of different varieties of *Alternanthera* encircled with Golden *Pyrethrum* edged with small *Echeveria glauca*. The circles in this bed have for centres a single plant of *Sempervivum arboretum* or *S. tabuleforme*, and some of the smallest patches are edged with *Mesembryanthemum cordifolium*. Many people who admire this style of bedding are deterred from adopting it, under the im-

pression that it must necessarily entail considerable cost, but the above bed consists of the most simple and inexpensive plants, and is far more elegant than the elaborate combinations often met with, that cost much more in the materials of which they are composed.

As a light green ground colour in carpet bedding nothing equals the free-growing *Pennyroyal* (*Mentha Pulegium gibraltarium*); for a dark green ground the smooth-leaved British Rupture-wort (*Herniaria glabra*) is superior to the Mint. The free-growing capabilities of these two plants, combined with their dense, close-spreading habit, fit them especially for this style of decorative gardening. These and the two *Sedums*, *S. glaucum* and *S. acre aureum*, are unsurpassable. *Alternanthera paronychioides major* is the most effective of all the varieties here. The table-shaped *Sempervivum*, *S. tabuleforme*, is very extensively used and very effective. The large-leaved plants employed in masses are in excellent condition; in these Mr. McIntyre adopts the right course of using nothing that will not grow and look satisfied with the quarters in which it is located, as also in planting such subjects where they receive sufficient shelter. One large telling bed consisted of *Ficus indica*, *F. elastica*, *Aralia Sieboldii variegata*, *Curculigo recurvata*, the Blue Gum tree (*Eucalyptus globulus*), *Melanthus major*, *Amicia Zygomeris*, *Acacia lophantha*, *Nerium splendens*, *Amaranthus Huttoni*, *Abutilon Boule de Neige*, *A. Thompsoni*, *Plumbago capensis*, *Myrtles*, *Maize*, both variegated and green-leaved; these were surrounded by a double row of *Chamaecephala diacantha*, and *C. Cassabonæ*, next a row of *Coleus Verschaffeltii*, edged with large plants of *Echeveria secunda glauca*, a very fine bed.

Four small beds at the outer edge of a group of larger ones were very nicely filled as follows:—centre, a large example of *Echeveria metallica*, very small plants of variegated and green American *Agave*, *Haworthia*, two or three small species, *Saxifraga longifolia*, and others; these were planted on a carpet of *Sedum glaucum*, edged with *Sempervivum tabuleforme*. A very effective large bed in a recess, backed up by trees, is composed as follows:—centre, the *Wigandia-leaved Tobacco* (*Nicotiana wigandioides*), surrounded by a double row of *Dell's Beet*, edged with *Sempervivum*.

Amongst bedding *Pelargoniums*, nothing equals *Vesuvius* as a dwarf scarlet, or *Lucius* where a taller grower is required; *Walham Seedling* is the best crimson, and *Cleopatra* stands unequalled as a pink. An *Ageratum*, raised by Mr. McIntyre from the old *A. americanum*, is the most floriferous and effective medium growing variety we have met with.

Ficus elastica, and *Abutilon Thompsoni*, plant for plant alternately, made a good bed, colour and form alike contrasting effectively. The yellow-leaved *Fuchsia*, *Golden Treasure*, makes a nice yellow edging. *Canna discolor* is still much the best of the bronze-leaved varieties, and *C. Annei* is unsurpassable as a large-leaved plant for outdoor summer decoration, taking into account its free, healthy growth.

We noticed an immense number of well-grown *Chrysanthemums* in pots, which, before flowering, are stood under canvass, where they cannot fail to make a good display late in the season, when the sight of a few flowers has a cheering influence. Z.

ABOUT POTATOS.

On the morning of July 25, the appearance of the firmament promised a fine day. Toilet and breakfast were therefore works of despatch, and an invigorating walk in the fresh morning air soon brought me to Theale Station, for Reading, by early train, where I found my friend of cheery English face who, with a hearty shake of the hand, bade me take a seat beside him in his trap, soon to arrive at the Messrs. Sutton's seed trial grounds; for, let it be known to all and sundry, we were on Potatos bent.

Now, if I, a Solanumist, do not dwell upon or make comment on the gorgeous array of new and charming annuals, &c., displaying themselves right and left on our drive through the grounds to the seed cleaning-houses, let not my readers indulge for a moment in the supposition that it was for lack of an appreciation for the beautiful. My mission at the above date was concerning the food of the people; we now stand in the midst of, certainly, one of the finest and choicest collection of Potatos in the world.

To the early sections of the esculent we will give

precedence, and notice an extensive oblong plot of Sutton's Improved Ashleaf, a result of many years careful selection, which we may term a superior type of the old Walnut-leaf Kidney, maintaining the dark green glazed foliage of the above famed, though disappearing good old esculent, with a decidedly and more to be preferred evenness of tuber. Lee's Hammersmith kidney follows, being a very good selection, and coming in rather earlier than the old Ashleaf Kidney, of which it is a desirable type. Mona's Pride takes its place now as a broad-leaved selection of Ashleaf; a fine variety, though seldom equal in flavour to its compeers above. Progressing, we especially notice a variety named Alma Kidney, a dwarf and very productive sort. Next comes Veitch's Ashleaf, showing its precocity over that called Rivers' Royal, and, as seen here, scarcely if any difference exists between it, and the old Ashleaf Kidney, a fine parallelogram, of which comes opportunely to confirm our opinion. Rivers' Royal Ashleaf, a lasting favourite, is here very true; a fine variety, for which I formerly stood sponsor. Then follows Myatt's Prolific Ashleaf, showing itself earlier than Rivers'; indeed, we always thought, the former to be a selection from the latter, but that is now a "far cry." [We believe they both came originally out of the same sack. Eds.]

Here, notwithstanding our settled resolve, the beautiful insists upon our notice, becomes jealous in face of the useful, by distracting our attention to some varieties of double and single Dianthus. These charms of Flora are not grown one quarter so extensively as they deserve to be? Alas! how extremes meet; for *dos-à-dos* are thirty-three "parcels" of Snowflake Potato, derived from so many sources, sadly afflicted with the "curl." Compensation in Sutton's King of Potatoes revives our spirits again. It is an excellent variety, in all the rudeness of health. I suppose this Potato has taken more prizes than any other kind in existence? In a measure this may be owing to its property of producing tubers both round and kidney-shaped; at all events, it is a productive, excellent, and long-keeping sort, which does not "chit out" till late, albeit it is a second early variety.

Gloucester kidney follows: is there any difference between it and Rivers' Royal Ashleaf? Prince of Wales too, a long yellow kidney, I see is also here, and so is Fenn's Bountiful Red kidney. The latter is a rich nutty-flavoured Potato; but let purchasers beware of planting it on any except the richest ground, and, *vice versa* so considered, is Sutton's Magnum Bonum, happily following. This is a new, and it certainly will be a popular and lasting variety, for field culture. It has, too, a gratifying history, which I wish I had leave to present to the readers of the *Gardeners' Chronicle*, and it only for that philanthropic act of loving mankind, and raising a worthy human being from penury to a bountiful state of happiness and plenty; as long as I can grow a Potato I shall encourage this Magnum Bonum monumentally in honour of the worthy firm whose name it bears. My friend and neighbour, Mr. Bellis, astonished us by the amazing produce he grew from 1 lb. of the tubers last year.

Hundredfold Fluke, too, along with the American Roses (early state) are beauties, which lies but skin deep, and on that account are to command as "show varieties."

Surprise, has a dwarf lopping woolly haulm, and as a round Potato is a promising variety. Next we note Beaconsfield kidney as being merely of the type of Lapstone, followed by "Waterloo kidney," a kind which retains itself long in my memory, as long indeed as I can remember anything about Potatoes, for as a child I saw it grown in my uncle's garden in Suffolk. He called it then the old Cambridge Kidney; I made it the male parent of Fenn's Onwards, a seedling crossed with the true old Fluke, which produced for me (after years of application in that way), a first satisfactory "flesh" to start upon—the predecessor of my English posterity of second early and late seedlings. Nevertheless, I have always regretted Onwards becoming public property, as it is not a large cropper, but it is quite at home in old fat suburban gardens, where most esculents are apt to grow merely to greenery. Next comes Hayes' Kidney, a dark foliated variety of Lapstone, the old Cobbler's Lapstone, Carter's Lapstone Fluke, and Thos. Almond's Yorkshire Hero, a graft hybrid between the Lapstone and Lancashire Flounder. I can speak advisedly so, because I hold copies of Mr. Almond's data. The old

Lapstone will not produce the crumpled appearance in foliage which is a peculiarity derived from the grafting process. Grafting will indeed spoil the evenness of any type of haulm, but very rarely indeed will it improve the Potato, and never forbid a Lapstone from remaining a Lapstone or otherwise, according to the graft. The process will dwarf or increase the stature of growth, instances of which are found in Yorkshire Hero, the tallest, and in Fenn's graft hybrid Perfection (Lapstone on Onwards), the dwarfest and earliest of the Lapstones. I fear the numerous selections of the family and the two hybrids above have got so mixed together, that a plot of Lapstones is scarcely to be found, but in a very confused state of greenery? But to my taste, nevertheless, the Lapstones are well worth dwelling upon, and always worthy of a place both for eating and showing. Next the old Red Ashleaf and Red Fluke for colour, and Gelf's Exhibition, the exact type of Prince of Wales Potato, which is all that need be said of the trio. Now the old Fluke, true and patchy; a good old sort, and to be regretted, for it is nearly gone. Next comes Jersey Blue, an excellent sort, followed by a lot of tallies pointing out nondescripts—seedlings sent to the Messrs. Suttons' for trial!

Pray do not envy the Messrs. Suttons under this compartment; we could "roar you" on their types of haulm, but none of them for our taste are sufficiently distinct from what we have in galore. Nevertheless, pray accept, for the sake of progress, our picture of a few. Greytrees Seedling, having a Victoria type of haulm, and a seedling something like King of Potatoes (this took 1st prize for "rounds" at the Messrs. Suttons' last show); Danish Queen, like Dawes' Matchless both in top and tuber; Countess of Tascor, a medium crumpled creeping haulm; and Worksworth Seedling, of a Willard's Seedling style. Now we come to a really good old sort, namely, Fox's Seedling; I remember it well, a Potato of excellent flavour; and so is Martin's Seedling, a sort I formerly grew at the same time. I do not observe the latter here, but it should be. Soden's Early Oxford—this is another good kind; the old Early Shaw, too, is here; this rare variety I also remember as growing in Suffolk side by side with the Cambridge Kidney. The disease had already singled it out. The Dalmahoy, an early Regent: I class this desirable Potato along with Daintrees' Seedling Round, because the one cannot be distinguished from the other except in the boiling, and here the Daintrees will become cooked some 10 minutes sooner than the other. Daintrees' Seedling never made its way as it deserved, and I strongly suspect it is often distributed in commerce as the Dalmahoy. Gryffe Castle Seedling: here we arrive at what I think to be the best of all the Regent class; Drummond's Early Regent, too, takes a position here, as also Rintoul's Early White Don, a very good type of an early Regent. Mr. Rintoul issued also a Striped Don, which I think the best of the two in point of true Regent flavour.

Then we meet with Rector of Woodstock, another standard variety, which requires little recommendation from me. It will recommend itself wherever grown, unless it be on very poor soil indeed. It is a cross between Fenn's Onwards and the Early Red Emperor, to improve the former as a cropper, and it did so, at the same time retaining the superior flesh of Onwards. The old Fortyfold is here true; an excellent sort, but, like many of our fine old varieties. I fear it is becoming sadly deficient in constitution; at any rate it is becoming very scarce and difficult to be got, and that is a sign of it. Some people are blessed with the digestion of ostriches, and like a Potato close of flesh, and here we notice the Stirling White, a Regent likely enough to suit them. Snowball, Walker's, Paterson's, and the good old York Regents, are here extensively in stock, along with the old Scotch Rock, in foliage one of Paterson's Victoria type; and by consequence of this popular variety having failed in Scotland last year, another Potato arose named Champion Rock, having a taller haulm with narrower foliage. As a London cooking favourite, we shall be sure to hear more of the Champion Rock. Paterson's Victoria, a universal favourite, which we mention as being here extensively in stock, of course, requires our strenuous praise, so well are its good properties known and appreciated. Sutton's Redskin Flourball does not require its praises sung, so suitable is it generally considered to be for general culture. Worthington G. Smith, also, has now taken its position in the trial grounds. Messrs. Sutton are

the possessors of the only stock of this, as I consider it to be an acquisition for early frame work and early border culture only. It is a cross between the old Ashleaf and Turner's Union Round. We trust to hear of this variety taking high rank for excellence of flavour. It is a good cropper, and will attain size. Model, and Porter's Excelsior, too, as show varieties, are popular, but both of them require a good digestion. Schoolmaster, also, is greatly spoken of, and is grand in growth. For colour, follow Paterson's Marchioness of Lorne, P. Scotch Blue, and the now very scarce old Red Regent.

Walking in another direction, we arrive at a plot of Potatoes, being a result from large tubers left at the Messrs. Suttons' after their autumn show—truly a motley lot, which we gaze as pleasantly upon, doubtless, as would the "wyld savage" of a contemporary upon a garden of Roses. A fine piece of Oxfordshire Kidney is adjacent. This is a Potato for which there is arising "great inquiry." Golden Dwarf, a round good cropper for the size of its haulm, may be termed an early forcing sort, and suitable for border work. A kind called Golden Zone, owing to a slight variegation of yellow around the margins of its leaves, induces me to observe that what we want for future introduction is distinctness of both haulm and tuber, as we have so many selections or types of sorts running so nearly alike that it has really become quite a puzzle to distinguish the one from the other—in fact, there is a great surplussage of distinctions with a very little difference.

My friend now orders his trap, and we drive around the trial grounds, where the rich and the rare would fain win upon us, but however arch their smiles we were not to be won over; Potatoes was our strength, and once more we arrive at extensive plantings of Magnum Bonum and other varieties already named, but worthy again of mention *en bloc*, as having been planted after the coarsest preparation, upon rough soil merely ploughed, and the sets dibbed in every other furrow, to be horse-hoed, moulded, and left to take their chance—a finer lot of growing Potatoes were never seen as a result, and we make a note of it. Thus ends our observations on the most noticeable and approved varieties of Potatoes of the day, and yet, let it be observed, all this extent of sorts consists merely of samples taken from the bulk furnished by individual growers as they arrive at the Messrs. Suttons'. These "parcels," or samples, are consecutively numbered for planting in the Berkshire, viz., the Reading trial grounds, to be taken future note of for purity.

The bulks of the "parcels" are then grown in different parts of the country, to be issued in commerce. But should the two test rows in the trial grounds prove mixed or untrue to name, a bad mark is written against the number, and the corresponding defective bulk is not allowed to be distributed. It is wonderful how pure the stocks arrive; we could not distinguish more than three test samples that were defective. Of course their representatives will never find a place in the Messrs. Suttons' stores, nor, consequently, in the grounds of their customers. *Robert Fenn, Cottage Farm, Sulhamstead.*

THE BRITISH ASSOCIATION.

WE cull from the local papers the following extracts relating to subjects within our department, and one relating to the Telephone, one of the most wonderful applications of electricity:—

THE TELEPHONE.

Mr. Preece described the progress made in the adaptation of electricity to the transmission of sound—from 1837, when Page, an American physicist, discovered that an electro-magnet could be made to emit sounds, to the production, in 1861, by a German named Riess, of the tone telegraph. Riess's telegraph simply transmitted tones, a lady's voice and a deep bass being both rendered alike. The real discoverer of the telephone, Professor Bell, of Boston, commenced to work in 1873. Mr. Bell had devoted nearly the whole of his life to the examination of the vocal organs. His attention had been particularly directed to the movements of membranes under the influence of the voice, and step by step he produced his articulating telephone, a specimen of which Mr. Preece produced and experimented with. The wire was connected with the Post-office, and some amusing conversations were carried on between Sir William Thomson, Professor Haughton, Professor Adams, and others, at the section end of the wire, and Mr. Preece's assistant at the other. At the request of Professor Adams and a lady who was asked to try the instrument, the assistant sang "Auld Lang Syne," "Rule Britannia," and another melody.

Only the person who had his or her ear to the bell of the telephone could hear the sounds transmitted ; but their evidence was that the thing was a complete success. Other experiments were made, including one with Eddison's tone telephone, which is intended to transmit musical sounds audible to a roomful of people. Professor Bell has made experiments in Glasgow, and has succeeded in speaking through what would correspond to 200 miles of Atlantic cable, and through a length of ordinary wire equivalent to 3000 miles.

Experiments have since been made with this instrument between Jersey and Dartmouth, and with complete success—"God Save the Queen" sung at Dartmouth being distinctly audible in Jersey.

"THE MATERIA MEDICA OF DEVON." BY EDWARD SMITH, F.C.S.

The pharmaceutical productions derived from the fauna of Devon are, the paper stated, of the usual character. The eggs, suet, milk, lard, cod-liver oil, ox-gall, honey, &c., differ little from those of other counties, but milk appeared to have a singular affinity for water, which almost amounted to a function. In the flora there was more material to work upon. *Aconitum Napellus* is found in patches. Of *Papaveraceæ* and *Linoaceæ* there were several varieties, as there were also of *Cruciferous* plants, *Rhamnaceæ*, *Rosaceæ*, &c. There are three Mints—*Meotha Piperita*, *M. viridis*, and *M. Pulegium*, representing the labiates. The *Pulegium* is found in swampy places, and was called in Devonshire dialect "organs," or "argaws." The origin of this word the author did not know. In a poem in the Devonshire dialect, published in 1867, these lines occurred—

"Jist put her tooties in hot water,
And g'er a few strang 'argaws' arter,
Or else some feather foul."

That is, "Put her feet in hot water, and give her a little strong pennyroyal tea after, or else some feverfew." Among other plants the various Willows flourished abundantly throughout the county.

PLYMOUTH ROSES.

Mr. T. R. Archer-Briggs, F.L.S., read a paper on the Roses of the neighbourhood of Plymouth. Mr. Archer-Briggs illustrated his essay by means of a map of the district of which he treated, and specimens of many of the plants referred to. He said that having been made aware quite recently that the British Association was desirous of receiving papers on local subjects, he was induced to prepare one on the Roses of the neighbourhood, as the literature on the subject was scanty, and not one of the authors of any portion of the floras of Devon or Cornwall had given special attention to this genus. Incited thereto by Mr. Baker's monographs on British Roses, appearing in 1864 and 1870, he had endeavoured since to identify the Roses flourishing within a radius of 12 miles of Plymouth with those species and varieties classified by him. The endeavour involved extensive research, both on the Continent and at home, and, among others, M. Déséglise, one of the first authorities on the genus, had rendered him valuable assistance.

THE COLORADO BEETLE.

Mr. McLachlan dealt categorically with the history of the insect, its habits, its migratory movements, and the reason the inhabitants of Europe have to dread its infiction upon them. In Europe attention was not much directed to this formidable farmer's enemy until four or five years ago, when the danger of importation forced people to weigh the disadvantages of a possible scourge and impelled entomologists to study. Laws were passed in consequence of the agitation which then took place, the effect of which was virtually to put in quarantine vessels from America which there was reason to apprehend might bring any of the beetles. In England fear of the insect culminated in the Destructive Insects' Bill, passed by Parliament a week or two since. But unless Potatoes be imported in the future in far greater quantities and with less care than heretofore, Mr. McLachlan believes the danger of their coming concealed among tubers to be very small. It is certain that the beetle swarms on the Atlantic seaboard of the United States, so that there is every chance that it has over and over again been conveyed on steamers and other vessels leaving for Europe. It, therefore, seems not improbable that a few should have arrived here promiscuously. The opinion expressed in the paper was that the pest is more likely to be introduced in a general manner than from any special association with Potatoes. Ooe meads, and a dangerous one, of its introduction was pointed out by Mr. McLachlan to lie in entomologists sending living specimens as study objects to their brethren in England. The insect in all its stages has been so sent frequently, and the chance of escape is not small. The great danger consists, however, in the possibility of the living insects being exported from America as things of commercial value, or by amateurs who know nothing of packing. That the panic of late given

rise to has increased our risks a hundredfold, Mr. McLachlan believes there can be no doubt, because in times of panic the evil passions of human nature are aroused, and some people might, in a spirit of mischief, turn the beetle loose. The alarmists had little or no ground for their reports. The insect might be expected of its own accord to find its way. Admitting that importation has taken place, it remains a question of moment whether the creature can propagate to such an extent as to be dangerous. Several prominent entomologists affirm that for it to flourish here is almost impossible, on account of the dampness of our atmosphere. These maintain that although it is used to intense cold, the climate it comes from is very dry, and not subject to those remarkable changes of temperature to which we are accustomed in England. Against this theory Mr. McLachlan advanced the fact that in a few years the insect has shown itself possessed of a constitution extremely elastic, and he expressed the opinion that upon this ground we are not so secure as might be wished. Another argument tending to foster ideas of security has been urged, viz., that although we have introduced into America a great many noxious insects, among which is our common white cabbage butterfly, none have been sent across to us and become acclimatised. As a reason for this, Mr. McLachlan pointed to the immense exportation of plants from the mother country to America, as compared with what she has been the recipient of from the Western Hemisphere. We have, nevertheless, received a considerable number of weeds, he remarked, from America which had become so widespread here that now they must be regarded as integral parts of our flora. One reason for congratulation when contemplating a visit from the Colorado beetle, he thought Englishmen have, which is, that we have more insectivorous birds in proportion to our insects than there are in North America. It is said the rook would devour the larvæ of the beetle should it come here; and it is certainly worthy of note that where the insect most flourishes there are no rooks.—Sir. Willoughby Jones intimated that he had been requested by Lady Hooker to inform the Department that she has received from Sir Joseph Hooker, at present travelling in America, a letter wherein he avers that the beetle in its own proper latitude lives naturally not on the Potato, but on a wild species of *Solanum*. Sir William expressed a doubt, from his knowledge of the habits of rooks, whether those birds would eat the larvæ of the Colorado beetle.—Mr. Napier, who produced some specimens of the insect, said a mixture of one part of white arsenic to ten parts of soot had been found by friends of his a good thing to destroy the beetle. He believed the country should be provided with county entomologists, such as are appointed in the United States, and pursuant thereto moved "That this section communicate with the committee of recommendations, and request them to ask Her Majesty's Government to consider the matter of county entomologists." This motion not being seconded, Mr. Napier resumed his seat after mentioning the starling, the thrush, and the blackbird as birds which would be probably useful in repelling the incursions of the beetle.—Professor Newton objected to the conclusion of Sir Willoughby Jones that rooks would not destroy the larvæ, and pointed out that starlings would be of no use at all as protectors, inasmuch as they never feed save where they can look at all that is going on round about them.

THE PITCHERS OF THE CEPHALOTUS.

Professor Dickson, M.D., drew attention to the general structural characteristics of the pitcher, and detailed its varied forms, external and internal. He described the cells and glands both in the bottom of the pitcher and on its upper surface, and stated that on the upper surface of the pitcher and the lid, and above the surface of the non-pitcher bearing lids, small oval glands are found, each consisting of a central oval formed by two cells, these being surrounded by four others. Exactly similar glands occur, also, upon the inner surface of the pitcher lid, but, from their universal occurrence elsewhere, Dr. Dickson is disposed to doubt their secreting properties. Dr. Dickson also drew attention to the very remarkable hairs found on the outside of the pitcher lid, upon the wing-like appendages on the outer surface of the pitcher, and—but here of a somewhat weaker description—on the petiole and margin around the non-pitcher bearing lids. These appear from the extremity to be within a quarter of the whole length of the base to be solid. The boundary of the cavity, however, consists of a wholly refractive wall, so distinct from the outer and terminal portions of the hair as to give the impression of one hair being enclosed within another.

In the discussion which followed, Mr. Lawson Tait for the most part corroborated the results of the examinations of Dr. Dickson, and added some observations of his own, going to show that the action of the gland in the *Cephalotus* was as distinctly digestive in character as in the *Nepeathes*.

STRUCTURE AND HABITATION OF PLANTS.

Mr. Alexander W. Wilson, M.A., read a paper on "Structural Characters in Relation to the Habitation of Plants." These characters treated mainly of succulent leaves which possess a few stomata on the surface for the exhalation of heat, suiting them for dry hot climates. He gave an instance from the works of Livingstone, showing that when the Boers first took possession of the Kalahari Desert it was covered with a coating of grass, but a succession of long droughts had proved too much for the grass, and it had been superseded by *Mesembryanthemums*, plants better equipped to withstand the aridity of the climate by means of their thick leaves, and the peculiarity of their seed vessels. He further illustrated this by means of the common Houseleek, which grows readily on the roofs of thatched cottages by means of the succulent quality of its leaves. He explained the water glands in plants, the perfume in plants, and the growth of Ferns in reference to climatic effect, and traced the aromatic leaf glands to the principle shewn by Tyndall's experiments that these perfumes prevented an excessive radiation of heat during the night. In the discussion which followed it was pointed out that there were plants, such as the Wallflower, the roots of which took to the soil as a sort of attachment only, whilst the hairs with which the plant was liberally covered absorbed the moisture in the air so rapidly and so freely that they were frequently used as indicating the moisture and dryness of the atmosphere. Various opinions are expressed upon the growth of Ferns, and the condition under which the best Ferns, both English and foreign, were produced, it being argued on one side that the best Ferns grew in moist places, especially over rivers, whilst it was stated that in the Mediterranean they grew luxuriantly upon rocks, absorbing such heat that it was uncomfortable for the hand to be retained on the rocks for any length of time.

THE FLORA AND FAUNA OF PRE-HISTORIC TIMES.

Professor Rolleston, M.D., F.R.S., remarked that Beech mast was a very preservable thing, and that Buckwheat was no other than Beech-wheat. Great men did not ordinarily make great mistakes, and the mistake made by Julius Cæsar that everything was to be found in England that was to be found in Gaul, with this one exception, was not a great mistake, because the Beech was not found in anything like the profusion in England at that time that pre-historic deposits showed that it was found in Denmark. It was interesting to know that the bottom of the word beech was to be found in *boc* or *bock* in every Saxon tongue, and, consequently, he must not omit to mention that we call the meat of the pig which was fed on the Beech we call bacon. The Beech, it was true, did not enter into the works of Nature's poet Chaucer, but he also omitted the Willow and the Birch. The omission was supplied by Spenser. He (Professor Rolleston), came to the conclusion that the Beech was present in England in pre-historic times, and did form a part, though not a large part, of the landscape. There could not be a doubt that the Wych Elm was indigenous, and was used for coffins, and that the Birch was used for tools. Ash was found also in English peat, although it was not found in Scotch. There was a good deal of difference between the description of animal life in England and Scotland, and so there was in vegetable life. The Spruce Fir was not found in England at all. There must have been some destruction of continuity which hindered that tree from ever establishing itself in England, which it never did excepting by the help of man, when it spread with ease. There was some doubt whether or not the Lime tree was indigenous, but he was inclined to the opinion that it was, for reasons he adduced, an important prehistoric tree. He would now pass on by a natural transition to the hive. He could not find out when the hive was introduced, and he had no recollection of it in any but comparatively recent writers. The speaker proceeded to talk of bees and honey, and spoke of the enormous difference the Sugar-cane had made in modern days. He would leave that highly interesting class of insects and proceed to speak of a class of mollusca, for which he had a great affection. What enormous changes had been witnessed in the mollusca of this country since pre-historic times. Some persons would have it that the large road snail was an importation, but he believed it to be a regular, real, old-established British snail. The water snail *Dreissena*, which was exceedingly like the mussel, had only been comparatively recently found in this country, and it was a mistake to suppose it had been found in prehistoric times, the probability being that it was found in a deposit containing a pipe of the time of Elizabeth, and a coin of the time of Victoria. The fact was, that a great many cargoes of wood came from Russia; this wood was floated down rivers, and with it these mussel-like snails, which came in profusion from Russia. Passing on to the consideration of birds, Professor Rolleston remarked that cranes were very familiar to the eyes of neolithic man, but now these striking and beautiful objects were so rare that one had to visit a zoological garden to see them. With regard to the rabbit, he believed it had only lately established itself in Eng-

land. In many tumuli the rabbit had done a wonderful amount of mischief. He had several times found at the mouth of burrows pieces of flint they had ruthlessly destroyed. If rabbits had such a hold on the country in former times, every one of these things would have been destroyed; and consequently, Chaucer, who died about 477 years ago, mentioned it as being in parks. He inclined to the belief that the Romans, who brought over the Chestnut, the sheep, the fallow-deer, the Roman Elm, also brought the rabbit. The rabbit never travelled 100 yards from its hole if it could help it, but—he was afraid he was trenching on the Malthusian question—an animal like the rabbit would overrun the whole country if it were not for the antipathy to its spreading entertained by the rival animals. What explained the comparative paucity of the rabbit in former times was the great abundance of the yellow and white martin. England was one of the most profusely wooded countries, acre for acre, to be found in the world. The martin now was a very rare animal. The rabbit was very common now in some of the Ægean Isles. The ancient Greeks referred to the hare; in those days the martin was employed as a cat. Our cat was not employed until a short time before the Christian Era as a mouse killer. He had heard many people speak of the common Norway rat as belonging to prehistoric times. There was a gentleman in Plymouth who did send him a quantity of black rats, and he desired to give his acknowledgments, not knowing his name. There had been some speculations as to whether the presence of rats might not be connected with prehistoric superstitions. In one prehistoric mass of burnt deposit he himself found the upper and lower jaws of the common water rat. He wondered how they got there, but after making a careful examination of the whole mass he found a polecat's tooth. That animal had made this place its home, and fed its young on the rats. But for that discovery he might have been betrayed into making a rash speculation.

Natural History.

THE CUCKOO.—From my bedroom window on the evening of August 4. I was surprised to see a fine young cuckoo come and alight upon the rails of my little garden, about 20 feet from where I was sitting. Believing that all the cuckoos had left England for some time past, I was casting in my mind, "Could it be a cuckoo?" when all doubt was at once removed by a little Haisne (hedge-sparrow) coming to feed it, and the sight was not a little strange of so small a bird feeding one I don't know how many times its own size. In so doing the foster mother had to stretch herself to the utmost of leg and frame to be anything like on a level with this giant offspring. Never having seen a cuckoo so close at hand before, I was careful to notice it well, and it gave me ample opportunity, having kept its position more than half an hour. The whole frame of the bird was covered with feathers of a rich glossy brown, crossed from side to side with bars of a much deeper colour. The head had a mixture of brown and white feathers, the brown greatly predominating. The bill I thought small for so large a bird, and the movement of the jaw opening and shutting, suggested to me that the bird was uttering some sound; and so it was, as I understood from one whose hearing was better than my own. I had always been taught and always believed that the cuckoo—the real mother—took no further care of its offspring than to deposit the egg in the nest of some small bird where there was hardly room for expansion to the full size; but I have been led to think this idea incorrect. In June last I saw an old cuckoo alight on a stump in a hedge not 25 yards from where I was sitting, and where I now am. It seemed to be noticing something low down in the hedge, and all at once plumped down to the bottom, for there was a shard there (a gap), and my friend remained there just about two seconds; then away it flew—some one was coming. In about a

fortnight afterwards I saw the young cuckoo flying from stump to stump. There was not time in those two seconds I have described for the old one to have dropped the egg; nor, if there had been, for the young bird to be hatched and fledged before I saw it flying from stump to stump (a fortnight). Can any one give a word to enlighten? *Thomas Reed, Gloucestershire.*

Garden Operations.

PLANT HOUSES.

PLANT STOVE.—It is now time to give such treatment to stove plants generally that require a rest for some time during the latter months of the year, as will induce slower growth with maturation and solidifying of the wood. This should be brought about by keeping the atmosphere somewhat drier, yet not such an absence of moisture as to cause that dry, arid condition of the air to which plants are sometimes subjected, but which is always more or less injurious in its consequence. More air should also be given during the middle of the day; but here again the excessive quantity frequently admitted must be avoided, as it has a similar effect in drying up the atmosphere of the house too much, and through which, where practised, it generally follows that red-spider, thrips, and other insect pests that revel in a dry atmosphere on plants, reduced to a languid state by the treatment above referred to, are even more plentiful through the autumn than in the earlier parts of the season. Less shading should also be used, so as to inure such plants, particularly flowering subjects, to the direct influence of the sun. Considerably less water ought to be given to the roots, the restriction here advised being more or less according to the nature of the different plants under treatment. Evergreen subjects should never by any means be allowed to flag for want of moisture at the root, where this occurs injury more or less is the result; if carried so far as to prostrate the energies of the plants seriously, it induces a complete stagnation of the roots and results in a stunted condition of the top growth. Deciduous things of a free-rooting character will bear to have water withheld until the leaves flag considerably, then apply a moderate quantity, such as will freshen them up, yet not so much as will moisten the soil to the extent necessary for the promotion of free growth such as required early in the season; giving no more until the plants again flag, when repeat the application as before. This gradually stops any further considerable extension of shoot and leaf growth. The temperature during the day whilst this ripening process is going on may be somewhat reduced, keeping it comparatively lower during the night, but not so as to arrest growth by chilling it. The treatment that stove plants are often subjected to with a view to stop growth and ripen them up at this season of the year is not only as ill calculated to effect the desired object as it will can be, but it inflicts serious injury. It is no uncommon occurrence to see plants of this description removed to houses where the temperature is much lower, or in other cases for the heat in the stove to be so far reduced as to stagnate growth completely in place of effecting the ripening process, in which case instead of the leaves and wood becoming firm and solidified, with the buds plump and ripe, the whole energies of the plants are at once reduced to a state of forced inaction, from which, if they survive the winter, they come out so enfeebled that when cut back and again started, the growth they make is of the weakest possible description. Light, warmth, a drier state of the roots, with a reduction of atmospheric moisture, are collective essential conditions in preparing plants for rest. Such individual plants of *Bougainvillea*, *Allamanda*, *Clerodendron fragrans*, *Rondeletia*, *Dipladenia*, *Gardenia*, *Hibiscus rosa sinensis*, *Ixora*, *Scutellaria Mocinoiana*, with *Dichrosandra mosaica*, *Aphelandra cristata*, and *Luculia gratissima*, which it is desired to keep on flowering as late in the season as possible, should either be moved to a separate compartment, or if such is not available, put at the warmest end of the stove, where they will receive less air, with more moisture to and about them than the plants that are being ripened off. It will be necessary to yet use the syringe to such subjects as the above, to keep down the yellow thrips and red spider. *Caladiums* that were started early into growth, and that now show signs of going to rest, should be gradually dried off, but still kept where they will have sufficient warmth. *Gloxinias* and *Achimenes* that have done flowering ought not to be thrust away in out-of-the-way corners whilst their leaves have any vitality in them, or left in cold houses; they should occupy a place in the full sunlight, where they will receive enough heat to effect the maturity of both tops and bulbs. For this end

they must not be suffered to get too dry at the roots, as if the tops are killed down, instead of being gradually ripened off, the tubers suffer proportionately. Plants of the above that have been grown for late flowering should have sufficient heat and moisture to prolong their bloom as late as can be. *Tydaens*, for a like purpose, if well attended to, will keep on flowering far into the autumn. The different varieties of highly coloured *Dracænas*, now so much used for the decoration of conservatories during the summer months, must not be left in such places too long, should the nights come cold and chilly. A very common practice with large specimens of these when so employed, and they have got at all bare of leaves near the base, is to cut them up for propagation when moved from their summer quarters; when this is contemplated, they should not be allowed to stay in a cool house until half the vitality is chilled out of them, or they will strike indifferently. If the roots of the plants are in a healthy condition when headed down, every bit of the old hard stem will strike cut into pieces about an inch long, inserted in sand in pots or pans, sufficiently drained and placed in a brisk heat; having no leaves to evaporate moisture, they do not require covering with a bell or propagating glass, but will root and form shoots fully exposed to the atmosphere of the house; the tops of the plants with leaves attached will need confining under a propagating glass. Every encouragement should now be given to *Bouvardias* for winter flowering; to induce a bushy growth, stop the shoots of all that are wanted to bloom later on, leaving entire those for flowering early; if required to come in soon they should be removed to the stove, or other structure, where they will receive a brisk heat of 70° or 75° during the night, with a corresponding rise for the day, accompanied by plenty of light, and sufficient moisture to keep them on flowering freely. *T. Baines.*

ORCHIDS.—In treating of imported *Cattleyas* and *Lælias* (for one class runs so nearly into the other, as in some cases to make it hard to determine them) the remarks made in reference to them will also in like manner apply to such things as *Schomburgkias*, many of the *Epidendrums*, *Arpophyllums*, *Brassavolas*, &c.; those that generally have stout, firm, and long bulbs, terminating with from one to three leaves on the top of the stems. In some instances, however, the bulbs, which are small, and carry only a single leaf, are produced so close to those of previous years' growths that the plants assume a very neat and compact evergreen appearance. When any of these of the latter class are obtained immediately after importation, the leaves are almost invariably absent, the smaller bulb sections appearing in this respect to be less able to bear a lengthened period of close packing, and an absence of moisture, than many of those of the long bulb species. In removing them from the stems and trunks of trees on which they have in most cases been growing at home, the damage and injury done to the roots is such that the plants in many instances are considerably weakened before they are packed for the sea voyage, and then with the absence of light and moisture, or other sudden changes to which they may be subjected, a great number arrive in what is described as "poor condition"—a phrase conveying a deal of meaning, whilst many others have quite succumbed to the treatment they have received. All the dwarf-growing species are the better for being fastened on blocks, on account of the small quantity of roots they will have, with just a small piece of moss laid under the plant. Do not cut the plants with the idea of increasing the number of them, as it often happens that in so doing many of the pieces die off altogether, whilst those that do live have less of vital power, so that instead of bringing a gain, such an operation in many cases results in a positive loss. When they have started freely on the blocks, and some of the back eyes are showing signs of growing and rooting, the knife may then be used, partially severing the rhizome at the first, then after a week or two cutting right through. It is, however, a bad practice to use the knife at all, and should only be resorted to where the increase of stock is a matter of first importance, and the exigencies of trade demand it. Hang the blocks, with the plants fastened to them, in a convenient place in the *Cattleya*-house. Syringe them regularly twice a day, keeping them at first a little closer than is to be recommended for established plants, and at the same time giving them a little more shade. It is rather trying at times to carry out precise instructions, more especially when only one or two houses are devoted to the culture of these plants; and since so much has to be left to the control and management of those who have charge of them, and at the same time the conveniences and opportunities are of a very limited order, such suggestions must be carried out so far as the means at command will permit. *Lælia albidia*, *autumnalis*, and *furfuracea*, *Cattleya citrina*, &c., should be hung in the *Odontoglossum*-house, these requiring less heat than the majority of the others. As soon as the breaks and roots have pushed freely away, more air must be given, and the shading not allowed to remain on so long. Under this treatment the plants will often in one season assume such a healthy and vigorous appearance that they will appear

to be more satisfactory than many that have been in the collection for several years. The white scale, to which they are all more or less subject, must be got rid of by careful and regular sponging, using a little soft soap in the water, and a few drops of turpentine mixed in with it. The species having bulbs a foot or more in length cannot be managed so well on blocks or in baskets, on account of the difficulty of moving them about, and also of fixing them on the sides of the houses, or suspending them from the roof. These should be fixed in pots, crocked nearly up to the rim, and only a small quantity of peat and moss used; when, however, the roots have started away, a little more must be added. These at first will be benefited with an occasional syringing. As soon, however, as the breaks have pushed up, and the leaves so bursted that the water would lodge in them, it must be discontinued, otherwise many of the new shoots will be liable to rot off, often causing the loss of the entire plant. If the Cattleyas, &c., are received late in the autumn or during the winter months, it is advisable to give those that are to remain in the Cattleya-house a start for a few weeks in the East India-house, whilst those which will belong properly speaking to the Odontoglossum-house should be hung for awhile in the house devoted to the Cattleyas, the object, of course, being to give them a little extra encouragement when first pushing into growth. *W. Swan, Fallowfield.*

FLOWER GARDEN, ETC.

This is now the busy season for propagating a stock of all the bedding plants for next year's display in the flower garden, and I believe it is desirable to take notes from time to time of those kinds that are best suited for the place and the arrangements required, and any sorts that do not come up to the standard after a fair trial may be discarded, and improved kinds encouraged. There are so many fine things now that only the most effective should be used; but in some places with limited means and large requirements, time is necessary before a sufficient stock of improved varieties of the usual bedding plants can be got up. We commence with the variegated and Ivy-leaved Pelargonium, as they take longer time to root, and finish with the Zonals, all of which are propagated in the full sun without glass. More delicate-growing things root better in a higher temperature, and require the protection of glass frames or pits; such plants as Alternantheras, Coleus, Iresines, Heliotropes, &c., succeed best with a little bottom-heat. In taking off cuttings, some care is required, so that the beauty of the beds is not materially interfered with. Attend to climbers and all strong-growing plants in exposed places, as they are apt to get broken over by the wind if not looked after in time. Weeds are always very troublesome at this season of the year; therefore, keep the hoe going at every available opportunity. Garden walks, too, generally become full of weeds after showery weather. It is hopeless work to hand-pick, and breaking up the walk is not desirable after this time. A dressing of salt is by far the easiest mode of keeping them under; and, considering the labour that it saves, the cost is but trifling. Grass lawns still require frequent mowing and sweeping to keep them in good order. *Thos. Blair, Shrubland Park, August 21.*

FRUIT HOUSES.

MELONS.—The weather of the past fortnight has been unfavourable to Melons in all stages, particularly where the fruit is approaching maturity. Look well to the top and bottom heat until we have a change to brighter days and a drier atmosphere, otherwise deficiency of flavour will follow, and canker will show itself at the base of the stems. The best remedy in each case is a dry, warm atmosphere, with free ventilation, a liberal use of quicklime about the parts affected, and careful watering, which should be performed early in the day. Plants in pits and frames heated with fermenting materials only will well repay a little extra attention to the linings and covering up at night. Keep the young growths well thinned out, to allow the air to circulate freely amongst the leaves; ventilate early, and counteract the effects of dull weather by shutting up with as little moisture as may be consistent with the health of the plants. Push on late plants which have not set their fruit; if in pots, with a brisk bottom-heat, the syringe may be used freely until the blossoms show signs of opening, when treatment recommended for early Melons may be followed. *W. Coleman, Eastner.*

VINES.—Look over ripe Grapes for decaying berries, and stop all laterals sufficiently close to admit of a free circulation of air between the foliage and the glass. If the mild, showery, sunless weather continues, a little warmth from the hot water pipes, with plenty of air during the day, will be of service. Shut it off before night, and maintain a minimum temperature of 56° to 60°. Winter Grapes—this year later than usual—will also require fire heat to hasten the maturation of the fruit and wood by the middle or end of September, and so improve the keeping qualities of

the fruit when removed to the Grape-room. If lifting, or partial lifting and relaying the roots of Vines from which the fruit has been cut is contemplated, no time should be lost in getting the work over, as Vines lifted before the leaves fall form new root-lets at once; and if they have the advantage of an undisturbed inside border, be it ever so narrow, a crop of fruit next season may be relied on. We are now cutting a full crop of Hambros, 2 lb. to 4 lb. per bunch, from Vines so treated in October last. Readers of the *Gardeners' Chronicle* being thoroughly conversant with the mode of procedure, repetition is here unnecessary. Secure good drainage and use turfy loam, clay, or garden refuse, burnt with wood, in the proportion of six to one, with a sprinkling of crushed bones or old lime rubbish. If manure is used it should be laid on the surface as a mulching, to be washed in by autumn rains. Gradually shorten back the laterals where Muscats are ripening, but keep plenty of foliage all over the house to protect the delicate berries from being injured by the sun, as Grapes, if allowed time, always colour and finish best under a good canopy of foliage. Lay in a good supply of turf for future use. Take it off thin and stack in narrow ridges with a covering of thatch or boards for throwing off the wet. *W. Coleman.*

FIGS.—Cease to syringe the trees or otherwise use it about the house whilst the fruit is ripening, and to improve its character it should be exposed to the influence of sunshine and air as much as possible; and whenever circumstances demand it, apply sufficient fire-heat to keep the air in the house warm and dry, and in constant circulation by means of giving a little air at the apex of the house. This kind of treatment will greatly tend to help forward maturation in the shoots, and make success more reliable the subsequent year; also let the terminal shoots over the whole surface of the tree be allowed to rise in near proximity to the glass, so that they may become well hardened. This matter is very important in the case of trees which are to be subjected to early forcing operations. When trees are forced in pots, and these are already placed outdoors, see that no lack of attention is required; trees should have a plentiful supply of weak manure-water on every occasion when watering is necessary. A good second crop of Figs in houses which have been assisted by artificial means is at all times a certainty at this season, and now that such a scarcity of other seasonable kinds of fruit exist it will be invaluable. Continue the treatment as before advised to those trees where the fruit is swelling. Keep the red-spider in check, where it abounds, by frequent syringings, and supply copious waterings at the roots of trees under such conditions. *G. T. Miles, Wycombe Abbey.*

HARDY FRUIT GARDEN.

Such seasons as the present and others of a similar character that have preceded it, show how little dependence there is to be placed in obtaining crops of the choicer kinds of wall-fruit unless better means of protection than we now have can be devised to screen them from the inclemency of such weather as prevailed during April and May. From all quarters the same reports come of the almost utter failure of the crops, and in many instances giving deplorable accounts of the condition of the trees, thus showing how inefficient are the appliances in use in most gardens. The only crop of Peaches and Nectarines I have seen on open walls this year is at Sudbourne Hall, the seat of Sir Richard Wallace, where there is a wide glass coping from which I was informed nets had been suspended, and the two combined appear all that is requisite, for the situation is a bleak and exposed one; but possibly the frosts were less severe there owing to the near proximity of the place to the German Ocean. If those who have their walls protected in a similar manner would state what the effect has been during the past season, much good might be derived from it, as the trial has been a severe one, and such, it is to be hoped, as will not occur again for many years. Serious as the total loss of fruit is, the injured state of the trees is much more so, as it takes a long time to get them round again, or to replace such as are already established. That much replanting will have to be done this autumn is only too apparent, and no time should be lost in laying in a sufficient stock of soil for the purpose, so as to be fully prepared when the season arrives for getting them in. There is nothing better than good turfy loam, used without any addition whatever, as then it always remains in a clean healthy condition for the roots to feed on, which would not be the case were any vegetable matter, such as leaf-soil or anything of that kind, incorporated with it. By getting it carted and chopped up thus early, the grassy and more fibry parts will have time to decompose, and, beyond this, it cannot well be too fresh, especially when portions of the old border have to be mixed in with it. The genial growing weather we have lately had has caused a rapid swelling of the young wood, much more so than is usual at this season, which will neces-

sitate a close watch being kept to see that the ligatures of fresh-budded trees do not become too tight and cut into the bark, or become buried in the same, as, when that is the case, their removal becomes a difficult matter without doing irreparable injury. Grafts, too, from the fast growth they are making, and consequent large amount of leaf surface exposed to the winds, which usually prevail with great force soon after this season, will run much risk of being blown out unless securely tied to stout sticks made fast to the branches on which the scions have been inserted, or stuck in the ground in the case of those worked low, as is usually done on maiden stocks of such things as Apples and Pears. All fruit-bearing trees of these should now have the young wood stopped close back, except the leading shoots, and such as may be required for furnishing vacant spaces, and these should at once be trained to their proper positions, as they are more pliable at this season than at any other time. The present year has been anything but favourable for the early maturing of Grapes on open walls, and yet with attention and a fine autumn, good fruit may yet be obtained, which, owing to the great scarcity of all other kinds, will be found more than usually acceptable. If the same care in thinning the bunches and training and stopping the Vines were bestowed on these as is generally afforded to those under glass, they would not only ripen much earlier, but the fruit would be of far better quality than it is possible for it to become when crowded together in the way it usually is when left to itself, as may readily be seen at any time when a bunch happens to set imperfectly. Mildew generally makes its appearance about this time, but is easily destroyed by applying dry flowers of sulphur early in the morning, while the leaves are damp from dew, or it may be syringed on, by mixing it in water and keeping it well stirred during the operation, to prevent it settling at the bottom of the vessel. It is better, however, when used in this way, to get it in the liquid form, in which state it may be got from any chemist, under the name of pentasulphide of calcium, a wineglassful of which is sufficient for four gallons of water. *J. Sheppard.*

NO FRUIT.

SCENE—Somewhere in Kent. Present, POMONA, taking a somewhat fruitless survey of a Plum orchard. To her enter PUER, reading the GARDENERS' CHRONICLE.

Puer. I say, you know such a sell is too bad!
Pomona. Can't help it, my dear lad.
Puer. What! you a goddess, and can't "square" the seasons?
Pomona. There may be other reasons.
Puer. Walker! A nice look-out! No Apricots!
Pomona. Last season you had lots.
Puer. Can't live on last year's fruit. Then, scarce a Cherry!
Pomona. Spring winds are nipping, very.
Puer. Oh, blow the winds! A paucity of Peaches!
Pomona. The prospect patience teaches.
Puer. Gammon! Then Nectarines are non-existent!
Pomona. Boreas was so persistent.
Puer. Old Boreas is a bore, and you're—a muff!
Pomona. Currents were quantum suff.
Puer. I say, no "shop." Latin in the Vacation!
Pomona. Excuse me a quotation!
Puer. It all comes beastly hard upon us fellows.
Pomona. A fine crop of Morellos—
Puer. Insult to injury. Worse than Crabs or Sloes.
Pomona. Goosegog's—you had heaps of those.
Puer. But hang it, we're to have no Apples. Fancy!
Pomona. Apples are always "chancey."
Puer. Look here, POMONA, no more larks next year.
Pomona. I'll do my best, no fear.
Puer. You and Vertumnus ought to square the orchard.
Pomona. If Phoebus will not scorch hard—
Puer. Even with Plums and Pears we'd be content.
Pomona. Well, you see Parliament—
Puer. Oh, one expects short-comings from the Tories.
Pomona. O tempora! O mores!
Puer. An autumn without fruit's a rummy season.
Pomona. Ills haunt a good Plum season.
Puer. The dence they do! What do you mean by "ills?"
Pomona. Stomachic pains and pills!
Puer. Just you send Plums next year; I'll risk the rest—
Pomona. Well, well, I'll do my best.
[Exit PUER, munching an unripe windfall.—Punch.]

THE SERVICE TREE.—A tree, says a homely French proverb, earns its living, and so the Walnut, the Apple, or Service-berry is allowed to overshadow the Wheat and the Barley undisturbed. The Walnut gives a most valuable crop, besides supplying the grower with oil, whilst the Apple is sold for cyder; and of the fruit of the Service-berry is made an excellent drink, something like cyder, for his own use. It is called here (in Anjou) the *sorbier*, or *cornier*, and its wood makes excellent walking-sticks. The rich foliage of these trees, drooping low over the waving corn, has a beautiful effect, and I have seen some Wheat-fields planted with them as thickly as an orchard. "A Year in Western France," by *M. Betham-Edwards.*

THE
Gardeners' Chronicle.

SATURDAY, AUGUST 25, 1877.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY,	Aug. 28	{ Flower and Fruit Show at the Agricultural Hall.
WEDNESDAY,	Aug. 29	{ Isle of Thanet Floral and Horticultural Society's Show.
THURSDAY,	Aug. 30	{ Royal Horticultural Society of Ireland: Autumn Show.
FRIDAY,	Aug. 31	{ Bishop Auckland Flower Show. Sandy and District Horticultural Society's Show.

IF difficulty and failure furnish at once stimuli and opportunities to those who know how to use them, then have the CULTIVATORS OF FRUIT now a fine opportunity of distinguishing themselves. Never, perhaps, has the failure of fruits in the open air been more general, or so complete. A crop of any kind of superior fruit is about as rare as a white swallow, and, in our ignorance of the causes that have produced or preserved such crops, we call them accidental escapes from the cruelly destructive range of the spring frosts. No doubt, however, a good deal might be learned by considering all the facts of those fortunate escapes. Truth is easier learned in units than in masses; it is more manageable, and also more clear, when looked at in single factors. Two facts seem to account for the general failure of the fruit crop of 1877—a mild winter and a severe spring. The first prepared the trees for failure; the second completed the work that may be said to have been in progress all the winter. For whatever theories may be adopted concerning the circulation of the sap, no one will deny that its abnormal activity out of season is a source at once of weakness and of danger to all plants, specially so to deciduous fruit trees and their produce. Unnatural heat is thus as real a source of danger as unseasonable cold. Unfortunately, both are largely beyond the control of cultivators, though not wholly so. Unseasonable growths may be checked by cultural expedients, such as a skilful choice of soils to suit localities, thorough drainage, root-pruning, frequent transplanting, &c.; and spring severities may be somewhat softened by permanent shelters or temporary protection. The science of root-culture may almost be said to be yet in its infancy. When it is better understood, cultivators will be the better able to control or modify climatal force and influence. Top culture can but affect chiefly the forms of growth, not its times and issues. The difference is immense; for, if by any means, and to any considerable extent, cultivators can control seasons of growth and of flowering, they could almost command crops of fruit. Already cultivators can produce fruit or wood buds at pleasure by advancing a long step and opening or keeping them closed at will; their power over crops would be almost absolute. Some measures of such power may yet be attained by cultivators through means of root culture.

More and better use might also be made of shelter as a means of saving our fruit crops from destruction. Shelter has a many-sided influence over vegetation. As popularly understood, it means keeping out a measure of cold. But shelter and shade are often inseparably linked together, and shade mostly shuts out a considerable amount of heat. It is through the skilful use of shelter or protective expedients in this double sense that safety for fruit crops may be found. For comparatively few crops perish through extreme cold. It is the frost and the sun between them, heat and cold rapidly alternating, and the extreme difference between the two that wreck the fruit crops in the open air. Modify the energy of the one by shelter and that of the other by shade—and just to the

extent that we are able to do either or both without violating the laws of vegetable vitality, we provide the most favourable conditions for an annual crop of fruit; and, besides, the two conditions of failure, a mild, growing winter and a severe spring with late frosts, do not always go or run in couples: going or coming alone they are the more easily met and mastered. "Try again" always has, and ever will be, the cultivator's brave words to failure. Success may crown fresh efforts put forth with more skill and over larger areas; clearer notions of the causes of failure, and of the exceptional successes, that are always formed every year, may also yet enable us to avoid the former and command the latter.

Notwithstanding recent failures—for this is the second bad year in succession—the times are propitious for a great extension and improvement in fruit cultivation. Public taste may be said to have got into a fruit groove; consumption is daily increasing and prices rising. Home supplies are totally inadequate to meet the demand. About six millions are paid annually for foreign fruits; almost two millions of which are expended on Apples, Pears, and other hardy fruits, a large proportion of which might be grown at home. The nation is not only the poorer for the loss of this capital, but the loss of wage to the labouring classes is probably at least threefold the amount paid for the foreign fruit. This estimate is probably far under the truth: it is found that for every acre withdrawn from agricultural production and devoted to horticulture, the money expended in wages is multiplied by ten or more. Assuming, for mere lucidity of statement, that the cost of labour per acre on farms is ten pounds per acre, that in gardens is at least twenty pounds—it may, indeed, often rise to three times that amount. On this ground alone, the extension of fruit culture becomes a matter of great national importance. It multiplies manifold the amount of capital. Labour is but capital in an active form, invested in the land. The value of the produce is also so much enhanced, that the capital invested in fruit-growing pays better than other kind of earth culture.

Neither is there any lack of land to be devoted to fruit growing: thousands of square acres of poor meadow land, that hardly pay for mowing, and on which the poor beasts doomed to roam over them lose rather than gain flesh; poor plantations, so neglected as hardly to grow a sapling, large enough to cover "fur," or hide a feather; commons, brown with barrenness, or gay with golden furze or pink heather by the mile; railway embankments, long and wide, sunny or shady, affording every choice and selection of soil. Many of these only await the summons of energy, capital, and skill, to be crowned with beauty and clothed with plenty; and each one, with cottage, house, or garden, without waiting for these heroic measures of fruit culture which convert miles on miles of our wastes into fruit gardens, and profitable investments, would begin at home and fill up their own little waste places. An immense impetus would be given to fruit culture, and our home supplies would be doubled.

Strict clauses are inserted in the Agricultural Holdings Acts to compel tenants to make good dilapidations in buildings, &c. It would be well to have equally binding on the occupiers or owners of cottage property to make good dilapidation, in house and garden. The nation suffers enormous loss of health and wealth through sheer dilapidation. A few years since we had occasion to visit Devonshire to see the orchards, but we could hardly see through the ragged fences, moss-grown, dying and dead trees. Those that the wind had uprooted—an enormous crop—riven and rent years ago, were left where they had been wrecked to live and die, rot or grow, as they might. Cottages, cot-

tagers, and gardens, seemed all alike dilapidated, and it seemed as if everything were beautiful but man and his works. A similar state of dilapidation among fruit trees prevails in not a few gardens. Old, dead, and dying trees are allowed to encumber the ground where young, thrifty, and more fruitful trees might grow. Inferior sorts also usurp the place that might be filled with far superior varieties. The root-power and energy already existing might easily be diverted to better uses by budding and grafting existing trees with the finer modern sorts. Having utilised to the utmost existing orchards and gardens, it will be necessary to look out for suitable places for the planting of more trees. These abound in all directions. There is hardly a cottage or out-building where room could not be found for one or more fruit trees—a farmhouse and premises where a dozen could not be planted. Walls, fences, low roofs, waste nooks and corners, might all be utilised and filled with fruit trees; and when these are all filled there still remains on most farms hills of useless slop and thousands of pollards of little beauty, and no use even for the fire, that could be cleared off and the spaces planted with Apple, Pear, Cherry, and Plum trees. Fruit trees might also be planted in hedgerows, injuring the fences less, and lighting up the landscape more than any other kind of tree. The fruit gathered from such trees would, therefore, be all profit. Again, what so beautiful, what more profitable, than fences of fruit trees or bushes between the fields of arable land. A fence of strained wire, covered with horizontal or fan-shaped trees, or with vertical, oblique, or diamond cordons, would form a fence at once strong, beautiful, and profitable. This last is a new element in fences, and it is worthy of the serious consideration of farmers in the present hard times. In good fruit seasons it might often happen that the fences would pay the rent of the field. Fruit fences would take far less space than the present fences, which are at once among the most costly and inefficient features of agriculture, ancient or modern. But there are many directions in which fruit culture might be profitably extended; opportunities, in fact, abound. What are most needed are the will to do it, and the knowledge of how to grow fruit with pleasure and profit.

One argument, often urged against the extension of fruit culture in the manner indicated, is the loss that would arise from predatory bipeds, feathered or featherless. Granted a certain amount of loss must be written off. But the Cherry orchards and Nut plantations of Kent are not considered unprofitable, although, we fear, the morality of Kentish starlings and Kentish schoolboys is not higher than that of their fellows in other counties; and while a certain amount of loss is inevitable, to allow such loss to deter the judicious cultivator is to credit him with less common sense and self-interest than we believe him to possess.

THE illustration on the opposite page (fig. 50) requires but a few words from us, so well does it tell its own tale. The plant is a magnificent example of the gorgeous *DENDROBIUM WARDIANUM*, and did belong, if it does not now, to J. G. HEPBURN, Esq., Sidcup Place, Kent, with whom it flowered last spring.

— Resuming our CARLISLE notes, in connection with the approaching INTERNATIONAL FLOWER SHOW, we mention next the Stanwix Nurseries, of Messrs. CLARK, BROS., & Co., established by them some eight or nine years ago, and successfully conducted with spirit and ability. A straight avenue, bordered on each side with a well arranged selection of trees and shrubs, leads to a handsome block of hot-house buildings, in which a large collection of specimen and decorative plants is grown for sale. The grounds are well stocked with ornamental and forest trees, and

the firm have recently found it necessary to acquire more ground, in which to grow trees to meet the demands of their trade. Near here are Beulah Gardens, the premises of Messrs. THOMAS ARMSTRONG & SONS, the raisers of the Garibaldi (Vicomtesse Héricart de Thury) Strawberry, who do a large florist and market garden business at home, and also send largely to

is being abandoned as an unremunerative speculation. Close by are the famous Strawberry gardens belonging to another branch of the same family—Messrs. THOMAS HAMILTON & SONS. This is a favourite resort of the lads and lasses of "Merrie Carlisle" in the fruit season, and nice tasteful arbours, covered with Honeysuckles, Roses, Clematises, and Ivies, are

a visit to those interested in such matters, as it was only finished during the past spring. Portland Square will also attract the visitor's eye. Should the stranger, tired for the nonce of flower shows and the crowd, inquire in Carlisle, "Where is the best place to go to for an outing?" nine times out of ten the answer would be, "To Wetheral and Corby Castle," 4 miles

FIG. 50.—DENDROBIUM WARDIANUM, AS GROWN IN THE GARDENS OF J. G. HEPBURN, ESQ.

the Newcastle and other markets. At Botcherby, on the Warwick Road, is the establishment of Messrs. JOSEPH HAMILTON & SON. Here the cultivation of the newer varieties of Cucumbers for seed is carried on on a large scale; also the forcing of fruits and flowers for market. The senior partner was the author of the Hamiltonian system of Pine-growing, which caused so much discussion years ago, and examples of it may be seen on the premises, though here, as elsewhere, Pine-growing for market

provided for their accommodation. Grapes for market are also grown, and a choice selection of ornamental trees and shrubs. Some discussion has recently taken place about the proper formation of town squares, and the due proportion and disposition of lawn, trees, and walks. An example executed by Messrs. LITTLE & BALLANTYNE on the Duke of DEVONSHIRE'S property in Chatsworth Square, in which, so far as planting goes, the present and the future, have been successfully studied, will be worth

from Carlisle. And as north-eastern trains run frequently in the course of the day to the spot, the opportunity can be easily obtained. Here rock and tree, and flowing water combine to make one of the loveliest scenes imaginable, and the visitor can roam at will in woodland walks, visit curious caves, and, guide-book in hand, muse on the glories of the past, until the scream of the steam-engine rushing across the beautiful viaduct which spans the Eden at this point, wakes him to a sense of the present.

By the kindness of the liberal-hearted proprietor, PHILIP HENRY HOWARD, Esq., the grounds are freely opened to visitors. About 13 miles further on the same line in the direction of Newcastle is Gilsland Spa, celebrated for its mineral waters, fine scenery, and historical repute, and consecrated also by the genius of Sir WALTER SCOTT in his novel of *Guy Mannering*. Here also Sir WALTER met his future wife, and the stone is shown where he is said to have popped the question. It is called the "popping stone." It is said to have a contagious influence, so, impulsive people, beware. In the neighbourhood are the fine ruins of Lanercost Priory, said to have been founded in 1116. Close in the neighbourhood is Naworth Castle, so intimately associated with Border history. It is the baronial residence of the Earls of Carlisle, and is open to visitors, who may spend many hours admiring its natural beauties, or examining the old furniture, pictures, and curiosities contained in the Castle. Eden Hall, the seat of Sir RICHARD C. MUSGRAVE, Bart., is about 18 miles from Carlisle, and can be reached by the Midland Railway to Langwathby, which is about a mile from the Hall. The scenery on this part of the line is very beautiful, as the River Eden can be seen at almost every turn—here struggling between abrupt, rugged, sandstone rocks, there lying placid like a lake, reflecting the massive, undulating sea of foliage which towers above its bed. The Hall is situated in one of the fine level holms which at intervals skirt the Eden, and is a fine old building, of a square style of architecture. The grounds are extensive, and in keeping with the Hall. Two splendid specimens of Cedar of Lebanon will be noticed on the lawn, and form a striking feature in the place. The flower-garden is well-filled, bold and striking effects having been carefully studied, but, of course, the beds are suffering, like most other outdoor subjects, from the excessive rains. The park is well stocked with deer and highland cattle, and is extensive, undulating, and well-wooded. The gardens are close to the Hall, but are entirely hidden by a fine old avenue of Limes. The principal plant houses are on the outside, facing the park, and are filled with some fine specimen plants and countless decorative plants, which are here required in large quantities. Stove, Orchid-house, and greenhouse accommodation are largely provided, and Grapes, Peaches, Melons, Cucumbers, &c., are growing in abundance. Sir RICHARD and Lady MUSGRAVE take great interest in the gardens and have lately made many improvements. It will be seen that Lady MUSGRAVE is presenting a beautiful cup at Carlisle for the best dinner-table decoration, and as her ladyship is to be one of the judges in this class, it is to be hoped there will be a good competition, as the cup will be a splendid trophy for the winner to carry away.

— A correspondent, writing from Brussels, informs us that about 9 P.M. on Tuesday, the 14th inst., a severe HAILSTORM passed over the Ledeburg, or east side, of GILBERT, smashing glass in all directions. Plants of *Ficus elastica* have not a perfect leaf left on them, all being cut through with the hailstones, which were as large as pigeons' eggs. The Azaleas standing outside had large branches broken off them, and Mangels in the fields look as though they had had a harrow run over them. The loss from breakage falls very heavy upon many of the smaller nurserymen.

— The *Denver* (Colorado) *Tribune* of August 2 contains some particulars respecting "the Hayden Exploring, Botanical, and Surveying Party," which had arrived in that town. The party consists of Sir JOSEPH HOOKER, President of the Royal Society and Director of the Botanical Gardens at Kew; Lieutenant-General STRACHEY, R.E., and Mrs. STRACHEY; Professor ASA GRAY, of Harvard University, the leading botanist of the United States, and Mrs. GRAY; Professor HAYDEN, a geologist who is charged by the United States' Government with the Geological Survey of the Territories; Mr. JAMES STEVENSON, Professor HAYDEN'S principal assistant; and Dr. LAMBORN, Vice-President of the Denver and Rio Grande Railway. The English members of the party were invited by Professor HAYDEN to accompany him on his official survey of the Rocky Mountain district and other parts of the United States territories, the object of the botanists being to make botanical investigations, especially upon the character and distribution of the forest trees. The *Denver Tribune* reminds its readers that Sir JOSEPH, then Dr. HOOKER, was

the botanist of Sir JAMES CLARK ROSS' celebrated Antarctic expedition. He afterwards explored India, especially the Himalayas; has made scientific explorations in Palestine, Morocco, &c., and for his services to science, and especially for his work in India, was recently made a Knight Commander of the Star of India. Lieutenant-General STRACHEY, who served thirty years in India, principally in the administration of the public works, is now a leading member of the Council of India. He made a full survey of the province of Kumaon in the Himalaya Mountains, and being much devoted to geographical and meteorological researches, is naturally very much interested in the great Rocky Mountain region. Professor GRAY is now making a second visit to the Rocky Mountains, in which, as a botanist, he takes great interest. He wishes to visit Gray's Peak, named after him, and also the adjacent Torrey's Peak, which was named after his late associate, Professor TORREY. Mr. J. STEVENSON has been associated with Professor HAYDEN for the past twenty-four years in his researches and examinations from our southern boundary to New Mexico. Dr. LAMBORN is an accomplished engineer, mineralogist, and metallurgist. Southern Colorado has already been explored, the mountains above George Town, Berthoud's Pass, &c., are now to be visited, and then the party will move on to Utah, Nevada, and California, for a rapid reconnaissance.

— We hear from Mr. CROUCHER, gr. to Sir PATRICK MURRAY, at Ochertyre, Crief, that the rainfall there between 11 A.M. on Saturday last and 9 A.M. on Tuesday, was 2.75 inches; and that owing to such excessive wet, the small fruits have all decayed on the bushes.

— Our Carlisle correspondent, writing on the 21st inst., remarks that it had rained there unceasingly for three days and nights, doing great damage to the corn crops and Potatoes.

— We are informed that the secretary of the Gardeners' Royal Benevolent Institution will, by direction of the committee, visit Carlisle on the occasion of the forthcoming show, with a view of extending the usefulness of the Society. Why should not some special means be taken on such an occasion to augment the funds of the Institution?

— The great beauty and high decorative value of ANEMONE JAPONICA and its varieties, when in full bloom, are qualities so often enforced, that it seems but vain repetition to again allude to them. And yet they are plants that will grow almost anywhere, that the wonder is they are not more frequently met with in road-side gardens both in town and country. In old-fashioned gardens they flourish, and lend a lustre to the summer glory of the flowers therein; but in modern gardens one looks for them almost in vain. As we write, a handful of flowers of *A. japonica*, intermedia, and alba are before us; the former is valuable because of its depth of rosy-purple, the latter for their soft colouring and splendid size. What enormous beads of bloom well established plants will throw, and consequently what a value they possess for cutting! The bunch of flowers just referred to have been in water for nearly a week, and kept in a rather close sitting room, and yet there is no sign of decay or shadow of turning. The plants want to be put out into a rich free loam, and there let alone as far as disturbing their roots is concerned. A good mulching with manure during the summer works wonders; its effects are seen in the heightened colour and increased dimensions of the beautiful blossoms.

— The AGRICULTURAL RETURNS which have been issued for Great Britain and for Ireland show the acreage under Wheat in the United Kingdom this year to be 3,311,859 acres, which is more than in 1876 by 196,202 acres, but less than in 1875 by 189,617 acres. The acreage under Barley is 2,643,511 acres, being less by 110,412 acres than in 1876, and less by 100,093 acres than in 1875. The acreage under Oats is 4,225,877 acres, or less by 59,719 acres than in 1876, but more by 60,001 than in 1875. The acreage under Potatoes this year is 1,383,993 acres, or less by 1811 acres than in 1876, and less by 39,246 acres than in 1875.

— Some time since we alluded to the success which had attended the efforts of Mr. JAMES ALLEN,

of Shepton Mallet, an enthusiastic amateur florist, to obtain seed from the shy CHEIRANTHUS MARSHALLII, a beautiful hardy perennial that is believed to have resulted from a cross between *Cheiranthus alpinus* and *Erysimum Peroffkianum*. A belief that is entirely borne out by the appearance of the progeny raised from Mr. ALLEN'S seed. The majority have a perennial habit, as is evidenced by the side growth formed at the base, but some could not be distinguished from plants of the *Erysimum*. With many the blooms are larger than is found in the *Cheiranthus*, and whilst some have flowers of a deep orange colour, others have flowers that could not be distinguished from those of the seed parent, *Ch. alpinus*. One particular feature marked these seedling plants, viz:—they possessed a very prolonged habit of flowering, and if cut from, would continue to throw out other trusses of bloom.

— A leaf of a species of *Spiranthes* lately received at Kew from Trinidad, infested with a PARASITIC FUNGUS, has just been forwarded to us. We naturally turned to *Uredo confluens* var. *orchidis*, but on examination we find the parasite is quite different, and does not belong to the same genus. It is, in fact, a species of *Trichobasis*, and is peculiarly interesting as occurring on a plant so lately imported. As the species is at least undescribed, though it is believed that it has before occurred on Orchids in cultivation, we take the present opportunity of characterising it. As the specimen was obligingly sent to us by Mr. R. IRWIN LYNCH, we have no hesitation in recording it with his name attached:—*Trichobasis Lynchii*, B., maculis parvis pallidis; soris sparsis raro confluentibus; pseudosporis flavis obovatis pulcherrime echinulatis, stipite brevi. *M. J. B.*

— A meeting of the inhabitants of Kew and Richmond was held on Tuesday at the Kew Institute for the purpose of recommending that the Gardens be opened at an earlier hour, and that the present unsightly wall, which has just been raised 3 feet, be removed. The Rev. C. P. Nott, vicar of Kew, occupied the chair. Mr. White proposed the following resolution:—"That the ROYAL GARDENS AT KEW having been dedicated to public use and enjoyment in the year 1840, and from that time maintained at the public expense, it is the opinion of this meeting that the same facilities for their free enjoyment should be afforded as at Hampton Court Gardens, Battersea Park, and other places, and that the present restricted hours of admission on week-days—viz., one o'clock till sunset—are arbitrary, unnecessary, and quite out of harmony with the spirit of the age, and this meeting hereby pledges itself to use all constitutional means to procure the opening of the Gardens at ten o'clock in the morning, without in any way interfering with the existing regulations regarding the houses." The motion was carried with acclamation. Mr. Cross next proposed—"That in the opinion of this meeting the present brick wall bounding Kew Gardens in the Richmond Road, which has been recently made more unsightly by being unnecessarily raised, should be removed, and a form of enclosure adopted similar to that in use at the public parks and elsewhere, thereby giving increased light and air, and adding very much to the improvement of so important a highway." Mr. LAYTON seconded, Dr. SELLÉ supported, and the motion was carried. Mr. DENTON proposed and Mr. STOCK seconded—"That a permanent Committee be appointed to give effect to the foregoing resolutions, with instructions to take such steps during the next Session of Parliament as they may be advised." The resolution was carried unanimously. Dr. ATKINSON proposed and Mr. FLETCHER seconded—"That a copy of these resolutions be forwarded to all the metropolitan Members of Parliament, the members of the Home Counties, and the various boroughs in the same counties." Mr. PETER WATSON proposed—"That a fund be raised, to be entitled the 'Kew Gardens Public Rights Defence Association Fund,' and that an account be opened with the Richmond Branch of the London and County Bank, in the names of the treasurer and two members of the Committee." A committee was then appointed and the meeting broke up.

— In a lengthy article on THE INSTINCT OF PLANTS, in the *Transactions of the Natural History Society of Modena*, Mr. RICCARDI comes to the conclusion that plants exhibit a kind of instinct in their various phenomena of movement. That is to say, the

periodic movements of *Desmodium gyrans*, the dropping and folding together of the leaves of *Mimosa pudica*, when touched or shaken, the fertilisation of *Vallisneria*, and other similar phenomena, illustrate instinctive action.

— AMONG hardy spring flowering shrubs or trees *CERCIS JAPONICA* is deserving of a prominent place. It is much handsomer than the better known *C. siliquastrum*, being of more symmetrical habit; and the flowers are larger and usually more abundant. The flowers appear in early spring before the leaves are put forth; and after the beauty of the flowers is past the handsome foliage succeeds them. For the sake of the very distinct foliage alone this, as well as the other species, *C. canadensis* and *C. siliquastrum*, merits attention. This small tree is exceedingly hardy, having borne, without injury, 45° of frost, as we learn from *REGEL'S Gartenflora*.

— Mr. PARKER, of Tooting, informed us the other day that he had recently seen *HABROTHAMNUS ELEGANS* flowering in a remarkable manner at the St. Arnold's Vale Nursery, Clifton. It seems that a strong shoot had got through the roof, and stood outside uninjured all through the winter, to flower at the present time with the greatest profusion.

— The great SUMMER SHOW OF THE ROYAL HORTICULTURAL SOCIETY in 1878 will be held in the Gardens at South Kensington on Tuesday, May 28, and will remain open until the evening of Friday, May 31. Schedules are now ready, and may be had on application to the Secretary. Arrangements are also being made for the provincial show next year.

— The *Frauentorfer Gartenschutz*, several numbers of which are before us, is intended as a practical handbook for amateur gardeners. The work is published by Arenz, of Munich, in parts, is illustrated with coarse wood-cuts, and treats of such subjects as the following:—Manure, tools, pots, propagation, improvement, watering, window plants, list of plants and bulbs worth cultivating—descriptions of them and mode of growing, list and mode of culture of vegetables, recipes for preserving fruit, &c.

— In a recent number of the *Bulletin Mensuel de la Société d'Acclimatation* appears a very interesting and exhaustive article on the CULTURE OF SUMAC IN SICILY. Sumac is a name known in commerce for the broken leaves and twigs of two or more species of *Rhus*—*Rhus Coriaria* and *R. Cotinus*. The former species only is referred to in the paper in question, and the article opens with a short description of it. In the second division of the article the region most suitable for Sumac cultivation is stated further on the choice of a site for a plantation, and the preparation of the land is considered as well as the minute details attendant on proper cultivation. A good deal of valuable information is given about the different qualities of Sumac. With regard to the colour, relative value, &c. The differences of the product, as obtained from different regions, is also considered. The statistics of the cost of Sumac cultivation in Palermo and Messina will be of value to many, inasmuch as information of this kind is not easily accessible. Altogether the paper is a valuable one.

— *CAMPEANULA PYRAMIDALIS* and the variety *ALBA* are strikingly ornamental at Kew, both in the conservatory and temperate-house. They are mostly grown in 24-sized pots, and have from six to eleven stems each. *LONICERA SEMPERVIRENS* VAR. *MINOR* is one of the best of the climbers in the conservatory, and is now flowering profusely. It has orange flowers in terminal clusters. Fuchsias appear as if intended to be seen from beneath, and nothing can be more beautiful than a plant of *F. Veous de Medici* here growing on the roof. Some *Lantanas* in this house are very richly coloured, but possess an unfortunate smell when bruised. *Didiscus coreuleus* is a very pretty annual both in flower and foliage, and may be included in the most choice selection.

— According to a recent report from Chittagong, it seems that there is great danger of the WOOD-OIL OR GURJUN OIL TREES (*Dipterocarpus turbinatus*) becoming in course of time exterminated. These

Gurjun oil forests are described as occupying "the outer hills from one end of the Hill Tracts to the other, and this distribution is so marked, that this class of forest hardly ever appears beyond the first watershed running from the north to the south." The chief tree here is the wood-oil tree, which grows to an immense size. The oil is obtained by incisions made in the trunk 2 or 3 feet from the ground, and these trees are charred periodically by fire, so as to induce the oil to flow more freely. Besides the oil, the timber is very valuable for planking and boat building.

— The TEAK TREES in some parts of INDIA are reported to have been considerably INJURED of late by the appearance of a GRUB. It is said to enter the young trees at about 4 feet from the ground, usually, but not always, at a knot. It eats round the trunk between the bark and wood, "then into the pith, and up and down the pith for not more than a foot in each direction." It has, however, been found upon examination that most of the trees fill up the part eaten away between bark and wood by fresh layers of sapwood. Trees thus attacked are liable to fall down, and if so, a new shoot comes from the stock. Many, however, grow on; but where the insect is still at work, a swelling takes place, which appears to be due to an effort on the part of the tree to fill the passage of the insect between bark and wood up again. This damage has been more particularly apparent in the Chittagong district; nevertheless, the conservator reports that at present it does not appear to prevent good Teak being grown in the locality.

— In a recent number we drew attention to the discovery, by Dr. BECCARI, of the botanical origin of the cane so well known in commerce as THE "RAJAH" CANE. We are now enabled, through the kindness of Mr. LOUIS A. BERNAYS, Secretary to the Queensland Acclimatization Society, to add the scientific nomenclature to one or two other commercial canes mentioned in an article on "Walking Sticks" in our issue of February 3 last. Mr. BERNAYS says that "Midgen" is the native vernacular for *Areca monstachya*; and that the canes coming from Cardwell, and called "Cardwell," are the produce of a tropical growth of *Calamus australis*. The stick known in trade in this country as "Loya" is probably identical with the "Lawyer" of Queensland, which is believed to be also the produce of *Calamus australis*, but from the cooler country about Brisbane, and less robustly developed.

— A very interesting account of the MEDICAL GARDENS AT BODICOTE, near Banbury, was recently published in the *Pharmaceutical Journal*. Henbane, Rhubarb, and Poppy are the principal crops grown over an area of between 60 and 70 acres in this little village. Mr. USHER has some splendid plants of *Rheum officinale*, now about five or six years old, and this species he intends planting largely, in which we think he is fully justified, seeing that a single plant dug up when we visited Bodicote a few days since gave a root weighing, when trimmed, somewhat over 31 lb.

— In a recent number of the *Illustration Horticole* M. ANDRÉ remarks on the appearance presented by ORCHIDS AT HOME. Accustomed to see them in our stoves, and at such a distance from the eye as to be readily examined, and their proportions estimated, M. ANDRÉ not unnaturally expected to find them in similar masses in a wild state. This, however, he tells us, is quite exceptional. In most cases the plants occur isolated, and amid the luxuriant and gigantic vegetation of the tropical and semi-tropical forests, their flowers appear small and even dull in colour. They are concealed amid a mass of gigantic or strangely formed foliage; they grow in the forks of branches as thick as casks, covered with a vegetation of other parasites. They are often high up on a rock, or a tall tree trunk. Each forms only a small item in the general effect. The Bromeliaceae, on the other hand, impress their own special characteristics on the localities in which they grow.

— The LEAVES of the common ELM, *Ulmus campestris*, are, as every one knows, arranged in two rows (distichous), and, owing to a slight twist in the petioles, are in the same horizontal plane, the edges, supposing the shoot to be held erect before the observer, looking upwards and downwards. The young twigs, moreover, are flexuose, or 2½-zag in

direction, and the leaves are oblique, or lop-sided at the base, the larger lobe, as it were, fitting into the recess formed by the receding stem. In a shoot of Elm before us this state of things is altered; the twig is perfectly straight, the leaves are in two rows, the petioles are not twisted, and the blades are therefore not in the same horizontal plane, their surfaces look upwards and downwards, and they are equal, not oblique, at the base. This is a very pretty case, showing how, by very trifling changes, an adaptation to circumstances may be brought about.

— Dr. BREITENLOHNER has communicated to the Imperial Academy of Sciences in Vienna the results of some investigations into the dependence of the TEMPERATURE OF TREES on external influences, carried out in conjunction with Dr. J. BOEHM. The following summary we borrow from the *Botanische Zeitung*. The temperature of the interior of a tree during the continuance of transpiration is the combined expression of the warmth of the air and soil. The warmth of the air is conducted transversely, and the warmth of the soil longitudinally. The longitudinal conveyance of heat is effected by the rising sap, as governed by evaporation. A lowering of the temperature of the soil during active transpiration causes a fall of the temperature of the interior of the tree. The influence of the temperature of the ascending sap decreases in the trunk from below upwards, and from the centre to the circumference. The extent of this influence depends upon the amount of solar heat conveyed horizontally, and is in exact proportion to the diminution in the size of the trunk, and the contiguity to its periphery. The lower part of the trunk remains under the full influence of the warmth of the soil as regulated by the rising sap. The upper limit of this influence loses itself in the ramifications of the tree. When there is no evaporation, and consequently no rising of the sap, the temperature of the tree is wholly dependent upon the temperature of the atmosphere. A simultaneous cooling of the underground and above-ground parts of a tree perfectly equalises, according to height, the sums of the two opposed forces.

— In the *Berliner Monatschrift des Vereins zur Beförderung des Gartenbaues* for July, in a report of a visit to one of the suburbs, mention is made of one establishment where Melons are cultivated on a considerable scale. In this particular establishment there were thirty-six twelve-light frames devoted to Melon culture. Each sash was about 40 inches wide, and sheltered two plants; and the average number of fruit in each frame was from eighty to ninety. Hot dung is the heating material employed.

— *REGEL'S Gartenflora* for June contains a coloured figure of *XEROPHYTA RETINERVIS*, a plant closely allied to the arborescent *Vellozias*, which give a peculiar character to the landscape in some parts of Brazil. It is a native of South Africa, and differs from a true *Vellozia* in having an unbranched stem, and few free stamens. The stout stem grows 4 or 5 feet high, bearing at its summit a tuft of linear leaves, something like a *Cordylina*, but clusters of leaves are frequently below the top. The lower part of the stem is densely clothed with the old brown leaf bases, which eventually split up into fibre. Protected by this fibre, the plant is constantly pushing out new roots at the top, which grow downwards until they reach the earth, like those of some Tree-ferns. From among the upper leaves appear the large solitary drooping purple-red flowers, which are nearly 3 inches long. This plant is a native of the mountains of South-Eastern Africa, at an elevation of 7000 to 8000 feet, and would, therefore, be nearly or quite hardy in the south-western parts of the United Kingdom.

— It is pretty generally known that there is usually a greater degree of VIGOUR IN THE HERBAGE OF MEADOWS and pastures immediately AFTER A CROP OF FUNGI, and this is specially striking in the so-called fairy rings. But this increased luxuriance is of short duration, perhaps only one season, and is succeeded by a less vigorous condition than that which existed before the invasion of fungi. The spawn of the fungi spreads from a centre, each successive crop of the fruiting state of the fungus being on new ground, and farther and farther from the centre in a more or less complete ring. Fungi are stated to be richer in nitrogen than any other class of plants, and this appears to be returned to the

soil in a state available as food for other plants. How and from what source fungi obtain the large proportion of nitrogen they contain is still problematical. Some two or three years ago, Dr. J. H. Gilbert contributed some particulars of the appearance of fairy-rings on the grass and experimental grass-plots at Rothamsted. The way in which these organisms feed, as well as saprophytes (plants which are destitute of green leaves, and which draw their nourishment from decaying organic matter) and root-parasites, is still obscure, and offers a good subject for investigation by those who have the time and means to conduct a long series of experiments. Quite recently M. BOUCHÉ communicated to the Berlin Horticultural Society some observations on the growth of *Lathræa clandestina*, a species closely allied to our native *L. squamaria*, and its influence on the development of the grasses and other plants forming the turf in which it was growing. This species of *Lathræa* is a native of Western Europe, and is commonly parasitical on the roots of Oak trees. A specimen of it was obtained and planted out in a meadow, which is often submerged, where it grew and bore perfect seeds. These were scattered about in various parts of the botanic garden, and sprang up, the young plants attaching themselves to the most diverse nurse-plants, such as *Gentiana lutea*, Willows, &c. The remarkable thing is, says BOUCHÉ, that everywhere in the meadows where it occurred the other plants with which it was associated were much more luxuriant than elsewhere in the same field. *Dactylis glomerata*, *Poa pratensis*, *Ranunculus acris*, and *Rumex Acetosus* were double and treble the height that they were in other parts. BOUCHÉ thinks this may be explained by the fact that *Lathræa clandestina* draws a great deal of moisture from a considerable depth in the soil, and parts with it abundantly where it is available for the use of other plants; and he recommends that experiments should be made by sowing it in meadows, with a view to obtaining a permanent increase in the crops. We have very great doubts whether permanently beneficial results would follow, and should hesitate about introducing a plant of this nature on a scale that would render its extirpation difficult, if it turned out in the long run to be injurious instead of beneficial. It is not stated how many years the *Lathræa* has been growing in the meadow, but it is stated that the crop of herbage in places where it occurs is three times as heavy as in other parts. In reply to a question, Mr. BOUCHÉ said that it preys indiscriminately on all plants, and that he had a specimen in a pot for nearly four years without any nurse-plant; but in the absence of a nurse-plant it gradually dwindles away and dies. It was incidentally mentioned that there was once found in the Berlin botanic garden a root-stock of *Lathræa squamaria* which was about a yard deep in the ground, and itself about a yard in diameter, and bearing hundreds of branchlets. It is supposed that its great depth was owing to a seed having fallen into a mole's hole. In connection with the above Mr. BOUCHÉ detailed his mode of procedure in cultivating this and some other parasites. As much compost, of a suitable nature, as is necessary to fill the pot in which the nurse plant is to be put, is taken and a small pinch of seed mixed up with it. In the course of time the seeds germinate at different heights, some of them quite at the bottom of the pot, some do not germinate for several years. Thus seeds of *Orobanché lupuli*, brought by Professor KOCH, from the Caucasus, lay dormant for four years.

— The genus RHAMNUS includes some shrubs with bold foliage, as *R. alpinus*, for instance, though, generally speaking, they are not very ornamental. *R. sibiricus*, however, is now very handsome in the pleasure grounds at Kew, being covered with dull red berries.

— When at Chiswick the other day Mr. BARRON called our attention to a valuable new fertiliser which he has been trying there for some time, and of the merits of which he speaks in the highest terms of praise. This is the ELIXIR OR BUFFALO HORN MANURE, introduced by Messrs. TAYLOR & Co., of Clapham, whose stock has passed into the hands of Mr. JOHN WILLS. It is exceeding light, and owing to its richness in nitrogen is quick and certain in its invigorating effect on all kinds of plants. Whether it is better than other horn shavings is we think doubtful.

ENTOMOLOGY.

THE CATTLEA BUG.—The injuries committed by insects upon vegetables may be classed under two separate heads—1st, those in which solid portions of the plant are removed, and 2d, those in which the sap or other fluid elements are withdrawn from it. In the first case, the insect must be provided with jaws for biting the leaves, twigs, or solid wood, and in the second, the mischief must be produced by an instrument for suction; and this dichotomous classification leads us, in fact, to the primary division of

FIG. 51.—CAPSUS CATTLEA.

insects in general into two great groups—the Mandibulata, or insects provided with jaws for biting, and the Haustellata, or those which have the parts of the mouth transformed into a sucking apparatus. At the present time we are in a scare lest one of the biting species of insects, the Colorado beetle, should invade our shores and bite our Potato stems and young foliage; while the same plant was, a good many years ago, supposed to be in a fair way of extermination by the sucking powers of *aphis vastator*, and, in fact, the researches of Mr. Worthington Smith on the

FIG. 52.—LEAF INJURED BY CAPSUS CATTLEA.

late lamented Mr. Alfred Smees' collection of microscopical preparations, made during the prevalence of the Potato murrain, have shown that, although the primary cause of the disease was a fungus, the insect had really something to do in disseminating the mischief, by introducing with its sucker into healthy leaves the germs of the fungus which it had imbibed with its sucker in the sap of diseased plants which it had previously attacked.

Horticulturists have not to be told that sucking insects, by their numbers, have power to destroy a plant, or even a tree. We all remember how completely the Red Currant crop was destroyed a few years ago by an aphid, and the unchecked action of these insects on a tree, by sucking and killing the young shoots and buds, for instance, if a Rose tree,

it often brings it into such a state of disease, as to cause its death.

The figures accompanying these remarks represent a leaf of *Cattlea Aclandiae*, recently imported into this country by Dr. Alexander Wallace, of Colchester, from Bahia. It is covered with small discoloured blotches, caused by the punctures of a small cimicidaceous insect, which was found alive sucking it. This action was so extensive as to prevent the flow of the sap in the leaf vessels. The insect itself is not a native of this country, and was doubtless brought with the plant from Bahia, as we possess several nearly allied species from Brazil. It is an elegant little creature, of a bright orange colour, and very glossy, with the antennæ, eyes, and tibiæ black; the scutellum and upper surface of the abdomen dusky, the latter with an orange margin; the fore-wings (hemelytra) of polished steel blue, with the fore margin orange, and the apical membrane hyaline at the tip, and blackish at the inner angle; the hind wings are blackish, with black veins. It is one-sixth of an inch (two lines) in length, and five lines in the expansion of the fore wings. I believe it has not hitherto been described, and thus suggest for it the name of *Capsus cattlea*. It is nearly related to several pretty British species, such as *C. danicus*, &c., one of which is very fond of sucking ripe Raspberries, to which it in such cases imparts the peculiar disgusting flavour of the tribe to which it belongs. I. O. Westwood.

Home Correspondence.

Potatoes Flowering.—The present season has been remarkable for the production of the greatest display of Potato bloom I have ever seen. It has been generally remarked, but none have attempted an explanation; neither can I, further than that I suppose the season has generally favoured the production of pollen. Of course the Potato in all seasons produces a certain amount of bloom, some kinds very profusely, others sparsely, whilst others rarely produce a flower, and never fertilise one naturally. I have found this year that the free-flowering kinds have not only bloomed abundantly, but have produced an enormous crop of seed Apples, and I could now gather up these literally by bushels. I have counted the produce of one bunch of bloom, as many as twenty seed pods—enough to produce nearly 1000 seeds. The sparse blooming kinds have blossomed very abundantly, and have fruited more or less, just as the pollen was abundant or otherwise, whilst the very rare bloomers have set a few flowers that have been artificially fertilised with foreign pollen, thus giving a chance to produce crosses such as seldom offers. I attribute to falling or otherwise of the blooms at an early stage entirely to the absence or presence of pollen, as I found all those that were artificially fertilised to set at once, whilst all the others in which there were no pollen dropped almost as soon as expanded. The early forms of the American Rose very rarely flower, and I greatly doubt whether until this year it has been possible to secure crosses upon any of them. Mr. Fenn endeavoured a few years since to obtain crosses with Extra Early Vermont, Snowflake, and Vermont Beauty, but failed for want of flowers or of pollen, and was enabled only to cross with Late Rose and the Willard. This season I have been able to secure seed Apples on the Extra Early Vermont by the application of pollen from Early Market and Hampshire Hero—a new first early white kidney, and I shall be much surprised if out of these I am not able eventually to produce an entirely new strain of early Potatoes. A white Early Rose having the quality of our best white kinds would soon put the old Ashleaf out of cultivation [?]. Another cross of an Anglo-American kind has been obtained by fertilising flowers of Success with pollen of Woodstock Kidney—one of Mr. Fenn's finest new main crop varieties. Success is a new American sort, a robust Snowflake, and carries bloom freely; but as it is devoid of pollen, every bloom but the pair so fertilised has fallen. Such a cross as this should produce a remarkably fine strain of white kidneys suitable for market and main crop, and I have little doubt but that some such result will follow. In coloured kidneys I found size and very good shape in Superior—a new red American kidney, certificated at the International Potato Show last year. This has a fairly robust haulm, and flowers freely, although, like all other American kinds, it carries seed apples only on artificially fertilised flowers. This variety was crossed with Mr. Fenn's Bountiful, the most prolific, handsome, and best eating of all red kidneys, and it is but reasonable to suppose that the progeny of such a cross will be of a very promising kind. Another coloured cross, with entirely different sorts, has been obtained, the beautiful round Lye's Favourite being the seed parent, and the pollen

parent the fertile Blanchard. Both of these are very handsome show kinds, one being blotched with carmine and the other with purple, and may produce a very pretty strain. Porter's Excelsior has for the past two years proved to be the very handsomest white round Potato, but unfortunately its quality is far from being all that could be desired. In the hope of improving it, I have crossed it with Fenn's Early Market, and now regret that, while yet there was a possibility, I did not also use upon it pollen from Rector of Woodstock, as I regard this as one of the very best eating Potatos in cultivation. There is as much difference in flavour and in eating quality in the Potato as in the Apple, and those only can realise that who have a large number of kinds at hand for consumption. One other cross made at the last moment as likely to produce something good in coloured rounds is between Radstock Beauty, a new flattish white round, much flaked and blotched with red, and the new Scotch Grampian, a robust red of the Emperor type, that produces very handsome tubers. Some readers will smile perhaps, to hear that I have been intercrossing the Potato, Tomato, and the Solanum Pseudo-capsicum, of the results of which it is yet too early to write. An eminent nurseryman recently remarked that he hoped we should have no more new sorts of Potatos; perhaps he would not have appreciated such a remark had it been applied to Roses or Pelargoniums, for there is just as much good reason to continue to raise new kinds of one as the other; in truth, to stand still in these matters means stagnation to trade in horticulture. We must be moving in small things as in great ones. No one can tell what good kinds may grow out of these Potato crosses, nor what benefits to society may result. *A. D.*

The "Elixir," or Buffalo Horn Manure.—I observe an advertisement in the *Gardeners' Chronicle* for August 18, declaring the above to be "the very best manure in present use." And as this opinion is backed up by Mr. A. F. Barron, and other well-known gardeners, I would like to give it a trial. But before ordering a supply, I beg to ask Mr. Barron, or any of those whose names are appended to the testimonials in its favour, if they ever tried horn shavings from the combmakers, usually sold at about £10 to per ton? If so, will they kindly state the difference between "the Elixir" and cattle-horn shavings. I have for years used the latter, and have at all times found it an excellent manure for Vine and fruit tree borders, orchard-house, trees, Pines, Strawberries, Vines in pots, &c. *J. McIndoe, Hutton Hall, Guisborough.* [We find that the analyses state that Buffalo horn is a trifle richer in nitrogen than most other horns or hoofs. *Eds.*]

Amaryllis reticulata.—I think this plant is too much neglected. It is a most handsome plant, both in flower and foliage, the white stripe down the middle of the green leaf making it very striking. It is a much easier plant to bloom than many persons suppose, if it is only treated right. It is too often over-potted, and the bulbs too deeply inserted into the pot. It should be kept quite above the mould; it should be potted in good peat, well-mixed with one-third of rough sand, and the pot well-drained, and then be placed in heat. When the bulbs are large enough to bloom, withhold the water for two or three weeks, and keep the plants in a cold house; then place them in heat, and they will soon show their flower-stem, which is very beautiful. I treat all this most beautiful family in the same way, and generally have two or three plants in bloom all through the year, and find them most convenient in 6-inch pots for drawing-room decoration. The best and freest flowers are *Alicia splendens*, *vittata*, *Johnsoni hybrida*, *Prince of Orange*, and *reticulata*. *William Smythe, The Gardens, Basing Park, Alton, Hants.*

Potatos Self-sown.—Having read the remarks on self-sown Potato seed in your last issue, I do not consider it unusual in such a mild climate as the South of Ireland, and particularly in dry peaty soils, for such to grow, as it were, spontaneously. When employed at Thomastown Castle, in the South of Ireland, I have frequently observed in the forcing ground in the gardens, where peat was used for blanching vegetables, and in other places where it was used as a protecting material on the roots of plants from the effects of frost, many kinds of tender plants grow naturally, amongst which were Potatos, Tobacco, Ice-plant, &c. The seeds must have come from places near at hand, where such things were grown and were preserved by the peat till the time of germination came. I consider sandy peat soil, when dry, has the property of resisting the effects of frost on roots and seeds of plants, and, therefore, it is a good material for protecting them, as it retains a high temperature compared with other soils. I put some Rose plants in stock in the month of January in peat, merely covering the roots temporarily to protect them till planted. I was much surprised to find, on taking them out three weeks after-

wards, that they had made many new roots, although there was no appearance of growth on the buds or the heads, and the weather was not mild. I have paid much attention to the raising of Potatos from seed, not so much for the purpose of obtaining new varieties as to prove if new kinds would resist the blight. The only difference I found was that the new kinds were generally of a more vigorous growth, and resisted the disease longer. Some of the new kinds were grown from French, and some from American seed. *John J. Goughyan, Liverpool.*

Carya tomentosa.—The branch and fruit sent herewith are from *Carya tomentosa*; this and the *C. amara*, and also the Black Walnut, are fruiting here very freely this year. They are making magnificent trees. It is a matter of wonder they are not more frequently planted. *G., Bath, August 21.*

Crawford's Early Peach.—This variety "which is not so highly esteemed generally," has withstood the effects of this inclement season better than any other variety which we cultivate, which comprise the following kinds:—Royal George, Early York, Rivers' Early York, Belle Bunce, Stirling Castle, Dagmar, Early Beatrice, and Early Silver, and this is a fact worth recording. *George Thomas Miles, Wycombe Abbey.*

Severe Thunderstorms in East Anglia.—The week ending August 18 was distinguished by the number and violence of its thunderstorms, and the heaviness and amount of its rains. During the whole period the electrical state of the atmosphere has been unsettled, and that over almost the whole country. Suffolk was visited by two or more very severe thunderstorms, that on Wednesday spending its chief force seemingly in the neighbourhood of Hadleigh and Newmarket, and the Thursday storm choosing the town and immediate neighbourhood of Bury St. Edmunds for its centre. The latter storm lasted from 4 to 6 P.M., almost without intermission, and reached its climax a few minutes before 6. About that time two trees, a Poplar and an Ash, were struck at the two opposite sides of the town, and a cottage in the town itself. In the latter the lightning seemed to have come down the chimney and carried away the wooden mantelshelf and a few of the bricks, making its exit by the open door, and also breaking some squares in the window. An old person who sat by the fire at the time felt the lightning singe his hair, but was otherwise unharmed. The Poplar tree was struck on one side, and part of it splintered off in the usual way with trees struck with lightning. The Ash was struck about ten feet from the ground, the tree rent considerably in both directions, and, being hollow at the spot where struck, and containing starlings' nests and refuse, was set fire to by the lightning, and continued to burn fiercely from 6 o'clock to 10.30, or more than four hours, when the head and upper part of the trunk fell with a great crash. The tree was a very large one, and being close to the town it attracted a great many people. It burned with a fierce red light, every now and again giving out jets of flame almost like fireworks, and as if the lightning had left some gaseous matter in the tree. Over a small area having Bury for its centre, a severe hailstorm fell, lasting less than ten minutes. The rain was the heaviest I ever remember. Walks, terraces, flower-beds, borders, grass, lay all flooded, a depth of from 4 to 6 inches. Another curious incident happened in these gardens. In a house occupied partly with a collection of bulbous Begonias there was a broken square of glass. The lightning entered through, seized and cut off a large branch of one of the plants, an inch or so above the ground, leaving a clear horizontal scar, as if a sharp piece of hot iron had been suddenly drawn through the limb, which was nearly half of the entire plant. These severe storms, rains, and the close, disturbed state of the atmosphere are telling fearfully on the Potatos, which are going very fast indeed. They are also very injurious to the grain crop, and make harvest operations drag slow. To-day, however (August 21), the air is cooler and clearer, and a brisk west wind blows, and corn is being stacked in all directions. *D. T. Fish.*

Mimulus cupreus and *maculosus* are things that have done very well this year with plenty of moisture; they have made rampant growth and flowered, and still are flowering very freely. A pinch of seed should be sown in April in a box or pan, and when big enough they should be pricked out in the beds they are to occupy without any more ado. This is all the work necessary for them. They are very beautiful and interesting when coming into flower, so varied are the colours and forms of the flowers. They are perfectly hardy if protected with a layer of leafmould or ashes. *K.*

Beech Mast.—The Beech trees in the plantations here are this year bearing prodigious crops of mast, so much so as to look quite brown with them at a distance. In general, the Beech only bears good crops of mast at intervals, but I have never before seen them so loaded as this year. The wood pigeons and

wild ducks will not want for food this autumn and winter, for they feed ravenously on them in the woods here when the mast is plentiful. The Spanish Chestnut has flowered much later than usual this summer, and there is not much chance in the Midland Counties of any fruit ripening. It is only in the very warmest summers and autumns that the fruit here gets to any size and ripeness. The Walnuts in this district are a very thin crop, and there are very few to be had for pickling purposes. *William Tillery.*

Lobelia, St Martin's Blue.—Notwithstanding the very heavy rains we have had this season, this Lobelia has remained compact in habit and true to its colours; not a flower or leaf among the thousands of plants I saw at St. Martin's on July 30 had sported in the least. The rich blue of its flowers and fine dark bronze foliage stamp it the first Lobelia of the day, and I think Mr. Ross has good reason to be proud of the way his seedling has stood the trial of such a season. *J. Marshall, Moutrose.*

Cucumbers eaten by a Cat.—In reference to this subject, another correspondent says he knows of an exactly similar experience with a dog. The dog, however, was not suspected; but he was at length caught in the act of eating the Cucumbers with as much apparent relish as meat. [*Eds.*]

Sedum glaucum.—To lovers of raised edges of carpet beds I find this one of the most elegant and most useful of plants. If planted before laying on the Echeveria glauca, it gives a fine finish to the beds, and is easily kept in order. It is easy to increase, and will stand any amount of hot dry weather. I have two large beds treated in that way. *William Smythe, The Gardens, Basing Park, Alton, Hants.*

The Premier Strawberry.—I can fully endorse all "A. D." said respecting this variety in the *Gardeners' Chronicle* of June 30. It is a first-class variety. The crop on our heavy soil has been good. Fruit large, well-coloured, but the flavour not so good as last year. The heavy rains at the time the fruit was ripening, no doubt, was the principal cause. Vicomtesse Héricart de Thury has done well with us. Fruit large (for the kind), and the crop very heavy. I have picked 1 lb. of large, well-ripened fruit at one time from a plant two years old. I consider that the two kinds mentioned are not to be beaten for early work. *J. Weaving, The Gardens, Bytlets, Penbridge, Herefordshire.*

The Weather in Yorkshire.—In addition to the disastrous failure of the fruit crop in the north of Yorkshire, we are now witnessing a complete failure in the flower garden. The late cold spring caused the planting out to be very late, and then the north-east winds stung many of the tender plants past recovery, excepting in very sheltered places. The Pelargoniums here have not done well; the tricolors are certainly wrongly named this season, and the dripping weather for the last five weeks has destroyed all the bloom on them, and no fine weather can make up the loss now, as the nights will be too long and too damp. The Coniferous plants are the only plants that seem proud of the weather; those certainly do look well. The few Apricots we have can never ripen; in good seasons, if they do not ripen before or about the 25th of this month, they are of little worth. Apples are very late and small, and not likely to be more than half the usual size. The rain we have had this season is nearly 7 inches in excess of last year, and is likely to be very disastrous to the corn crops in this part of Yorkshire. On August 8 we had a severe hailstorm, which completely riddled the Lettuces, Turnips, French Beans, in fact, all soft leaves, and laid much of the cereal crops. On August 14 we had another thunderstorm, and 1 inch and twenty-seven hundredths of rain fell in one hour and twenty minutes. The next day brought another severe storm, but in this we did not suffer so much as our neighbours; but the half-hour's rain left us just half an inch. It has rained on sixteen days of this month; to-day we have had a regular downpour, and I fear at 9 o'clock to-morrow morning I shall have to add a large figure to the amount already down. I may add that the Potatos have become badly diseased in the last week. If we have no change very shortly it will be very serious both for the corn and Potato crop. *William Culverwell, Thorpe Perrow.*

Potatos.—The Potatos now in use here, the Dal-mahoy, are very good, but, I am sorry to say, the disease is spreading rapidly throughout the neighbourhood. This has been the wettest season I ever remember. One of the oldest inhabitants I know says there has not been such a season since 1840. Very few of the Potatos flowered, and the few blooms that came dropped prematurely. The Regent varieties do very well here. I have this year planted about half an acre of Patterson's Victoria (imported seed), they are at present looking well and apparently

free from disease, although one-third of the tubers refused to germinate when planted. *W. A. Emery, Kilkca Castle, Maganery.*

Notwithstanding the use of "Salus" and other remedies that have been suggested from time to time, nothing appears to arrest the spread of the Potato disease, which during the past week or so has shown itself in the most virulent form. Crops that looked flourishing and well, and were apparently without a speck during the early part of the month, are now leafless, and smell most offensively, but as yet I do not find that it has affected the tubers to any serious extent. That it will do so is only too certain, and it is quite lamentable to look on the gardens and fields round about, and think of the loss the labouring classes and the country at large will sustain from the havoc the disease has already wrought, for, should the tubers remain sound, the check received must lessen the bulk at least one-half, as all the late kinds were in full growth, and will not now swell any larger. If we are to stamp out this disease, it must be done by growing early varieties that can be lifted and harvested by the end of July or middle of August, as it is generally about that time the dread spot first makes its appearance. There would be a double advantage in doing this, as the ground would be set at liberty for other crops which would pay far better than allowing Potatoes to stand till the autumn, and run the risk of losing the greater proportion. Fortunately we have among the early sorts several of first-rate quality, and that are very productive and good keepers, and why people should persist in growing others year after year with the same unsatisfactory result is incomprehensible. Most of the American kinds are very precocious and great croppers, and it is to be hoped that they may prove useful for crossing with some of ours to impart these good qualities, and infuse fresh strength and vigour, as no doubt they will, if those selected to breed with them are judiciously chosen. It is evident, from the experience of the past thirty years, that this is the only way to fight the disease, as it would leave nothing for the fungus to exist on unless, unknown to us at present, it lives on the foliage of other plants, and begins to propagate itself at the season we see it. The Potato must have had a wonderful constitution, considering what it has had to go through with disease and bad treatment, or it would have been worn out from sheer exhaustion long ago, for generally when the crops are lifted they are huddled together in large masses, where they sweat and get warm, and continue to sprout, till they are robbed of much of their vitality. This should not be allowed to take place, and may easily be prevented by storing them in shallow hampers in any cool place where air can be freely admitted, so as to keep the temperature as low as can be done during the winter without getting them frozen. Stored in this way the tubers lose none of their weight or energies, but start slowly and strong at the proper season, and afford double the produce they do after having expended themselves in premature sprouting. By paying more attention to the storing and growing only such kinds as can be lifted early, I am strongly of opinion that the disease may ultimately be stamped out, or so far held in check as to do but little damage; and I would, therefore, urge on all who have anything to do with cultivating the noble tuber, to give this matter the attention it deserves. The best thing that can be done now is to at once set about securing those that are sound, and to utilise such as are not by boiling them and pounding them up while hot, with plenty of coarse salt strewed amongst them as the operation proceeds. Managed in this way, and shut up close from the air, they keep fresh and sweet for a long time, and form an excellent diet for pigs, to mix with bran or meal, on which they soon fatten. Any that are intended for seed should be left on the ground for a few days, till their skins set sufficiently for them to be handled without being damaged, when they should be laid thin in any open, light, airy shed till the autumn, to be then transferred to safer quarters. Many think that if Potatoes are lifted before they are ripe they will not keep, but this is quite a mistaken idea; for if treated as above they do so equally well with any that are fully mature. This I have proved again and again, and I always make a point of digging the whole that are required for seed directly the disease makes its appearance, and by so doing it is very rare that it affects any of the tubers, which if left for a few days after the leaves and haulm are stricken would become tainted and soon rot. *J. S.*

The Potato Disease.—What might be regarded as almost a phenomenon in relation to the Potato disease, was noticed here on the morning of last Wednesday week. Previously the Potato had looked well, and had maintained a fairly vigorous foliage, but on looking over the tops that morning, whilst yet moist with the heavy dew and white mist that prevailed, I found that all the leaves and stems were covered with the fatal spot, literally reeking with decay, and when the hot sun came out the haulm was

charred as though it had been burned. It was as though a destroying agent had passed over and dealt forth disease and death in a few hours. To many persons who have been profound believers in the electrical theory this sudden attack of the disease will be looked upon as proof positive that electricity was the cause, especially as the atmosphere was during the previous evening heavily charged with it, lightning being constantly present in the clouds. I rather attribute it to the prevalence of the soft, thick, white mist and heavy dew, perhaps the first of such visitation we have had all the summer. The late heavy rains best served to wash the fertile spores of the *Peroospora* from off the leaves, but this heavy dew just served to germinate them and promote their rapid expansion, hence the millions of spots observable that morning. I too greatly fear that we shall soon hear sad accounts of the state of the Potato crop, and unless the dreaded beetle soon appears it will not find a green leaf to feed upon. *A. Dean, Balfout.*

Rating a Vinery.—Will you kindly favour me with a little information, regarding the rating of Vineries. I put up a large one last season which cost £373 for the building alone, which sum I stated to the assessor. I also stated that it would be unproductive for three years. I may mention that the produce is to be sold, but in the face of that, my statement, the assessor has sent me a paper assessing me for £30 per annum; which will amount to a considerable sum as proprietor and tenant; I also pay a feu yearly for the ground connected with it amounting to £8 5s. 4d. As I think they have overstretched the mark, perhaps you will be able to assist me with some information, as the same law holds good in Scotland as in England. *W. Harley, George Street, Perth.* [It is impossible for us to say at what exact sum Mr. Harley's vinery should be assessed; but when appealing to the Court he might urge the following arguments. 1. The vinery was built for a special purpose, and, therefore, the temperature required for Grapes, and even the plan of the house, render it useless for other purposes. 2. From the nature of the produce intended to be cultivated, no return will be made for three years. 3. In the face of this last fact, it is obviously not the intention of the Act that the vinery should be rated as a "productive concern" at present. 4. In accordance with the intention of the Act, the sum at which the vinery should be rated is the amount of what it is worth now to any one desiring to grow Grapes; not what it may be worth in three years' time, nor what it would fetch if turned to other uses. 5. It is now nothing more than a "warehouse" for the roots and branches of the Vine, and on the principle of decided cases should be rated as such, and not as a productive vinery, which it may be in the future. No cases are to be found deciding the question of the rating of glasshouses. Market gardens as a rule are the highest rated of any land because they are so profitable, and because their situation in proximity to a town makes them specially valuable. (*Brown on Rating.*) Eds.]

The Influence of the Bud on the Stock.—In connection with this subject I have a record of twenty instances which came under my notice last spring, in which the buds of *Acer Negundo variegatum*, affected the stocks on which they were growing, below as well as above the point of insertion. In each case there were several shoots disposed on all sides of the stem, with all their leaves variegated somewhat in the way of the variety propagated, and many of these leaves I could not have distinguished from the others. I dare say these instances would have been lost to science had I not at that particular time been considering the subject of the flow of the sap, whereby I was prompted to instruct the men before they commenced to disbud, to leave untouched any variegated shoots that they might find. The proportion of affected to the apparently unaffected stocks was 20 to 1000. Four years ago I had twenty-seven common Ash stocks budded with *Fraxinus americana acucubifolia* (so named from the way in which the leaves are variegated) at heights varying from 2 to 4 feet from the ground. Nearly all united readily and looked well until the following spring, when the majority of the buds separated and fell from the pieces of bark that were inserted with them; only three pushed into growth. At present they are all growing together as they did then, but two-thirds of the number are more or less completely inoculated with the colouring matter of the variety propagated, below as well as above where they were budded, and on all parts of the plants. One interesting feature in these instances of inoculation is that the variegation of the leaves of the stock and variety propagated is the same or similar; but, although such is the case with the Ash, I cannot see that the specific character of the leaves of *F. americana* have been transferred to the leaves of the stock, *F. excelsior*. From the instances above given, and others of equal importance recently and at other times observed by me, I have reason to believe that instances in which the bud and scion influence the stock are of more frequent occurrence than is

generally believed, and are to be found if carefully looked for. But it is evident that no great physical change in the stock, such as specific alteration of the leaves, as an effect of the scion or bud need be looked for; and I doubt if it can reasonably be claimed that the stock exerts a greater influence on the scion than the scion does on the stock. It is true, as was lately mentioned in your paper, that Pears when grafted on the Quince are unnaturally gritty—a clear case of the transmission of the properties of the gritty-fruited Quince—but I don't recollect having seen or heard of a Quince-like leaf on a Pear tree. On the other hand, I have had considerable to do with the grafting and budding of portions of variegated plants on to green and more or less closely related stocks, and, although I have seldom seen their colour-peculiarity affect the stock, I have also less frequently seen the variegation disappear as a consequence of such union. *George Syme, Elvaston Nurseries, Borrowash.*

Orchid Sales.—The complaints made have done good service. I see in the last catalogue a query set against "doubtfuls," and the names of the vendors. In future where these are not given the buyer will know that he must look to himself. But it is necessary to protest against another practice. A short time since a quantity of *Odontoglossum Alexandræ* were sold in pots that showed fine old bulbs with young growths that appeared to be from those bulbs. Myself, Mr. Marriott, and others, bought, believing the plants to be as they appeared, estimating their value, as usual, by the size of the pretended parent bulb. An accident raised suspicion, and on examination of the plants, all of them were found to have been thus made up. I wrote to Mr. Stevens, calling it what it then seemed to be. With his usual anxiety for fair dealing in his rooms, he at once sent me the name of the vendor, of whom I have asked for an explanation. The answer in substance is that it is the "custom" with nurserymen so to deal with plants in pots. He says: "The custom of making up plants has been practised for very many years. I did not originate it, and when I have bought plants at Stevens's, and when my Orchid growers have told me afterwards, as they often have, when repotting the plants, that instead of being a single plant they were several little pieces, sometimes mere scraps put together, and sometimes small plants with large, I should have felt myself wrong to have reproached men occupying honourable positions that they had played a trick upon me and upon the public. . . . I and my Orchid growers in the most innocent way have only fallen into the general custom. . . . From the many plants I have bought from time to time it never entered into my mind that such a thing could be a deception." This is an ample explanation, and I accept it willingly. "Custom" is a sufficient excuse for the individual who acts upon it. But as a buyer and on behalf of buyers, I must protest against such a custom. It cannot be too soon abandoned, for now that it is known to exist buyers will be shy. *Edward W. Cox, Mead Mount, Mill Hill, N.W., Aug. 18.* [Mr. Stevens informs us that the "custom" objected to by Mr. Serjeant Cox was quite unknown to him, and that he does not believe it to be generally adopted by the trade. Small plants of about equal size and value are sometimes grouped together to form a mass for show or other purposes, but never, to his knowledge, with the intention to deceive buyers. Eds.]

Foreign Correspondence.

COLORADO BEETLE IN CANADA.—Persistent picking by all the Potato growers in this neighbourhood has lessened the virulence of this pest to perhaps one-tenth of the damage sustained at the commencement of the present season, and this without poisoning our ground; and we beg leave hereby, for the benefit of any unfortunate cultivators of the delicious vegetable aforesaid, who may be visited by these creatures, to enter our solemn protest against the use of Paris green, or any other mineral poison, to destroy not only the offending insects but also the enemies now occupied in the destruction of the eggs, and bugs and beetles themselves. Not many miles from this place horses and cattle have been poisoned by eating the sprinkled haulm, and in the eastern provinces even the poor little sparrows, that have cost so much to import from England have been sacrificed to this mode of destroying the enemies they would have dealt with in the ordinary course of nature.

We have our usual assortment of grasshoppers of all sizes, from tiny ones of a quarter of an inch long to large ones of 2 inches dimension; but the number seems to decrease every year. A considerable proportion of them have wings, and whenever approached take to flight, displaying their dark green wings edged with a dullish yellow, and making a snapping noise with every motion.

Our prospect of Grapes and Plums is good, but for Apples only middling. *John Morren, Elm Farm, Minsing, near Barrill, Ontario.*

ORNAMENTAL TREES IN FORECOURT GARDENS : WHAT TO AVOID.—Looking across the road at a neighbour's garden a few days ago, we saw the jobbing gardeners endeavouring to improve on Nature, and achieving that amount of success which usually falls to his lot—a piece of burlesque gardening. A line of six fine specimen *Arbor-vitæ* were flanked at each end with a single scarlet *Thoro* on a standard stem. These *Thorns* had made a free growth this season, and were a little ragged in appearance, and some of the branches overhung the pathways to the houses. One jobbing gardener thought he would imitate the form of the *Arbor-vitæ* in the matter of pruning the *Thorns*, and by means of a pair of shears, he clipped the heads short all round to give them a kind of globular appearance. With a few fell strokes he destroyed the natural character of the growth of the trees, and with that, in a great measure, the chances of blossom for next year. They are now most unsightly-looking objects, and the arboreal line of beauty is completely destroyed. Such then is one aspect of ornamental gardening from the stand-point of the jobbing gardener. Such a style of pruning should be avoided by *Villa* gardeners.

A few years ago, when coniferous trees were all the rage, it was the gardening fashion of the day to plant coniferous trees almost everywhere, and especially in forecourt gardens. *Cedrus deodara*, *Araucaria imbricata*, the *Spruce Fir*, and sometimes *Cedar* of *Lebanon* were prime favourites. In a great many cases the frost so destroyed the *Araucarias* that they had to be removed; but as a general rule the others did pretty well, and the *Deodars* grew with amazing freedom. But little thought was given at the time as to future space for the trees when the time of vigorous growth set in; and the consequence is that many of them have outgrown the space allotted them; and where there is space they have so spread their growths as to darken the rooms of the houses, summer and winter alike.

The difficulty lies in pruning such trees; for if they be cut in much, the natural beauty and symmetry of growth is lost. Unless the breadth of the base of the plant corresponds to its height, a *Cedrus deodara* is not nearly so handsome and imposing in appearance as it otherwise would be. We know several gardeners who were once very proud of their *Cedars* till they overgrew the confined space allotted them, and now they regard them much in the character of a white elephant, and could wish themselves quit of them.

The courage that will boldly face some judicious thinning out is also sadly needed. When many forecourt gardens were originally planted, the great aim was to give them as finished an appearance as possible, and plants were put in thickly to secure this. But as they began to increase in size, and impede each other's growth, necessity arose for some thinning out, so that certain trees intended to become permanent objects should have ample space in which to make their growth and develop their natural beauty. But human nature appears to be in the main eminently conservative in these matters; but it is at a serious cost, of which a number of illustrations can be afforded in the suburbs of London and other places. The result is, the almost entire destruction of the symmetry of all the trees, owing to their having so grown one within the other. This idea was forcibly impressed on our minds by what we saw in the way of *villa* planting on the banks of the *Windermere Lake* a few days since. Coniferous plants had been largely used in laying-out grounds when residences were first built; they were planted as close together as ninepins; and now that size had been obtained without thinning, all that was presented to the eye was a higgledy-piggledy mass of varying forms and hues, without a spice of artistic execution to lend a lustre to the natural beauty of the individual specimens. The individuality of every example had been sacrificed to secure—a copse or juggle, for it was but little better.

If only some more intelligent oversight were given to the planting of fore-court gardens, the results would be much more satisfactory than they are generally. A few trees and shrubs, judiciously chosen and arranged should form the enduring features of the

garden. They should be healthy, well-developed specimens, in order to lay the foundations of arboreal excellence. They should be planted properly too, an advantage which is too often denied to them. Then if it be necessary to furnish a garden speedily, let some quick-growing shrubs, &c., be mixed with them, but to be removed as occasion arose for freer breathing and growing quarters for the permanent examples. And while trees are growing into size, the spaces between them can be utilised during a good portion of the year for planting tall growing flowering plants, as *Hollyhocks*, *Dahlias*, *Pampas-grass*, *Ricinus*, *Chrysanthemums*, *Sunflowers*, *Delphiniums*, *Phloxes*, and many other things that will readily suggest themselves to the planter.

Apiary.

LIGURIAN, OR ITALIAN BEES.—I have heard so much about these interesting foreigners, and also read very much about them, written by those who, of all men, should certainly be the best judges, because they simply record their experience; and in these things, without doubt, practical knowledge is the most valuable. To explain my meaning, I have seen them described thus:—"These bees are larger, more beautiful and hardy, more prolific, and more industrious than the common bees; they swarm earlier and more frequently, are less inclined to sting, more disposed to rob, and more courageous and active in self-defence." If I had read no more than this short sentence, it is enough to make me desire to know more about this novelty. However, this is not all, for Mr. Brackett, an American apiarist, states:—"My experience thus far satisfies me that the Italian bee has not been over-rated. The queens are larger and more prolific; the workers, when bred in comb of their own building, are larger, and their honey sacs larger. They are less sensitive to cold, and are more industrious."

Langstroth declares:—"If I may judge from the working of my colonies, the Italians will fully sustain their European reputation. They have gathered more than twice as much honey as the swarms of the common bee. This honey has been chiefly gathered within the last few weeks, during which time the swarms of common bees have increased in weight, but very little. The season here has been eminently unfavourable for the new swarms—one of the worst I ever knew—and the prospect now is that I shall have to feed all of them, except the Italians." In a trade circular I see it stated, "Their beauty of colouring and graceful forms render them an object of interest to every person of taste. My colonies are daily watched and admired by many visitors. So far as my experience has gone, I find every statement in regard to their superiority sustained; they will no doubt prove a valuable acquisition to localities of high altitude."

My experience of these active and pretty bees was at first a rather doleful one. A young queen was presented to me, by a gentleman whom I had befriended on many occasions; it came a long journey by rail on a cold autumn day, together with about twenty *Ligurian* bees; I lost no time in transferring it to a strong healthy stock deprived for some time of their own queen. Apparently they took to their new sovereign with much joy, and seem pleased of their new queen; but judge of my disappointment to find her dead, laid by her sorrowful subjects, I suspect, near the entrance of the hive. I was wise enough, however, to preserve the black queen, for this fortunately saved my stock.

The following season I succeeded in procuring another queen, and succeeded also in transferring her to a stock. At the time, I rejoiced in owning nineteen strong vigorous stocks, fourteen of these were at home, the others were kept by a cottager in the country. Spring came, when I naturally expected my *Ligurians* would be active and prosperous; however, they were contrary to all my expectations, dispirited and indisposed for work. After waiting another month to observe the young bees, I was surprised to find none. The hive being an ordinary skep, I could not examine it to find a reason for this; however, they gradually, but surely, declined in numbers daily, until, about July, I do not believe a hundred remained alive. To make matters worse, several of the adjoining hives began to have the same dispirited look. At length, when it was too late, the dreadful truth dawned upon me, that it must be the

foul brood. To make a long story short, I lost the whole of my apiary, for I was reluctantly compelled to destroy both the hives and bees. Upon making inquiries, I learned the queen was sent from a diseased apiary, if not from a diseased stock.

My bee-keeping had taught me one good lesson, which I should be rejoiced if I could teach every labourer in the kingdom, i.e., "bee-keeping is money-making;" so that I was not happy without the cheery hum of these industrious labourers in my little garden; and when I again got together a small apiary I also obtained a stock of *Alp* bees. My experience with these I am now about to lay before our readers.

1st. The most important point connected with them is, are they able to gather more honey than our common black bees? If not, why make any change? I think I can make it plain; at least, not a doubt rests upon my mind that they do glean far heavier stores than the black species. I was struck, when observing the *Italian* bees side by side with the black bees at the London Exhibition of 1872. When it was raining rather heavily on one occasion, the *Ligurians* were working as briskly as possible, whilst not a solitary black bee made its appearance. Not satisfied with this single day's observation, I went again on two other occasions, on damp, cloudy days. Very few of the black bees were working; on the other side, my newly-made friends were quite brisk, as if inclined to make the beautiful poem by Dr. Watts fallacious, for they improved the dark, dismal days, or hours equally well, as the shining "hours." After careful watching since this time, I have fully proved this willingness to work; they seem, if I may be allowed to use the expression which seems scarcely applicable to bees to be fidgetty and and full of energy, always on the move; even on the alighting-board they are continually moving about. Doubtless, there are black bees quite as energetic as the pure *ligurian* stocks, for I observe much difference in this respect. Now, if this is a faithful representation, they must naturally gather considerably more honey during the season than their darker-coloured sisters. You observe two tradesmen in the same line of business. One is a pushing, go-a-head man, ever scheming how to extend his connection, somewhat like the late wonderful London draper; the other is a quiet, though industrious man. You may go to his shop, if you like, and he will gratefully and courteously serve you well; but he puts forth no effort to attract fresh customers. Which at the year's end will have turned over the most money, and done the most business? What is true of the one case may also be made the rule in the other. Then, say I, if you can, procure the business-like *alp*-bees, and secure the largest possible yield of honey during the season. But stay; I wish to take you a step in advance of this, and state why I believe they are able to make the most of every hour.

Very careful experiments and observations have been made both in England and America, as to their collecting capabilities. Thus they are found capable of collecting from the red *Clover* blossoms, may be not the same quantity as can be gleaned from the white or Dutch *Clover* (*Trifolium repens*)—still if they frequent this *Clover* at all, it ought to be a feather in their cap, for the corolla is considerably longer in the red *Clover*, and the black bees generally pass it over for the booming bumble bees. When the honey harvest is beginning to be less in quantity, they are noticed to be notorious robbers; woe be to the confectioners in the immediate neighbourhood of the apiary: if they do not keep their doors and windows closed, they suffer much from their depredations. I discovered this in a most unpleasant manner, when I first commenced to keep them. It was a close, hot, sultry afternoon—one of those dull days generally followed by a thunderstorm—when a grocer, a little distance away, came running for me to proceed to his shop to hive a swarm of bees. I was dubious about its being a genuine swarm; but judge my astonishment to find many thousands of my fine *ligurians* buzzing lustily about his shop. We opened the doors wide as possible, and I endeavoured to drive them out; though I was sorry, we killed nearly as many as would fill a small cottage skep. Again, one of these yellow insects found its way through a small round hole in the village druggist's window, where was exhibited for show a cake of very refined wax, probably 4 lb. in weight. I may just explain, refined wax, although a very saleable article from its pure appearance, is not quite pure bees' wax; for it contains about a sixth of its weight of olive oil; thus

it is slightly softer. Well, the bee carried a minute particle away on its thighs to the hive, and then brought several companions on his next journey to the window. In a few days they carried the prize completely away, without leaving an ounce, thinking, perhaps, it was the best policy, for we all know dead men tell no tales. However, to make my story short, when the chemist wanted his wax for some tidy housemaid to polish the old oak chairs, &c., it could not be found; of course he declared he put it there to exhibit the fact that his excellent stock was first-class—in fact, the best in the trade. It was some time before he discovered the real delinquents—not until a small jar of Narbonne honey had also well nigh disappeared, to be treasured up in the cells of the same hive of Ligurians. If they are unable to glean a sufficient harvest from one source, they, from their incessant activity, are not long in discovering the needful supply. Thus a strong stock of Alp bees are much more valuable as honey collectors than the black bees. I hope in other ways to prove their superiority upon returning to the subject in another article. R.

Reports of Societies.

Royal Horticultural: Aug. 21.—J. Colebrooke, Esq., in the chair. Mr. Andrew Murray announced the awards made by the committees, and made a few running comments on various subjects exhibited. The Santung Cabbage, brought up from the Society's garden at Chiswick, was specially noticed as a plant which had been first introduced from China by Mr. Fortune, but which did not grow well in this country. Mr. Barron had, however, succeeded in persuading it to make a good growth this season. Like the ordinary Cabbage of China, the Santung had no heart, but it was considered a great delicacy by the Chinese, and the best way of cooking it was to boil the leaves, strain them, and serve up with butter on toast. With reference to the varieties of *Abies Engelmanni* shown by Mr. Anthony Waterer and Messrs. Barron & Son, Mr. Murray stated that he believed they were all the same, but it was a difficult question to solve, and it was intended to submit portions of each to Professor McNab, of Dublin, for examination as the position of the resin channels, a characteristic in Conifers which he had made a special study of.

FLORAL COMMITTEE.—George F. Wilson in the chair. First-class certificates were awarded to day to Messrs. Veitch & Sons for *Begonia Queen of the Whites*, a broad, smooth, and pure white flower, thrown well up above the foliage, a welcome addition to the list of these attractive plants, and for *Oncidium pratense*, a free flowering new species, in which the sepals and petals are brown marked with yellow, and the labellum yellow margined with brown. To Mr. John Fraser, Lea Bridge, for *Ixora formosa*, a garden hybrid with nice trusses of Indian yellow coloured blossoms. To Mr. B. S. Williams for Phaius Dodgsoni, a fine new East Indian addition to the genus, with terminal spikes of pure white flowers, the upper surfaces of the lips of which are of a pale cinnamon-red shade of colour. To Mr. Green, gr. to Sir George Macleay, Pendell Court, Bletchingley, for *Streptocarpus Greenii*, var. *delicata*, white faintly shaded with blue, a pale-coloured variety of *x S. Greenii*, which is a hybrid between *S. Saundersii* and *S. Rexii*. To Messrs. Kelway & Son, Langport, for the following new varieties of *Gladioli*—*Cymbeline*, a fine, broad, and smooth rosy-pink flower with a white throat; *Prince George*, rich, deep vermilion-red, with dark crimson centre; the *Odalisque*, a very smooth white flower, marked with rosy-purple in a peculiar manner at the base of the petals; *Charles Noble*, scarlet, with a shaded white centre; and *Baroness Burdett Coutts*, a very pretty and distinct flower, pure white, and beautifully shot with purple on the lower petals. To Mr. Anthony Waterer, Knap Hill, Woking, for *Abies Menziesii Parryana*, a beautiful blue Spruce from Colorado, the identity of which has been under discussion in our columns. And to Messrs. E. & J. Perkins, of Leamington, for *Begonia Empress of India*, a magnificent new form, with large and very fine flowers of a deep blood red colour. Several fine new things were brought up from Chiswick, and the following were selected for awards of the 1st class:—*Double Zonal Pelargonium Litte*, deep rosy pink, deeper in colour than *Madame Thibaut*, but no improvement in other respects on that grand variety; *double Zonal Pelargonium Lafayette*, rosy carmine, and a fine bold trusser—both of these were raised by M. Lemoine, of Nancy; *Abutilon Lemoinei*, a free-growing and free-flowering plant, the blossoms of which are of fine size, and yellow in colour, a decorative plant well worth looking after; and *Torrenia Fournieri*, not so neat a grower as the better known *T. asiatica*, but more pronounced in colour, and with a very distinct

yellow blotch on the lower segment of the flower. A Second Class Certificate was awarded to Mr. Green for *Cœlogyne corrugata*, a small white-flowered species, with a yellow-blotched lip. To I. Anderson-Henry, Esq., a Botanical Commendation was voted for a species of *Primula* from the Sikkim Himalayas, in which the leaves are small and sharply serrated, and the powdered flowers of an ultramarine blue shade of colour. In addition to the subjects before mentioned, Messrs. James Veitch & Sons showed a nice group of flowering plants, principally Orchids, and received a vote of thanks. Mr. B. S. Williams was also similarly treated with regard to a very fine specimen of *Ixora Williamsii*, in flower for the third time this season. Mr. Tong, gr. to J. S. Law, Esq., South Lodge, Southgate, sent a batch of dwarf, neat-habited, and free-flowering *Begonias*, of the type now becoming popular for bedding-out. Messrs. Kelway & Son received a vote of thanks for a handsome display of *Gladioli*. Mr. Cannell, of Swanley, sent two dozen bunches of cut blooms of the beautiful double pink *Zonal Pelargonium Madame Thibaut*, and also flowering plants of a good blue bedding *Lobelia*, named *Brighton*, grown under various conditions; and Mr. Parker, of Tooting, exhibited some cut flower sprays of the double pink-flowered variety of *Rubus fruticosus*, a plant but little known, but one of the most beautiful subjects in existence for planting against a pillar, and one that will thrive well where a pillar Rose would scarcely grow. Messrs. Barron & Son, Elvaston Nurseries, also showed a green and glaucous form of *Abies Engelmanni*, which is believed to be the same as the one shown by Mr. Waterer under the name of *A. Menziesii Parryana*.

The subject of the forthcoming provincial show at Preston was discussed by the committee, and the following resolutions were passed, and ordered to be sent up to the Council:—Proposed by Mr. J. Fraser, and seconded by Mr. J. Wills—"1. That this committee fear the interests of the Royal Horticultural Society and of horticulture generally will suffer unless a schedule of the proposed provincial show be issued as soon as possible." Proposed by Mr. T. Baines, and seconded by Mr. G. Baker—"2. That this committee wish to urge upon the Council the extreme importance of issuing this schedule at once, as any further delay will unquestionably be detrimental to the display, the want of this information being exceedingly embarrassing to intending exhibitors, as it prevents their preparing their exhibits so as to have them in good order for the occasion.—Signed on behalf of the committee, George F. Wilson, Chairman.

FRUIT COMMITTEE.—H. Webb, Esq., in the chair. To Mr. Tillery, Welbeck, a Cultural Commendation was awarded for a fine dish of *Victoria Nectarines*, the fruits being of fine size and unexceptionable quality. Mr. Morse, gr. to W. P. Baker, Esq., Bromwell House, Burlington, Bristol, showed a white seedling Grape, the result of a cross between *Black Hamburg* and the *Muscat of Alexandria*, but the committee did not think favourably of it as shown. Messrs. Kelway & Son showed examples of two Cucumbers under the names of *Lord Beaconsfield* and *Prince of Wales*, the former being a good form of *Telegraph*, and the latter too much like *Daniel's Duke of Edinburgh* to secure an award. A scarlet fleshed seedling *Melon* came from Mr. Tong, gr. to J. S. Law, Esq.; and a green-fleshed fruit named *Incomparable* came from Mr. Burnett, gr. The *Deeptide*, but both proved to be in poor condition. Are *Melons* generally doing bad this year? They are a bad lot that are sent here generally. Under the name of the *Stone Apple*, a large, solid, and evidently very good variety, though not yet ripe, was shown by Mr. Louis Killick, Langley, Maidstone; and specimens of the *Santung Cabbage*, distinct, but a curiosity, and something like what one would expect from a cross between the *Cabbage*, *Turnip*, and *Cos Lettuce*. *Madeleine Royal* and *Royal Muscadine Grapes* also came from Chiswick.

West Wycombe Horticultural.—The sixth annual show of this Society was held in West Wycombe Park, lent for the purpose by Lady Dashwood, the patroness of the Society. The show was first established in 1871 for the encouragement of cottage gardening in this extensive parish, and, from a small beginning, has annually increased in usefulness and importance. Lady Dashwood has taken great interest in the Society from the commencement, both by an annual subscription, and by throwing open her beautiful park on the occasion of the annual show. The business of the show is conducted by a committee consisting of twenty-four working men, a certain number being chosen to represent each district of the parish at the annual meeting in April, subscriptions for members being 1s. each annually, entitling the subscriber to exhibit, and to a free ticket for himself, wife, and the members of his family under fifteen years of age. There were upwards of 600 entries for the present show, 206 being for

Potatoes, and nearly 2000 persons passed the gates during the day. The amount annually distributed in prizes is upwards of £20. The formation of the Society has been the means of energising the latent horticultural element which existed in an almost dormant state in the parish, as, since its establishment, a rapid course of advancement has been manifest, both with regard to the number of exhibitors and the quality of their productions, and as a show of this class it will now bear a favourable comparison with any of the kind in existence. To induce an interest in the proper cultivation of cottage gardens and allotments liberal prizes are offered, and the competition in this way is such as justifies much commendation. Another class, which also deserves every meed of praise, is that for the encouragement and cultivation of taste among the children in the way of nosegays of wild flowers; by reason of the surrounding district being somewhat fertile in this respect, some very beautiful bouquets are produced which help to render the show very attractive. Vegetables, which are the most important feature at a show of this description, were all that could be desired, embracing splendid dishes of Potatoes, Onions, Carrots, Turnips, French Beans, and Scarlet Runners. Fruit, although somewhat sparsely shown, comprised excellent Apples, Gooseberries, Currants, and Raspberries. *Observer.*

Shepton-Mallet Horticultural: Aug. 14.—Although the flower-shows of our provincial towns have much in common and possess sameness of features almost wearisome to those whose duties take them to many in the course of the year, yet there are here and there found features that command attention and interest even for the professional *habitué*, whilst locally they are viewed with the most intense excitement and approbation. Shepton-Mallet has one feature peculiarly its own, for the annual flower-show is specially the *lête* day of the town and surrounding country, and from all parts the residential population flock in by thousands to visit the *lête*, of which, if the flower show is but one element of attraction, it is certainly the element around which all other minor attractions centre. Formerly one of the most popular shows of the West, it for various reasons suddenly collapsed, to be again last year revived, and this year to be continued with renewed vigour. Held on Tuesday the 14th inst., in a small but nicely timbered field adjoining the town, and in weather of the most delightful kind, the show was found to possess many features in advance over those of last year, a result that naturally afforded its plucky revivers many reasons for congratulation. But the phrase "plucky Sheptoners" is a well-understood one in the district, for where is there found the other provincial town that on the occasion of its flower-show promotes a town decoration. The Committee raises a large sum of money for its disbursement, which is expended in the erection at each entrance of the four principal streets that intersect Shepton of an evergreen Gothic arch; plants at intervals all through these streets Venetian masts, from which small flags are pendent, and also are hung from mast to mast festoons of evergreens; also between each mast are set into the sides of the streets tall heads of Spruce Fir, that look for the time as fresh as though growing on roots of Nature's provision. Many of the shop windows, and those of private houses, have their own special floral displays. A fair is held just outside the town; a town band is also engaged, and the Flower Show Committee put the climax on the local pluck by engaging from London, at a large cost, the splendid band of the Coldstream Guards, in order that the myriads of visitors may have added to the solid *ditto* of the show the sweets of the choicest of instrumental music. To those in search of a little novelty, the Shepton flower show presents attractions well worthy of their attention. The show itself is held in a series of marquees, most of them wisely devoid of sides, in which are placed the respective open, amateur, and cottager classes, most of the exhibits being of good quality, the cottagers' especially presenting a most meritorious display. The open classes were made up of stove and greenhouse plants, Ferns, foliage plants, *Fuchsias*, *Begonias*, &c., of the ordinary type, the two best collections being the stove and greenhouse plants, and *Fuchsias* staged by Mr. Mould, of Pewsey, who is rapidly becoming a valuable supporter to the west country shows. Mr. Mould's *Fuchsias*, although not up to the Trowbridge mark, are yet fine, well-grown examples of this delightful decorative plant. Perhaps to visitors generally the cut flowers were most attractive. In the class for twenty-four *Dahlias*, Mr. J. Keynes, of Salisbury, was placed 1st with a collection of even and remarkably neat flowers, the most noticeable being *Harriet Tetterel*, deep violet-magenta; *James Cocker*, deep purplish crimson; *Dauntless*, bright orange red; *John Macpherson*, rosy purple; and *John Neville Keynes*, bright straw yellow. A very plucky amateur, in the person of Mr. J. Dobree, of Wellington, Somerset, was placed 2d to Mr. Keynes with a collection of blooms, such as is now too seldom seen out of a nurseryman's ground. In the class for twelve *fancies*, Mr. Keynes was again 1st, and Mr.

Dobree 2d. Roses were well shown by Messrs. Corp, of Oxford, and Keynes, Mr. Corp being put 1st with twenty-four threes, in which were capital examples of those favoured new Roses, (Marguerite Brassac and Mons. E. Y. Teas, also Louis Van Houitte, Marie Rady, Devienne Lanoy, and Marie Finger; Mr. J. Keynes was 2d, having in his boxes good blooms of the ever-fresh Alfred Colomb, Docteur Andry, Reynolds Hole, and François Michelin. In the class for twelve single blooms, Mr. Keynes was 1st and Mr. Corp 2d. Very good Asters, Hollyhocks, Gladioli, &c., were shown, but the Messrs. Kelway, in staging one of their fine collections of thirty-six spikes, naturally surpassed locally-grown Gladioli, although not staged for competition. The front row consisted of seedling flowers not before exhibited, several of great size and beauty, and of these the following were awarded Certificates of Merit:—Petrarch, a very even, compact spike; flowers large in colour, rich pink, flaked with bright carmine. Lord Shaftesbury, white ground, flushed rose, and flaked at the edge of the petals with deep purplish rose, a very taking flower. Hobart Pacha, a fine spike, the flowers in colour rich, rosy carmine. Shirley Hibberd, white ground, flushed with rose, and flaked with deep rosy carmine, a grand show variety. Richard Dean, a superb spike, the flowers in colour bright rosy vermilion; a very effective kind and Galopin, clear paper-white ground, rosy purple tip, the upper petals flaked with purple. The Messrs. Kelway also exhibited cut blooms and leaves of Hyacinthus candican, cut from a large batch of seedling plants, showing it to be a very fine border plant. It was worthy of notice that in the class for Begonias, small well-flowered plants, shown by Mr. James Allen, of Shepton, were awarded the 1st prize in preference to large-foliage varieties.

Amongst the cottagers' productions, the Potatoes in the West of England invariably prove worthy of special attention. Thus in the class for half a peck of Rounds, a very handsome kind named Radstock Beauty was placed 1st, and a very nice dish of Climax 2d. In Kidneys, Ashleaf was 1st, and Lady Paget, a locally-named Lapstone, sometimes spelt "Padgett," was put 2d. Other curious names are found in Crack Waggon and Hard Cash, both white Kidneys. Scammell's Glory, Red Emperor, Red Breadfruit, and Bonafal were remarkably clean and handsome.

Notices of Books.

Popular British Fungi: Illustrated. By James Britten, F.L.S. *Bazaar Office.*

This work contains popular "descriptions and histories of the principal fungi, both edible and poisonous, of our country," and is, as its name indicates, a gossiping book on Mushrooms and Toadstools, the quotations ranging from Pickwick to Berkeley. As far as our examination has gone, the more scientific portion of the work is singularly correct; this, indeed, was to be expected, from the experience Mr. Britten has had as a writer and the opportunities he has had for exact work in his position in the Department of Botany at the British Museum. The work under review, therefore, contrasts favourably with some other popular works and essays on fungi, and should take a foremost place amongst popular handbooks. A very valuable part of Mr. Britten's work is its chapters on the folklore, popular beliefs, and superstitions regarding fungi. Its recipes for cooking, &c., gathered from all reliable sources, make the book one of the most complete of its class. It is illustrated with a series of woodcuts, not well drawn, and mostly copied from Mr. Worthington Smith's drawings in the British Museum; had these illustrative reproductions been as accurate as the letterpress, the work would have been far more valuable. We observe, too, that (with one or two exceptions) no sections are given with these cuts; this must be looked upon as an oversight, for even in the field it is often almost impossible to name fungi without cutting them longitudinally to display the attachment of the gills to the stem. A few of the cuts are copied from Dr. Cooke's *Plain and*

Easy Account of British Fungi. These are not satisfactory, and the copy of *Boletus edulis*, on p. 61, though sufficiently like the original lithograph, is quite unlike Nature. *Boletus edulis* is one of the most substantial, bulky, and thick-stemmed of all Boleti, and not a comparatively thin-stemmed plant like the illustration, in which, too, the characteristic meshings of the stem are omitted, or not properly shown.

Under *Agaricus personatus* Mr. Britten questions Dr. Badham's accuracy in explaining the popular name of this fungus—viz., "Blewit"—as being derived from "Blue-hat;" but when our author remembers that the same fungus is known in the Midland Counties as the "Blue-bonnet," we think he will acknowledge that Dr. Badham was probably right in his surmise. Besides, Mr. Britten himself says, on p. 31, that "caps" is a common name in the eastern counties for all kinds of fungi. The blue colour on the stem of this fungus is of very little specific value, as it is often absent, and a large number of species found under Cortinariis constantly have the upper part of the stem blue in colour. In a future edition it may be as well to add, under *Agaricus muscarius* and its use in medicine, that there is a homeopathic preparation of this plant made for the cure of corns, and sold in chemists' shops in London. Several paragraphs in Mr. Britten's book have certainly taken us by surprise, such as the statement that the intensely acrid and dangerous *Lactarius piperatus* is "a favourite food of hares and rabbits." As far as our experience goes, no animals (as a rule) except snails, take acrid fungi as food, for whilst Mushrooms and mild fungi are eagerly devoured by rabbits, squirrels, and birds, the acrid species are generally found intact. The twin brother of *L. piperatus* (and the next species in the hand-books) is *L. vellereus*, and Berkeley tells us that "dogs snuff dreadfully" if they only bite this plant. The acrid milk is the same in both, and it seems at first sight a little strange (if true) that the favourite food of the hare should be such a deadly poison to the dog. Again, *Russula lepida* is said to change "in cooking to a bright green," and in this instance the change of colour "is an evidence of the good character of the fungi under treatment."

We look upon *R. lepida* as a somewhat rare fungus, and we have not tested its edible qualities; but the next time we meet with it we will not fail to test its value for the table, and observe the change of colour (if any) at the same time. Under *Chantarelle* Mr. Britten says most writers state the odour of the fungus to resemble Apricots, though our author has "not been able to detect the resemblance." The explanation of this is, there are two distinct varieties of the Chantarelle, one with an insipid odour and almost useless for the table, the other powerfully perfumed with an odour of Apricots, which it retains even after cooking, and so makes a most delicious dish. Speaking of the Giant Morel, *Morchella crassipes*, Mr. Britten says it has at present "only been found in the South of Devonshire, but is likely enough to turn up elsewhere." This species has of late years been repeatedly exhibited at the meetings of the Royal Horticultural Society and by the Woolhope Club from localities all over the country. It has also been found in Kew Gardens, and always grew in the late Mr. Smees' garden at Hackbridge. Mr. Smees has illustrated it in his *My Garden*. We have observed a few unimportant misprints, which can easily be set right in a future edition; but the book, taken as a whole, abounds with reliable information and gossip about fungi that must have cost the author much time and great pains to place together in the readable form in which he has presented it to the public.

Flora of Mauritius and the Seychelles, &c.

By J. G. Baker, F.L.S. (Reeve & Co.)

This forms one of the series of *Colonial Floras* originally projected by the late Sir W. Hooker, and elaborated at Kew. Of these floras those of Hong Kong, New Zealand, the West Indies and the Mauritius, are now completed. Six volumes of the *Flora Australiensis*, a monument to the zeal of Baron Mueller, and to the clear sagacity and unwearied industry of Mr. Bentham, are also completed—the seventh and last volume, we believe, being almost ready for issue. Two volumes of the *Flora of Tropical Africa* have been published, and a third is nearly ready on the same plan as the *Colonial Floras*, and one volume of the *Flora of British India* has been elaborated, and a second is in a fair way towards completion. We have always thought it an unfor-

tunate circumstance that these works were not drawn up, at least so far as the diagnostic characters are concerned, in the Latin tongue as used by botanists all over the world. By far the great majority of English readers who would seek information from them would have no difficulty in interpreting the dead language, which is, moreover, on all hands admittedly to be more convenient for precise and concise scientific descriptions than our own. On the other hand, foreign botanists would not experience the difficulty they do in pursuing their investigations. We believe the *Colonial Floras* have not attained that scientific repute on the Continent which their merits justify, solely for the reasons mentioned. It may be said that the floras in question are intended specially for English readers; but, in any case, we suspect a very large proportion, if not an absolute majority, of those who require to use these volumes are foreigners, and to most of those Englishmen who require to use the books, the Latin would be no hindrance. However, it is too late in the day to alter this now. Next to the invaluable *Genera Plantarum*, this series of books is the most useful that has emanated from Kew, or from what we may designate as the Kew School of Botanists, and proud may well be the authorities of that establishment at the work already done. Those only who have had a share in similar undertakings can properly estimate the time and labour involved in the preparation of these volumes, so that while we impatiently await the completion of the genera, and earnestly desire the more rapid progress of the floras of British India and of the Cape, we can but admire the evidences of skill and industry of which the already published volumes furnish such remarkable examples. May we add here an additional reason why we and others would rejoice to see the completion of the *Colonial Floras*? The colonies, no doubt, have their requirements, and it is right that they should be met, both from the point of view of pure science and economic botany. But we at home have our requirements too, and among these is the preparation of a new *Hortus Kewensis*. An authoritative catalogue of all cultivated plants with synonyms and references is becoming every day a more urgent want. In no place could such a catalogue be drawn up so well, or with such facility, as at Kew, and while we earnestly desire the completion of the *Colonial Floras*, we do but echo the feeling of all horticulturists in urging the speedy publication of a new *Hortus Kewensis*.

Mr. Baker's latest contribution to botany embraces the botanical census of Mauritius, the Seychelles, and Rodriguez. It is almost a pity that Bourbon was also not included, but probably the materials were not at hand in sufficient abundance. Moreover, our French friends might more appropriately undertake this task for their own colony. In an introductory chapter Mr. Baker gives a brief sketch of the physical geography of Mauritius, a tropical island about the size of the county of Surrey, but with mountains rising nearly to 3000 feet. So much is the island cultivated, that its original Flora is very materially abolished, and the ground, where not cultivated, occupied by foreign intruders, whose presence does not give a stamp of individuality to the island-flora, seeing that they are for the most part tropical plants of very wide diffusion between tropical limits. The existing Flora is, therefore, a singularly mixed one, and owing to this admixture, and to the abolition of the aboriginal flora, speculations as to the history of the flora to the past and its relationship to the flora of Africa, Madagascar, India, &c., are rendered but little trustworthy or altogether vain. The Seychelles have hitherto been far less known; they have a more distinctly tropical character, and yield several Pandani and Palms, which are now no strangers to our gardens; amongst them the so-called Thief Palm, *Phœnicophorium*, more appropriately called *Stemsonia grandifolia*, and *Verschaffeltia splendida*. Rodriguez, which was visited by Dr. Bailey Balfour, has been robbed of most of its botanical treasures by unsympathetic goats; but no less than thirty-six wild plants out of some 200 collected by Dr. Balfour are peculiar to the island, and among them three representatives of new genera. Of the total number of species known to be endemic, viz. 304, 22 per cent. are of Mascarene type, 6 per cent. African, 8 Asian, 14 common to Asia and Africa, and 21 common to the Old and New Worlds. The nine largest orders are Ferns, which comprise 168 species, Orchids, 79; grasses, 69; Cyperaceæ, 62; Rubiaceæ, 67; Euphor-

biacæ, 45; Compositæ, 43; Leguminosæ, 41; and Myrtaceæ, 20. The total number of wild plants mentioned being 1058, belonging to 110 natural orders and 440 genera, so that the proportion of species to a genus in this flora is between two and three, and of species to an order between nine and ten. Of the manner in which the flora has been drawn up nothing but practical experience in the future can give an absolute test, but Mr. Baker's great experience, his name and repute, are ample guarantees that this volume will take equal rank with those of the series that have been already published. In the elaboration of the Orchids, Mr. Baker has had the assistance of Mr. S. Le Marchant Moore, and for that of the Palms and Pandani of Dr. Bailey Balfour, who made a special study of these difficult plants in Rodriguez.

Aug. 16.—A fine bright warm day. Partly cloudy.
 17.—A fine warm day. Cloudy at times. Cloudless at night.
 18.—A fine bright day. Very cloudy, with slight shower of rain at 3 P.M.
 19.—Fine warm day, generally cloudy. Few drops of rain at times. Lunar rainbow in evening.
 20.—A very fine hot day. Partly cloudy. Smart shower of rain at 4 P.M.
 21.—A fine day, cloudy and showery at times. Strong wind.
 22.—A fine bright day. Very heavy rain at 2 A.M., and a shower fell in the afternoon. Cloudless at night.

LONDON: Barometer.—During the week ending Saturday, August 18, in the suburbs of London the reading of the barometer at the level of the sea increased from 30.07 inches at the beginning of the week to 30.08 inches by the morning of the 12th, decreased to 29.79 inches by the afternoon of the 14th, increased to 29.97 inches by the morning of the 16th, decreased to 29.92 inches by the evening of the same day, increased to 30.07 inches by the morning of the 18th, and decreased to 29.95 inches by the end of the week. The mean reading for the week at sea level was 29.95 inches, being 0.13 inch above that of the preceding week, and 0.02 inch below the average.

Temperature.—The highest temperatures of the air observed by day varied from 80° on the 14th, to 70½° on the 13th; the mean value for the week was 75°. The lowest temperatures of the air observed by night ranged from 51½° on the 12th to 59½° on the 14th; the mean for the week was 57°. The mean daily range of temperature in the week was 18°, the greatest range in the day was 20½° on the 14th, and the least 12½° on the 13th.

The mean daily temperatures of the air, and the

departures from their respective averages, were as follows:—12th, 59° 8', -2°.4; 13th, 61° 9', -0°.3; 14th, 67° 6', +5° 6'; 15th, 64° 0', +2°.3; 16th, 63° 9', +4°.5; 17th, 63° 0', +1°.8; 18th, 63° 0', +2°.0. The mean temperature of the air for the week was 64° 6', being 1° 9' above the average of sixty years' observations.

The highest readings of a thermometer with blackened bulb in vacuo, placed in sun's rays, were 140° on the 17th, 137½° on the 16th, 133° on the 14th, and 132° on the 15th. The lowest readings of a thermometer on grass, with its bulb exposed to the sky, were 40½° on the 12th and 42½° on the 18th; on the 13th the reading did not descend below 56°. The mean of the seven low readings was 48°.

Wind.—The direction of the wind was variable, and gentle in motion.

Weather.—The weather during the week was fine and dry, and the sky partially cloudy. Lightning was seen on the nights of the 14th and 15th.

Rain.—A few showers of rain fell on Wednesday afternoon, the 15th, but the amount was only 0.02 inch.

ENGLAND: Temperature.—The highest temperatures of the air observed by day were 80° at Blackheath, 78½° at Cambridge, 76½° at Bristol, and 76½° at Nottingham; at Portsmouth and Liverpool 70½° was the highest temperature, the mean value from all stations was 74½°. The lowest temperatures of the air observed by night were 41° at Truro, 45½° at Bristol, and 46½° at Wolverhampton; at Portsmouth 55½° was the lowest temperature, and at Hull 55°; the general mean from all stations was 50½°. The range of temperature in the week was the greatest at Truro 33°, and the least at Portsmouth 15½°; the mean range from all stations was 23½°.

The mean of the seven high day temperatures was the highest at Blackheath 75°, Cambridge 74½°, and Bristol 74°; and the lowest at Sunderland, 63½°. The mean value from all stations was 70½°. The mean of the seven low night temperatures was the lowest at Truro, 51½°, and at Wolverhampton and Eccles both 52½°; and the highest at Portsmouth, 58°; the mean from all stations was 55°. The mean daily range of temperature in the week was the greatest at Truro, 21°, and the least at Sunderland, 7½°; the mean daily range from all stations was 15½°.

The mean temperature of the air for the week from all stations was 61°, being 7° lower than the value for the corresponding week in 1876. The highest was 63½° at Blackheath, and the lowest 58½° at Wolverhampton.

Rain fell on six days at Cambridge and Sheffield, and on four days at most other places. The amounts collected varied from 1 inch and four-tenths at Truro and Cambridge, to two-hundredths of an inch at Blackheath. At Brighton and Portsmouth no rain fell; the average fall over the country was half an inch.

The weather during the week was generally fine, though the sky was cloudy. Thunderstorms occurred during the week at various places, but were felt most severely in the midland counties.

SCOTLAND: Temperature.—The highest temperatures of the air observed by day varied from 73° at Greenock and Perth to 66½° at Aberdeen; the mean value from all stations was 70½°. The lowest temperatures of the air observed by night ranged from 46° at Dundee to 52½° at Glasgow; the mean from all stations was 49½°. The mean range of temperature from all stations was 21°.

The mean temperature of the air for the week from all stations was 58½°, being 5° lower than the value for the corresponding week in 1876. The highest was 61°, at Greenock, and the lowest, 56½°, at both Edinburgh and Leith.

Rain.—The amounts of rain measured during the week varied from 2 inches at Edinburgh and Greenock, 1½ inch at Dundee, and 1½ inch at Leith, to three-quarters of an inch at Glasgow and Aberdeen; the average fall over the country was 1 inch and four-tenths.

DUBLIN.—The highest temperature of the air was 73°, the lowest 45°, the range 28°, the mean 62°, and the fall of rain rather more than 1½ inch.

JAMES GLAISHER.

Variorum.

A FRENCH GARDEN.—It was not what our French friends call *un jardin bébé*, but something much more delightful, namely, a garden without design or plan, and, except for abundant watering, left much to itself; a dozen pleasure grounds in one, indeed, with bits of vegetable garden and orchard running into the parterres, delightful little corners, all turf and shadow, woods in miniature, green walks shaded by Cherry trees laden with lustrous fruit, trellised Vines, reminding me of Italy; a tiny rivulet overgrown with Loosestrife and Willow-herb, glimpses of yellow cornfields through all, and flowers in inde-

scribable, royal, distracting abundance everywhere. Would I could describe them, but a chapter, nay, a volume, would not do it. Take, for instance, the Pinks and Carnations, or *aillet*, introduced into France by the good King René. What do we in England know of this glorious flower?—Here rivaling the Rose both in splendour and perfume. Then take the Larkspur, a poor creature of a flower with us, banished long ago from rich people's gardens; but what a beautiful flower is the Larkspur when seen in perfection!—graceful, nay, stately, with glorious minarets of delicate blossoms in white, pink, lavender, and deep purple; in fact, a bed of Larkspurs is a garden in itself if properly cultivated. Then there is a countless variety of the familiar Dragon's-mouth, or Antirrhinum, brilliant gold and ruby colours predominating, but others in plenty; the bright rose-pink and pure white *Belle de Nuit*, known to us as Marvel of Peru, and to our American friends as Four-o'clock; and Roses in great splendour and abundance. In my friend's garden are hardly any but these old-fashioned flowers; a large variety of Sweet Williams, in French *aillet de Poite*; Roses, of course; and by no means least, if last mentioned, the exquisitely graceful and poetic Cornflower, or *bleuet*, here cherished as a garden flower, but only known in England by one variety, that bluest of the blue, *Centaura cyanea*. Here we have Cornflowers, white, purple, rose-coloured, or white with just a tinge of shell-like pink, violet or orange. It is the poet's and the children's flower in France, and you find no garden without it." From "A Year in Western France," by M. Betham-Edwards.

Enquiries.

He that questioneth much shall learn much.—BACON.

202. WASPS' NESTS.—I think I have seen some years ago advertisements of cartridges for smoking out wasps' nests, rats, vermin, &c., something like the stinking-pots of the Chinese. Can any of your readers tell me where to get them, and at what price they are sold? *Jeau van Volxem*.

Answers to Correspondents.

APPLE TREES KILLED: *H. Beasley*. Undoubtedly the gas tar was the cause of their death. It should have been mixed with cowdung before being applied to the tree stems.

ASH LEAVES. The brown spots cannot be distinguished from *Ecotostroma Liriodendii*, to which the same remark applies as to *E. herbarum*. Nothing is more common than a similar affection on lime trees. No one, however, has been able either to ascertain the cause, or to find any trace of fungi. *M. J. B.*

BOOKS: *G. B. The Amateur's Greenhouse* (Groombridge.—S. O. *Olliver's Elementary Lessons in Botany* (Macmillan & Co.)

BUTCHER'S BROOM: *Erratum*. Please allow me to correct two errors in my note on the "Butcher's Broom," at p. 214, "Kelen," not "Kelm," is Celtic for Holly; and it should be the "eclogues and Georgics."

CHRYSANTHEMUMS: *J. H. M.* Seeds must be saved under glass in moderate heat. The Channel Islands have furnished much of the seed from which new kinds have been obtained.

COLEUS: *J. H. M.* These fine varieties of *Coleus* owing cultivation are hybrids and garden mules, which have sported infinitely.

CUCUMBER TUBES: *J. Carter & Co.* We do not see any advantage whatever in the metal tube, of which you send an example. It is in our opinion neither so efficient nor so readily made as one of wood, with a loose cover or slip of glass. The fruit was far from being a handsome specimen.

FUNGUS: *G. S.* There is nothing uncommon in the little abnormal *Agaricus* with long stems growing under your tub. The abnormal growth is produced by the uncomfortable position of the fungi.

GARDEN LOUNGE: *A. H. T. G.* They are manufactured by E. Salmon & Co., Steam Cabinet Works, Great Malvern.

HOLLYHOCKS: *Camje*. The two leaves are differently affected, the one with pale spots has been attacked by red spider, the other with brown spots has *Ecotostroma herbarum*, if that is a fungus, and, if so, in an undeveloped state. *M. J. B.*

LILIES: Mr. Elwes recommends the following as not requiring special culture:—

<i>Hardy Lilies.</i>	<i>Lilium longiflorum</i>
<i>Lilium martagon dalmaticum</i>	" <i>superbum pyramidale</i>
" <i>Szovitsianum</i>	" <i>croceum umbellatum</i>
" <i>Chalcedonicum</i>	
" <i>californicum</i>	<i>For Greenhouse.</i>
" <i>tigrinum splendens</i>	<i>Lilium nigerrimense</i>
" <i>elegans albaeum</i>	" <i>longiflorum eximium</i>
" var. <i>incomparabile</i>	" <i>auratum</i>
" var. <i>venustum</i>	" <i>speciosum in variety</i>
" <i>candidum</i>	

INSECTS: *E. T.* Your Yew trees are being eaten by the larva of one of the Geometridæ, but we do not know the species, nor a remedy.—*J. Rogers*. *Orchesella cincta*; no doubt brought in with the leaf-mould, and easier to bring in than turn out.—*R. S. N.* They are not eggs, but pupæ, apparently of a fly, but unknown to A. M.—*R. Lowe*. 1, Leaf-cutter bee; 2, eggs and arvæ of some moth; we cannot say what.

INSECTS IN A VINERY: W. R. The insect is the mealy-bug, *Coccus Aonidiu*—a too well known pest. You can do nothing until the Vines are at rest, but rub off as much as you can with your fingers or with a brush, and persevere in so doing. After you have pruned the Vines dress them with Gishurst compound, and thoroughly cleanse all the woodwork of the house, as well as any other plants that may be grown in it.

MFLON: Dickson. Scarlet Gem, we believe.

NAMES OF PLANTS: H. M. E. *Sedum ochroleucum*, better known as *S. altissimum*.—*E. G.* 1, *Pinus laricio*; 2, *Picea Pindrow*; 3, 4, 5, *Abies Smithiana*; 6, *Polygonum cuspidatum*.—*Subscriber*, 1, *Veronica Lindleyana*; 2, *Hybrid veronica*; 3, *Anemone japonica*; 4, *Adiantum athiopicum*; 5, a *Selaginella*, not to be determined from such a scrap.—*R. C.* *Cytisus Laburum*, var. *alpinus*, commonly called the Scotch Laburum.—*G. Palmer*, 1, *Epidendrum cinnabarium*; 2, *E. elongatum*.—*James McDonald*, *Veratrum nigrum*.—*H. King*, *Erica stricta*.—*F. H. M.* *Saxifraga sarmatosa*.—*F. H.* *Gesnera oblongata* and *Asplenium ebeneum* (apparently).—*Reader*. We do not recognise your plant by the foliage; it is apparently some Composite. Send it by-and-by, when it blooms.—*W. Rutley*, *Betonica officinalis*, *altis Stachys Betonica*.

PROLIFEROUS ROSE: J. T. Very common. The growth of the central part of the flower is continued instead of being checked, as it usually is.

• Correspondents are specially requested to address, post-paid, all communications intended for publication to the "Editors," and not to any member of the staff personally. The Editors would also be obliged by such communications being sent as early in the week as possible. Correspondents sending newspapers should be careful to mark the paragraphs they wish us to see. Letters relating to Advertisements, or to the supply of the Paper, should be addressed to the Publisher, and not to the Editors.

CATALOGUES RECEIVED.—Jules de Cock (Faubourg St. Lévin, Ghent, Belgium), Trade Catalogue of Ornamental Plants, &c.

COMMUNICATIONS RECEIVED.—C. B. & Co.—F. B.—J. P.—G. C. (many thanks; next week).—W. G. T.—R. M.—F. C.—J. J. H. G.—E. M.—J. R. L.—T. B. (thanks).—H. K.—J. K.—T. L.—An Old Subscriber. (We shall deal with the subject in our next issue).

DIED, on August 20, at Stamford Nursery, Bowdon, Cheshire, in his 22d year, **GEORGE CATHCART**, youngest son of John Shaw, landscape gardener. He was much and deservedly respected, and his loss will be long felt by a large circle of friends.

Markets.

COVENT GARDEN, August 23.

The market remains much about the same as last week, the supply of home produce being very short. *James Webber, Wholesale Apple Market.*

SEEDS.

LONDON: August 22.—Nothing of special interest has transpired on the Seed market during the present week, but there has been a steady trade doing in those kinds of seeds wanted for present sowing. No new samples of Mustard have yet appeared; yearling parcels continue to find buyers at full rates. For Rapeseed there has been a brisk inquiry at a rise of several shillings per qr.; in all the growing districts the complaint, with respect to the yield, is universal, the out-turn averaging from 20 to 30 per cent. less than was expected. In the value of Trifolium incarnatum there is no alteration. Winter Tares, being in abundant supply, are obtainable on moderate terms. Of Rye, the arrivals continue limited, and, consequently, good prices are realised. Feeding Linseed shows no variation. The yield of Blue Peas proves disappointing, so that for the few lots on offer rather high prices are asked. Canary seed, with a quiet sale, keeps steady in value; for Hemp there is a fair request at the late advance. In White Clover Seed there has been some business passing on slightly enhanced quotations. One or two samples of red Clover and of Trefoil, both of the new growth, have just come to hand from France; and the prospects of the English crops are not promising. *John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.*

CORN.

At Mark Lane on Monday the trade in Wheat was dull, and prices had a downward tendency. The Oat trade was dull, but Barley was scarce, and it was expected that malting produce would fetch high prices during the coming season. Beans and Peas were steady in value, but the flour trade was dull on rather easier terms. Foreign Wheat might be purchased at a reduction of 2s. per quarter from the rates of the previous Monday, but as regards new English Wheat quotations were not altogether fixed, 64s. per quarter being about the value of some of the best samples. Barley was slow of sale, with little variation in price. Malt was, perhaps, in rather better request. Oats were difficult to move, and Maize was comparatively firm.—On Wednesday trade was quiet, and prices remained much the same as on Monday. The small supply of new English Wheat was of rather variable quality, and the prices asked ranged from 58s. to 64s. per quarter. Foreign Wheat, of which the supplies were liberal, was difficult to sell, even at the late reduction. Barley and Maize were steady, while Oats continued beavy. The flour market was also heavy.

CATTLE.

At the Metropolitan Market, on Monday, there were a few more beasts than of the previous Monday, and the demand being good, prices rather improved. The number of sheep was about the same as last week, and trade was brisk at a small advance. There were but few lambs and calves on offer, equal, however, to the demand. Quotations:—Beasts, 5s. 10d. to 6s. 2d., and 5s. 8d. to 5s. 10d.; second quality beasts, 4s. 6d. to 5s. 2d.; calves, 5s. to 6s.; sheep, 6s. 10d. to 7s. 2d., and 6s. 6d. to 6s. 8d.; ewes and second quality, 5s. 6d. to 6s.; and lambs, 6s. 8d. to 7s. 8d.—On Thursday trade was quiet, but steady. Beasts in moderate supply. The demand was firm, and prices ruled rather higher than on Monday. Sheep were in short supply, and sold at about late rates. Lambs were quiet and unaltered. Calves sold on former terms.

HAY.

At Whitechapel on Tuesday the trade for fodder was dull, without variation in prices. Prime old Clover, 100s. to 135s.; inferior, 85s. to 95s.; good new Clover, 100s. to 126s.; prime meadow hay, 90s. to 120s.; inferior, 70s. to 85s.; good new hay, 80s. to 100s.; and straw, 44s. to 56s. per load.—On Thursday the supply of hay and straw was short. The trade was firm for best Clover, and prices were rather higher for best old Clover. Quotations:—Prime old Clover, 100s. to 137s.; inferior, 85s. to 95s.; good new, 100s. to 126s.; prime old meadow hay, 90s. to 120s.; inferior, 70s. to 85s.; good new, 80s. to 100s.; and straw, 44s. to 56s. per load.—Cumberland Market quotations:—Superior old meadow hay, 126s. to 132s.; inferior, 90s. to 105s.; new hay, 80s. to 105s.; superior old Clover, 132s. to 140s.; inferior, 100s. to 115s.; new Clover, 90s. to 120s.; and straw, 55s. to 60s. per load.

POTATOS.

At the Borough and Spitalfields markets on Monday there was a full average supply of Potatos on sale, and trade was good except for the better samples. Kent Regents, 100s. to 130s. per ton; Essex ditto, 100s. to 115s.; Shaws, 70s. to 100s.; Kidneys, 85s. to 120s.; Early Rose, 75s. to 100s.

COALS.

The prices quoted at the market on Monday were:—Walls End—Hetton, 20s.; Hetton Lyons, 17s. 3d.; Lambton, 19s. 6d.; Tunstall, 17s. 3d.; Hartlepool, 19s.; East Hartlepool, 19s. 9d. On Wednesday the market was quiet at Monday's rates.

WORTHINGTON SMITH'S

IN SOLUTION.

A Powerful Fertiliser,

An Unfailing Insecticide & Disease Preventive,

SUITABLE FOR

All Soils, Fruits, Vegetables, Flowers, and Grasses.

All PLANTS are at once greatly benefited by SALUS IN SOLUTION.

All PARASITES sink under SALUS IN SOLUTION.

Can be used through the Syringe, Vaporiser, or Watering Pot.

Directions for use will be sent with each parcel, or may be had gratis and post-free.

A 14 lb. box of SALUS is sufficient for 100 gals. of water.

A 7 lb. box of SALUS is sufficient for 50 gals. of water.

A Sample Packet of SALUS is sufficient for 5 gallons of water.

14 lb. for 14s.; 7 lb. for 7s.; Sample by post for 1s. 4d.

SALUS is sold as an excessively fine powder, and can be used in a dry state if desired.

"I feel it a public duty, as well as a personal pleasure of the highest kind, to be able to record this fact, and heartily congratulate Mr. Smith on the success of his SALUS in eradicating the Cucumber and Melon Disease.

"The whole of our plants, old and young, soon got infested with the disease,—they are now in robust health, without speck or spot, and are swelling off and ripening fine crops.

"The early Melons, badly affected at one time, are now carrying an enormous load of fine fruit—about a hundred in a small house—so we have reason to be proud of the powers of SALUS and grateful to its discoverer.

"Melons treated with SALUS took the First Prize at the fête of the Suffolk Agricultural Society.

"Our POTATOS were all dressed with SALUS—for the last six weeks their growth has been extraordinary. There is an immense crop of tubers, all sound, in these gardens." *D. T. Fish.*

"Potatos are in very good condition. Some little disease has shown itself in the haulm, but we have not found it communicated to the tubers. I have planted all my crop with SALUS." *William Ward, Stoke Edith, Hereford.*

ORDERS FOR SALUS

CAN BE SENT DIRECT TO

Mr. WORTHINGTON SMITH,
15, MILDMAY GROVE, LONDON, N.
Or his Sole Agents for Great Britain,
J. C. WHEELER & SON,
SEED GROWERS, GLOUCESTER,
and 59, Mark Lane, London, E.C.

A Microscopic Preparation of the actual Resting-spores of the Potato Fungus sent, post-free, on receipt of 2s.

ROYAL BERKS SEED ESTABLISHMENT.

PRICED LISTS POST FREE.

CHARLES VUYLSTEKE, NURSERYMAN,
Loochistry, near Ghent, Belgium.

Our ENGLISH CATALOGUE for 1877-78 is now ready, and may be had gratis on application. It contains description and price of Azalea indica, Azalea mollis, hardy Ghent Azaleas, Camellias, Kalnia latifolia, Rhododendrons, Stove and Greenhouse Plants, Bulbous Begonias, Dutch Flower Roots, &c. Upwards of 200,000 plants, of unusual beauty and strength, and disposable at very advantageous prices.

Agents: Messrs. R. SILBERRAD AND SON, 5, Harp Lane, Great Tower Street, London, E.C.

Fibrous Peat for Orchids, &c.

BROWN FIBROUS PEAT, best quality for Orchids, Stove Plants, &c., £6 6s. per truck. **BLACK FIBROUS PEAT**, for Rhododendrons, Azaleas, Heaths, American Plant Beds, 17s. per ton. Delivered on rail at Blackwater, S. E. R., or Farnborough, S. W. R., by the truck-load. Sample sack, 5s. 6d. each. Fresh SPHAGNUM, 10s. 6d. per sack. WALKER AND CO., Farnborough Station, Hant.

COCOA-NUT FIBRE REFUSE, newly made.—Reduced price, in 4 bushel bags, at 1s. 11d. bags included; or Truck-load, 25s. Delivered free to any rail in London.

J. STEVENS AND CO., Greyhound Yard, 134, High Street, Battersea, S.W.

B G I Oilcake.

ARREST YOUR PURCHASES of all other Cake until you have read the "Book of Testimonials" from users of this cake. Sent post-free by the Agent for the County, or by the Makers, Mills, Shad Thames, London, S.E.

GISHURST COMPOUND.—Used by many of the leading Gardeners since 1859, against Red Spider, Mildew, Thrips, Greenfly, and other Blight in solutions of from 1 to 2 ounces to the gallon of soft water, and of from 4 to 16 ounces as a winter dressing for Vines and Fruit Trees. Has outlived many preparations intended to supersede it. Sold Retail by Seedsmen, in Boxes, 1s., 3s., and 10s. 6d. Wholesale by PRICE'S PATENT CANDLE COMPANY Limited).

SCOTT'S WASP DESTROYER.—The only preparation made for thoroughly destroying Wasps, large Flies, &c. Sold in bottles, at 1s. 6d., 2s. 6d., and 5s. each. The larger sizes are the cheapest. May be obtained through any Seedsmen, or direct from

JOHN SCOTT, The Royal Seed Stores, Yeovil.

SIMPSON'S RED SPIDER, THRIPS, &c., ANTIDOTE. Testimonials of the highest order on application. Per quart, condensed, 6s.; per pint, 3s. 6d. Supplied to Seedsmen and Chemists. Strongly recommended in the Gardener, and by many first-class Gardeners.

Prepared by JOHN KILNER, Wortley, near Sheffield.

RUSSIA MATS.—A large stock of Archangel and Petersburg, for Covering and Packing (price on application for Archangel)—Petersburg, 60s. to 100s. per 100; superior close-weave, 40s., 50s. and 55s. per 100; Packing Mats at 20s., 30s., and 35s. per 100; and all other descriptions of Mats at equally low rates, at

J. BLACKBURN AND SONS, 4 and 5, Wormwood Street, London, E.C.

Wholesale Russia Mat Merchants.

ARCHANGEL and ST. PETERSBURG MATS, in any quantity, size and condition. RAFFIA FIBRE, CANVAS, TWINES, &c. MARENDAZ AND FISHER, James Street, Covent Garden.

RUSSIA MATS, for Covering Garden Frames.—ANDERSON'S TAGANROG MATS are the cheapest and most durable. Price List, which gives the size of every class of Mat, forwarded post-free on application.

JAS. T. ANDERSON, 149, Commercial Street, Shoreditch, London, E.C.

THE WORTHY-FIELD SAND PITS,
Heath, Beds.

(The nearest pits to the Leighton Buzzard Station.) The sharpest SILVER SAND, and the best adapted for Horticultural purposes; and all other descriptions of Sand to be obtained at the above Pits, in quantities of not less than 4 tons. Samples free by post. For prices apply to

J. L. BUSHELL (sole Proprietor), Leighton Buzzard.

Under the Patronage of the Queen.

J. SMITH'S IMPERISHABLE STRATFORD LABELS.

The above Labels are made of a White Metal, with RAISED BLACK-FACED LETTERS.

The *Gardener's Magazine* says:—"We must first give the palm before all other plant labels, as the very first in merit."

Samples and Price Lists free.

J. SMITH, The Royal Label Factory, Stratford-on-Avon.

WOOD TRAINING STICKS and TALLIES, commended by Royal Horticultural Society. BAMBOO CANES. RAFFIA for tying, VIRGIN CORK. ARCHANGEL and other MATS, PACKING MATS, &c. Wholesale prices on application to C. J. BLACKKITH AND CO., Cox's Quay, Lower Thames Street, London, E.C.

Indestructible Terra-Cotta Plant Markers. MAW AND CO.'S PATENT.—Prices, Printed Patterns, and Specimens sent post-free on application; also Patterns of Ornamental Tile Pavements for Conservatories, Entrance Halls, &c. MAW AND CO., Benthall Works, Broseley.

2 cwt. free to all Stations.

Prices, Patterns, and Testimonials Post Free.

WALTER CARSON & SONS, LA BELLE SAUVAGE YARD, LUDGATE HILL, LONDON, E.C. And 21, BACHELOR'S WALK, DUBLIN. No AGENTS.

Oil Paint No Longer Necessary.

HILL AND SMITH'S BLACK VARNISH for Preserving Ironwork, Wood, or Stone. This Varnish is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requires no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received, which HILL & SMITH will forward on application.

Sold in casks of about 30 gallons each, at 1s. 6d. per gallon, at the Manufactory, or 1s. 8d. per gallon carriage paid to any Station in the Kingdom.

UNSOLICITED TESTIMONIAL RECEIVED MAY 3, 1877. "The Ryleys, Alderly Edge, Manchester.—Messrs. Hill & Smith.—Sir,—For some 20 years I have used your 'Black Varnish,' and shall be glad if you will forward me another cask, as I consider it the best thing known for the preservation of all outdoor work, either wood or iron, that requires to be painted.—Yours respectfully, ALFRED LOWE, J.P."

Apply to HILL and SMITH, Brierley Hill Ironworks, near Dudley; and 118, Queen Victoria Street, London, E.C., from whom only it can be obtained

CAUTION.—It having lately come to the knowledge of HILL & SMITH that spurious imitations of this Varnish are being offered by unprincipled dealers at a slight reduction in price, they would especially draw attention to the fact that every cask of their Varnish is legibly marked with their name and address, without which none is genuine.

GARDEN REQUISITES, NURSERY-MEN'S and SEEDSMEN'S SUNDRIES.

Silver Medal, 1874.

THE TERMINAL SADDLE BOILER.—First-class Certificate, 1867; Highly Commended, 1873; and First-class Certificate, 1875.

"This Boiler possesses the rare merit of sucking all the heat from the fire."—Gardener's Magazine, p. 234.

"I have no doubt the Best Boiler, that will burn any kind of fuel, is the Terminal Saddle."—Journal of Horticulture, p. 377.

"For moderate cost and real efficiency the Terminal Saddle is one of the very best."—The Gardener, p. 95.

Prospectus post free.

T. JONES, Temple Street, Manchester.

JONES'S PATENT "DOUBLE L" SADDLE BOILER.

These Boilers possess all the advantages of the old Saddle Boiler, with the following improvements—viz., the water-space at back and over top of saddle increases the heating surface to such an extent that a "PATENT DOUBLE L SADDLE BOILER" will do about twice the amount of work with the same quantity of fuel; the cost of setting is also considerably reduced, and likewise the space occupied; at the same time these Boilers are simple in construction, and being made of wrought iron are not liable to crack. They are made of the following sizes:—

Sizes.	To heat of 4-in. Pipe.	Price.
High. 18 in.	18 "	£ 5. 0.
20 "	18 "	7 0 0
20 "	24 "	4 0 0
20 "	18 "	5 0 0
24 "	24 "	7 0 0
24 "	24 "	8 5 0
24 "	24 "	1,000
24 "	24 "	1,400
28 "	24 "	1,800

Larger sizes if required.

From Mr. CHARLES YOUNG, Nurseries, Balham Hill, S.W., May 29, 1873.

"Having given your Patent 'Double L' Boilers a fair trial at my Nurseries, I feel to say that they are most satisfactory. I consider them the best in use, and without doubt the most economical of all boilers; they will burn the refuse of other tubular boilers I have in work."

PRICE LISTS of HOT-WATER PIPES and CONNECTIONS, with Boilers, of all sizes and shapes; or ESTIMATES for HOT-WATER APPARATUS, erected complete, will be sent on application.

J. JONES and SONS, Iron Merchants, 6, Bankside, Southwark, London, S.E. When ordering Boilers please refer to the above advertisement.

**AGRICULTURAL LOCOMOTIVES,
STEAM PLOUGHING MACHINERY,
ROAD LOCOMOTIVES, TRAMWAY LOCOMOTIVES,
STEAM ROAD ROLLERS.**

For Prices, Description, and Reports of Working, apply to the Manufacturers.

AVELING & PORTER,

ROCHESTER, KENT; 71, CANNON ST., LONDON, E.C.; and 9, AVENUE MONTAIGNE, PARIS.

AVELING & PORTER'S ENGINES have gained the highest Prizes at every important International Exhibition. The two Medals for Progress and Merit were awarded them at Vienna for their STEAM ROLLERS and ROAD LOCOMOTIVES; and at the last trials of the Royal Agricultural Society of England their AGRICULTURAL LOCOMOTIVES gained the First Prize after exhaustive trials, when one of their 10-horse power Engines, fitted with single slide and ordinary link-motion, indicated 35-horse power, with a consumption of three and one-fifth pounds of coal per horse-power per hour.

AN EXTRAORDINARY BOILER.

During the Great Boiler Contest at Birmingham, in 1872, all Boilers were severely tested to prove their respective merits. One test was, "How long can each Boiler go without Night Attention?" However, one Boiler proved this to a surprising degree, as after being shut up for twelve hours (from 9 P.M. to 9 A.M.), it still retained its heat in 1000 feet of 4-inch pipes, and yet had more than 1 bushel of fire drawn from its furnace in the morning—equal, in point of fact, to seventeen hours of continuous firing. What a boon to Gardeners. This was THE CHAMPION, Deards' Patent Close-Coil Boiler, for Drawings and Prices of which send two stamps to

Messrs. DEARDS, Boiler Works, Harlow, who now have their Boilers at work in every county of England except three. Amateurs will also find THE WONDER, a smaller kind of Boiler, equally as satisfactory, and certainly "the best thing" out. Awarded five First Prize Silver Medals.

STEVENS' TRENTHAM GREENHOUSE BOILER,

After long experience, has proved the most SIMPLE, ECONOMICAL, EFFECTUAL, and LASTING BOILER extant; recently improved. For Illustrations, with full particulars, apply to the Sole Makers,

F. & J. SILVESTER.

HOT-WATER ENGINEERS, &c., &c., Castle Hill Works, Newcastle, Staffordshire.

MR. MECHE'S ADDRESS

to his OLD FRIENDS and CUSTOMERS and to the PUBLIC:—

"As it has been erroneously supposed by some that I am no longer interested in my London business, I think it desirable to state that I continue to carry it on as energetically, and I trust as satisfactorily to the Public, as formerly, assisted by my only son, who will in due time succeed me. It is now fifty years ago since I first commenced business in Leadenhall Street, and what changes have taken place! Then everybody shaved, and my razor and razor-strop trade was immense; now monstache and beard are the order of the day, and the razor and strop trade is comparatively deficient. Then there were no railways, so people stayed at home and used wooden dressing-cases; now everybody travels by rail, and we have dressing-bags to suit the altered conditions. Fifty years ago the poor geese supplied our pens, and many a now rich merchant in the City will remember the quality of Mechi's shilling pen-knives; but steel pens have extinguished the pen-knife trade and the penmaking machines, and the geese are in peace, except at Michaelmas. In fact, steam has altered, and I may safely say, improved everything, and has made us a nation of travellers both by land and sea. I wonder how much time is now occupied in reading the steam-worked press? and how much less time is occupied in slipping port wine, as we used to do fifty years ago, when we could not travel? Steam will make our 4-loaves cheaper some day, just as it has converted calico from 2s. 6d. to 6d. or less per yard. Then, again, a letter which used to cost 6s. 6d. to Cork is now carried for 1d. Sir Rowland Hill richly deserves a monument. But to return to business: fifty years ago, when I first commenced on a small scale, I made it an axiom that what I sold should be good and useful, and I believe thousands who used the strop and paste, which I personally invented, can testify to this; it fact, it was sometimes complained of that I stamped on my razors 'Exchanged if not approved.' I have never, and shall never so long as I live, deviate from that principle, because it is the true means to retain and increase one's connection. I devoted my attention especially to the quality and convenience of arrangements in the dressing bag and dressing case department, and in the tasteful selection of articles suitable for presentation, as well as on the matter of dispatch boxes and writing cases. Although both razors and penknives have 'gone out,' our sportsmen remain, and 'sporting knives' form one of our special departments. I feel firmly convinced that there is no fear of the departure of knives and forks, or dinners, so we make this an important department in quality and price. In conclusion, I ask no favours, but simply desire that my customers should compare the quality and price of my wares with those of other dependable establishments, and form their own conclusions. Most of my worthy assistants and workmen have been nearly forty years in my service, and long ago learned that civility and attention to our customers are as important as good quality in the articles sold. Illustrated catalogues will be forwarded post-free on application."

112, Regent Street, W., opposite Vigo Street.—1877.

Garden Fruit Tree Culturs.

THE MINIATURE FRUIT GARDEN.

Eighteenth Edition. By THOMAS RIVERS, 35, 6d., post-free, from Messrs. THOMAS RIVERS and SON, Sawbridgeworth, Herts; and Messrs. EDMONDSON BROS., 10, Dame Street, Dublin, Ireland. Sold also by Messrs. LONGMAN and CO., Paternoster Row, London, E.C.

THE COTTAGER'S CALENDAR OF GARDEN OPERATIONS.

By the late Sir JOSEPH PAXTON, M.P.

Reprinted from the *Gardeners' Chronicle*, with numerous Alterations and Additions.

Price 3d.; post free, 3 1/2d.

Post-office Orders are to be made payable to Wm. RICHARDS, at the King Street Office, Covent Garden, W.C.

Published at the Office of the *Gardeners' Chronicle*, 41, Wellington Street, Covent Garden, London, W.C.

Works on Botany, by Dr. Lindley.

DESCRIPTIVE BOTANY; or, THE ART OF DESCRIBING PLANTS CORRECTLY, in Scientific Language, for Self Instruction and the Use of Schools. Price 1s.

MEDICAL and ECONOMICAL BOTANY; or, AN ACCOUNT OF THE PRINCIPAL PLANTS EMPLOYED IN MEDICINE OR DOMESTIC ECONOMY. In One Volume, 8vo, with numerous Woodcuts, price 4s.

SCHOOL BOTANY; or, THE RUDIMENTS OF BOTANICAL SCIENCE. In One Volume, 8vo, half bound, with 400 Illustrations, price 5s. 6d.

THE ELEMENTS OF BOTANY, STRUCTURAL AND PHYSIOLOGICAL. With a Glossary of Technical Terms and numerous Illustrations. 8s. cloth.

This completes the series of Elementary Botanical Works by Professor LINDLEY, of which *School Botany* and *The Vegetable Kingdom* form the other parts.

The first two Parts of *The Elements of Botany*, comprising Structural and Physiological Botany, and a Glossary of Technical Terms, are published in one 8vo volume, price 6s.

These three Parts form a complete Manual of Botany for Medical and other Students who have made themselves acquainted with the Author's *School Botany*.

N. B. The Glossary may be had separately, price 5s.

A First-class Opportunity.

PARTNERSHIP.—A Nurseryman in the

South of England, carrying on a large Business as Nurseryman, Seedsman, Florist, and Landscape Gardener, and doing a large Cut Flower Trade, is desirous of meeting with a practical Man or Men, with money, who, if arranged, could take over the whole after a year or two. The business is capable of being largely increased. The reason for requiring a Partner is illness in the family, which compels the present proprietor to live away from the business.—Apply, in first instance, to Messrs. NUTTING and SONS, 60, Barbican, London, E.C.

PARTNERSHIP.—A Nurseryman, carrying

on a successful business within 25 miles of London, is desirous of meeting with a Partner. Failing health causes Advertiser to wish to find a man, or men who in, say, one or two years would be able to take over from him the entire business. Money would be required, but every facility be afforded provided substantial guarantees were given. The fullest references given and required.—Address, by letter, giving outline of means and position, NURSERYMAN, Messrs. Norris, Allens & Carter, Solicitors, 20, Bedford Row, London, W.C.

Gardener.

WANTED, in a Gentleman's Small Family in the Country, a thoroughly good GARDENER: must understand Vines, Forcing, &c. Man and Boy under him. Wife must be competent to undertake the Laundry Work. Good wages given; cottage, and all laundry necessities found. The highest testimonials required.—W. W. KNIGHT, Esq., Biltong House, Wye, Kent.

WANTED, within 14 miles of London, a

GARDENER (single), where a boy is kept, to live over the stables. Must understand Grapes.—Apply, stating age, salary required, and references, by letter, to C. E. W., Old Corn Exchange, London, E.C.

Gardener and Laundress.

WANTED, a MAN and his WIFE, the Man as Under Gardener and the Wife as Laundress. A cottage and firing, soap and starch, &c., found. Good wages given.—W. F., Messrs. Austin & Sons, Mercury Office, Hertford.

Nursery Foreman.

WANTED, an active steady MAN; must have good experience in Forest Trees, Conifers, Shrubs, Fruit Trees, &c.—Apply, stating age, salary expected, with references, to WM. SMITH and SON, Aberdeen.

WANTED, as NURSERY FOREMAN,

a single young Man, one that has had a few years under good foreman; mostly Indoors Work. Must understand Rose Budding.—Address, stating age, qualifications, salary required, to ALPHA, Messrs. Hurst & Son, Seed Merchants, 6, Leadenhall Street, London, E.C.

WANTED, a FOREMAN for the Houses.

Wages 17s. per week, with Buty, Milk, and Vegetables.—Mr. HARRISON, Norton Priory, Rancorn, Cheshire.

Foreman and Grower.

WANTED, a thoroughly conscientious practical MAN. Must thoroughly understand the Management of General Nursery Work, Budding, Grafting, and the Propagation of all kinds of Nursery Stock. As the situation is permanent, no one need apply whose character would not bear the strictest investigation.—Apply, stating age, if married, or single, and last situation, to E. WHITE, Bournemouth Nurseries, Bournemouth, Hants.

WANTED, a PROPAGATOR and

HOUSE FOREMAN in a Provincial Nursery, Hard and Soft-wooded. Good character indispensable.—Apply, by letter only, E. X., Mr. S. YATES, 16, Old Mill-gate, Manchester.

Propagator of Roses, Rhododendrons, &c.

PAUL and SON want a clever, experienced Man, as Propagator (Indoors) of Roses, General Hardy Stuff, and Soft-wooded Plants. Efficient help and every encouragement given to a really painstaking Man.—Apply, by letter, to The Old Nurseries, Cheshunt, N.

WANTED, an ASSISTANT PROPAGA-

TOR, under Glass; one accustomed to Nursery Work. Young man preferred (single).—JOSEPH GREEN, Garforth Nurseries, Garforth, near Leeds.

To Head Working Gardeners.
WANTED, for a small well equipped Garden, where a second-hand is kept, a **SUPERIOR MAN**, well acquainted with several branches of Horticulture. Wages 2s. a week and a good cottage.—Apply by letter, to B. D., Post-office, Sturmage, Herts.

WANTED, a Young Man, under the Foreman, about 25, accustomed to Budding, Grafting, Roses, &c., and General Propagating, Forcing Grapes, Peaches, Cucumbers, &c., and choice Cut Flowers. State wages and references.—M., Merton Abbey Nursery, S.W.

WANTED, for the Houses, Two experienced **MEN**. State previous experience. Wages, 18s. per week and Bothy.—GEO. CLARK, Clarence Nursery, Roehampton, S.W.

WANTED, an active, intelligent **YOUTH**, about 18 years, with some experience, for the Houses.—Apply, stating wages and reference, to JAS. CHAPMAN, Shardlow Hall Gardens, Derby.

To Assistants.
DICKSON, BROWN and TAIT, Seed Merchants, Manchester, are in **WANT** of an **ASSISTANT**. Must have a good knowledge of the Vegetable and Flower Seed Department; also required to Assist in Office occasionally. A young man having completed his apprenticeship would find this a favourable opening for improving himself. State age, wages required, and where last employed.

Junior Plant Salesman.
WANTED, in a Nursery near London, a **YOUTH** as **IMPROVER**; a moderate knowledge of Plants and their Value necessary. References must be unexceptionable.—State salary, age, &c., to S. C., *Gardeners' Chronicle* Office, W.C.

WANTED, an **APPRENTICE** to the Seed, Bulb, and Florists' Trade. Comfortable home with progressive salary. Small premium required.—Address, FARKOW AND CO., Sittingbourne, Kent.

WANTED, in a Small Nursery, 10 miles from London, a **CARMAN**; a young unmarried man preferred. Must be a good Manager of Horses, and willing to make himself generally useful.—State age and references to McD., *Gardeners' Chronicle* Office, W.C.

WANTED, a Man as **COWMAN**, and for General Duties; Wife must be a first-rate Breeder and Manager of Poultry. Very particular as to testimonials, as they would live in a cottage on the Estate.—E. N., Davies, Advertising Agent, Finch Lane, Cornhill, E.C.

WANT PLACES.

Head Gardeners.
JOHN LAING AND CO. can at present recommend with every confidence several energetic and practical Men, of tested ability and first-rate character. Ladies and Gentlemen in **WANT** of **GARDENERS** and **BAILIFFS**, or **GARDENERS** for First-rate Establishments or Single-hand Situations, can be suited, and have full particulars by applying at Stanstead Park and Rutland Park Nurseries, Forest Hill, London, S.E.

E. G. HENDERSON and SON have many excellent **GARDENERS** with approved testimonials for ability now waiting in their Nurseries for re-engagement.

E. G. H. & Son will be pleased to answer any enquiries from Noblemen and Gentlemen requiring such.—Pine-apple Nursery Maida Vale, London, W.

B. S. WILLIAMS, having at the present time several very excellent **GARDENERS** upon his Register, is desirous of placing them in Situations where great experience and trust are required. B. S. W. would at the same time beg to intimate that when a Gardener is applied for that the filling of the situation should be left with him, as that would prevent unnecessary correspondence and delay.—Victoria and Paradise Nurseries, Upper Holloway, London, N.

LANDSCAPE GARDENING.—The Advertiser has had good practice in the above, can make Surveys, prepare Plans of Ground Work, Horticultural and Agricultural Buildings; has good Horticultural knowledge.—9, Ridgway Road, Loughborough Road, Brixton, S.W.

GARDENER (HEAD), where one or two are kept.—Single; thoroughly understands the whole routine of gardening. Ten years' experience. Can be highly recommended.—T. C., The Sisters, Clapham Common, Surrey.

GARDENER (HEAD).—Age 32, married, no family; thoroughly practical in all branches of the profession. Good references.—W. G., 2A, Cirencester Street, Harrow Road, Paddington, W.

GARDENER (HEAD), where energy and ability would be appreciated.—Age 37, married. Good references.—A. B., Royal Horticultural Society, Chiswick Garden, W.

GARDENER (HEAD).—Age 30, married, no family; thoroughly acquainted with all branches of the profession. Good character from late employers.—G. L., Post-office, Middleton Stoney, Bicester.

GARDENER (HEAD).—Single; thoroughly understands Orchids, Pines, Vines, Melons, Stove and Greenhouse Plants, Flower and Kitchen Gardening. Good references as head.—G. W., Greenwood Cottage, Woodford, Essex.

GARDENER (HEAD), where one or more are kept.—Age 40, married, no family; thoroughly understands the profession Inside and Out. Left last situation owing to estate changing hands.—J. E., 17, York Rise, Kenitish Town, N.W.

GARDENER (HEAD).—Age 30, single; thoroughly understands the Cultivation of Vines, Pines, Melons, &c., Stove and Greenhouse Plants, Flower and Kitchen Gardening. Can be well recommended as Head Gardener.—A., Post-office, Emsworth, Hants.

GARDENER (HEAD).—Age 34, married, one child; thoroughly understands the profession in all its branches; good Melon and Grape Grower. Good reference from present employer as to character and ability.—A. D., Courtlands, Lympstone, Devonshire.

GARDENER (HEAD).—Age 30: good practical experience in the general routine of all Garden Work; for the past eight years has been Foreman at Rendcomb Park. Good character.—W. S., Mr. R. Lawrence, North Corney, Cirencester.

GARDENER (HEAD), where more are kept.—Married, one child; understands Vines, Peaches, Cucumbers, Melons, Stove and Greenhouse Plants, Flower and Kitchen Gardening, Alterations and Improvements. Excellent character.—Apply, with full particulars, to GARDENER, Whaddon, Salisbury, Wilts.

GARDENER (HEAD).—Age 32, married; thoroughly practical in Early and Late Forcing of all kinds of Fruits, Flowers, and Vegetables; has had sixteen years' experience in good Establishments. Five years' good character.—W. P., 13, Union Place, St. Leonard's Road, Weymouth.

GARDENER (HEAD), age 32, married.—W. SEDGLEY, for the last three years gardener to the late H. Compton, Esq., Manor House, Lyndhurst, Hants, is at liberty to engage with any Lady or Gentleman requiring the services of a good practical gardener; sixteen years' experience.—W. SEDGLEY, The Gardens, Manor House, Lyndhurst, Hants.

GARDENER (HEAD), age 41, married.—A GENTLEMAN wishes to recommend his Head Gardener to any Lady or Gentleman requiring a really useful and practical man; he has had under his charge for three years a considerable quantity of Glass, large Garden, Pleasure Grounds, Park, Plantations, &c.; he is also sober and trustworthy.—G. T. G., The Gardens, Cuthedge Park, Halstead, Essex.

GARDENER (HEAD, WORKING).—Married; thoroughly understands his profession in every department.—G. TANDY, Denton Cottage, Rugby Road, Leamington.

GARDENER (HEAD, WORKING).—Age 36, married; practical Indoor and Out. Seven years and eight months' good character. Can be well recommended.—X. Y., Post-office, Stanmore, N.W.

GARDENER (HEAD, WORKING).—Age 36, married; thoroughly practical in Early and Late Forcing of Flowers, Plants, Fruits, &c. Nine years' good character.—F. CROSS, The Down, Basingstoke, Hants.

GARDENER (HEAD, WORKING).—Age 39; good practical knowledge of the profession, including Stove, Vineries, Greenhouse, and Orchard-work. Nine years in last situation.—W. S., Gardens, Thornbury Castle, Gloucestershire.

GARDENER (HEAD, WORKING).—Age 30, married; understands Gardening in all its branches; also the Management of Stock and Arable and Pasture Land. Good character and testimonials.—F. GOODING, The Gardens, Beeding Wood, Horsham.

GARDENER (HEAD, WORKING), where one or two under are kept.—Age 45, married; understands Flowers, Vines, Greenhouses, Kitchen Garden, Wall Fruit, and Stock if required. Good references.—A. B., Post-office, Barnet.

GARDENER.—JOHN COWAN, The Vineyard, Garston, near Liverpool, would be glad to recommend to any Nobleman or Gentleman requiring a first-class Gardener a Man in the prime of life, who thoroughly understands the profession in all its branches, having had many years' experience in some of the best places in England and Scotland.

GARDENER (SINGLE-HANDED).—Age 22; understands Vines, Melons, &c.—F. PAULIN, Hainault Street, Ilford, Essex.

GARDENER (SECOND), where eight or nine are kept.—Good character.—DAVID EMERY, Morhanger, near Sandy, Beds.

GARDENER (SECOND), in the Houses.—Age 24; nine years' experience.—Excellent references as to character and abilities can be had by applying to the ESTATE MANAGER, Vale Lodge, Leatherhead, Surrey.

GARDENER (SECOND).—Age 22; understands Stove and Greenhouse; Vines, Flower and Kitchen Garden. Total abstainer.—J. A. GARNHAM, 6, New Lane, Enfield.

GARDENER (UNDER).—Age 20; five years' experience. First-class references.—H. B., 53, Hartland Road, Camden Town, London, N.W.

GARDENER (UNDER), in a Gentleman's Establishment.—Age 18. Three and a half years' experience. Good references. State wages.—A. P., The Lodge, Bromley Common, Kent.

FOREMAN, in a Nobleman's or Gentleman's Establishment, where Forcing is carried on extensively.—Age 23, single. Can be highly recommended.—H. PEKINS, 22, St. Ann's Road, Notting Hill, W.

FOREMAN, in a Nobleman's or Gentleman's Establishment.—Age 24; has a good knowledge of the Profession. Can be well recommended. Two years from last situation.—Apply, stating particulars, F. L., 48, Cochrane Street, St. John's Wood, N.W.

FOREMAN, in a Nobleman's or Gentleman's Garden.—Ten years' practical experience in all kinds of Plant and Fruit Growing, &c. Good references, and highly recommended.—M., 38, Duke Street, Chardon Road, Manchester.

PROPAGATOR, or **PROPAGATOR** and **FOREMAN** (INDOORS), long experience in Growing Hard and Soft-wooded Plants, Propagating, and Grafting.—ALPHA, 6, Barrow Hill Road, St. John's Wood Road, N.W.

To Nurserymen.
PROPAGATOR (GENERAL, HARD and SOFT-WOODS).—Good reference.—State terms, &c., to A., Mr. Beechey's, Southampton Terrace, Faringdon, Berks.

PROPAGATOR or **PLANT GROWER** in good Market Nursery.—Age 27; in last situation six years.—W. S., Mortlake Post-office, S.W.

PROPAGATOR.—Understands the Growing and Management of Soft-wooded Plants for market; Grapes, Cucumbers, &c.—H. B., 21, Winifred Place, High Road, Finchley, N.

To Nurserymen.
PROPAGATOR OF SPECIALITIES.—The Advertiser is capable of producing in any quantity, Azalia, Camellia, Clematis, Conifers, Hollies, Rhododendrons, Roses, and General Hardy Plants.—A. B., 20, Vining Street, Atlantic Road, Brixton, S.W.

To Nurserymen and Covent Garden Growers.
PROPAGATOR, or **SECOND**, to Grow Soft-wooded Plants.—Age 21; experienced. Good characters.—State particulars to C. A., 3, Dudnaston Terrace, Stanley Bridge, Chelsea, London, S.W.

JOURNEYMAN, in a good Establishment.—Age 22. Good references. Fruit department preferred.—A. B., The Gardens, Belton House, Grantham, Lincolnshire.

ASSISTANT, in a good Nursery.—Age 22; well up to the work, In and Out-door; six years' experience.—THOMAS, 1, High Street Row, Tooting.

IMPROVER.—A young Man, with a fair knowledge of Orchids and Stove Plants, seeks a situation in a large Establishment. Good references.—C. E., 9, Forest Road, East Nottingham.

To the Seed and Nursery Trade.
SHOPMAN (HEAD) or TRAVELLER.—Age 37; has had over twenty years' practical experience in all branches of the Trade. Is open for immediate engagement. X. Y. Z., Post-office, Glasgow.

SHOPMAN, CLERK, or TRAVELLER.—Well up in the Retail Seed Trade.—T. Mr. Knowles, Stationer, 44, Porchester Road, Westbourne Park, W.

SHOPMAN.—Young; good experience. Disengaged next month.—M. N., *Gardeners' Chronicle* Office, W.C.

SHOPMAN (ASSISTANT).—Age 19; four years' experience. Good references.—W. E., Wavertree Nursery, Wavertree, near Liverpool.

MANAGER, BOOK-KEEPER, or CONFIDENTIAL CLERK, in a Nursery or Seed Business.—Age 32. First-class references.—K. W., Strontian Lodge, Cotham, Bristol.

CLERK or MANAGER in a Provincial Seed Business.—Age 25; good experience.—F. N., care of C. Berry, 29, Paternoster Square, London, E.C.

To the Nursery Trade.
TRAVELLER or NURSERY SALESMAN.—The Advertiser, who has been for the last eight and a-half years Manager and Salesman in a large Scotch Nursery, wishes a situation as above. Good references and security if required.—W. PRICE, Howard Place, Edinburgh.

TO FLORISTS.—Permanent situation wanted by a steady Man (age 22); clever at Furnishing and Decoration; is a good Gardener and Florist.—G. B., 31, Southampton Street, Strand, W.C.

KINAHAN'S LL WHISKY.—Universally recommended by the Medical Profession. A pure old spirit, mild, mellow, delicious, and most wholesome. Dr. Hassall says, "The samples were soft and mellow to the taste, aromatic and ethereal to the smell. The Whisky must be pronounced to be pure, well-matured, and of very excellent quality."—Wholesale: 20, Great Titchfield Street, London, W.

DINNEFORD'S FLUID MAGNESIA.—The best remedy for ACIDITY of the STOMACH, HEARTBURN, HEADACHE, GOUT, and INDIGESTION; and the safest aperient for delicate Constitutions, Ladies, Children, and Infants. DINNEFORD AND CO., 172, New Bond Street, London, and all Chemists.

ELLIS'S RUTHIN WATERS.

PURE AERATED WATERS.

ELLIS'S RUTHIN WATERS.—Crystal Springs, Soda, Potass, Seltzer, Lemonade, Lithia, and for Gout, Lithia and Potass. Corks branded "R. ELLIS AND SON, RUTHIN," and every Label bears their Trade Mark. Sold everywhere, and Wholesale of R. ELLIS AND SON, Ruthin, North Wales. London Agents: W. BEST AND SONS, Henrietta Street, Cavendish Square.

HOLLOWAY'S OINTMENT and PILLS.—Common sense, ever the best of all learning, becomes invaluable when its practice will renovate broken health and reinstate soundness, strength, and vigour. Summer is the season for removing coughs, shortness of breath, wheezing, asthma, and all pulmonary diseases inflicted on the delicate and careless by our rigorous winters, and Holloway's remedies are the means of effecting a happy transition from danger to safety. After the harassed chest has been fomented with sea-water, or weak brine, and dried, this Ointment should be well rubbed into the skin, both in front and behind, between the blades-bones. Holloway's Pills should be taken to correct any functional irregularity; they will make each organ conform to health's requirements.

Send for a PRICE LIST of
**BLAKE'S SELF-ACTING
HYDRAULIC RAMS,**

For Raising Water for the Supply of
Villages, Irrigation, Railway Stations, Manstons,
Fountains, Farms.

No Cost for Motive Power, which is obtained from the
Stream of Water passing through the Rams.

NO OILING OR PACKING REQUIRED.

Made in sizes to raise from 300 to 100,000 Gallons per day.

WILL FORCE TO A HEIGHT OF 1,500 FEET.

This Ram will raise a part of the same water that works it, or will raise pure water from a well whilst it is worked by a stream of impure water.

TESTIMONIALS.

From the Right Hon. T. SOTHERN ESTCOURT, *Estcourt Park, Gloucestershire, September 6, 1875.*

"You will be glad to hear, as I am to tell you, that your Self-acting Hydraulic Ram has worked exceedingly well and continuously since it was erected, more than twelve months ago. It is, in fact, perfectly successful."

(The delivery pipe in the above case is 4200 feet long, with 100 feet rise.)

From Captain TOWNSHEND, *Wincham, February 10, 1877.*

"In answer to your inquiry, I am glad to say, the Hydraulic Ram you sent me in November, 1875, is working exceedingly well, and gives no trouble. It will work when quite immersed, as it has been several times during the floods this winter, forcing up water through a delivery pipe 900 yards long at the rate of 80,000 gallons per day, although you only promised 50,000."

From JOHN BARNES, Esq., *Contractor, Chaburn and Helli-field Railway, Contractor's Office, March, 1877.*

"Dear Sir,—I have the pleasure to inform you that the three Hydraulic Rams you erected for me on this contract about two years ago, have continued to work very satisfactorily, without requiring any repairing. With a fall of 5 feet sufficient water has been raised daily by each Ram to supply two of my locomotive engines, they have fully answered my expectations and all that has been said of them."

Deanwater, Wilmslow, November 20, 1873.

"Dear Sir,—In answer to your inquiries respecting the Hydraulic Ram you supplied me with six months ago, I beg to state that I am more than satisfied with it, as it is in perfect order, sending up to the top of the house about 2000 gallons of water in the twenty-four hours, whereas you only contracted to deliver at that time 500 gallons. I have, therefore, every reason to be well pleased with your work, and more especially as I had a Ram supplied me by another maker which could not send up a single gallon of water to the height required, and a second maker informed me that no Ram with a fall of 3 feet could send up water to the distance required, namely, 120 feet. But yours is an accomplished fact, and does its work most effectually.—I am, yours truly, L. HANMER."

From Mr. THOMAS MASON, *Alkinoates Hall, Colne, September 30, 1871.*

"Sir,—Your self-acting Hydraulic Ram gives me entire satisfaction; it has been at work about fifteen months, and has only been seen once during the last six months; it is forcing about 1400 gallons per day of twenty-four hours to a height of 104 feet."

From JOHN PENNINGTON, Esq., *Emmott Hall, near Colne, December 21, 1863.*

"Sir,—The Self-acting Hydraulic Ram you supplied me with nine months ago continues in excellent condition. It receives water from a spring through a 2-inch pipe, of which it forces 3600 gallons per day of twenty-four hours to a height of 90 feet, exceeding all you promised, and far surpassing the water wheel and force pumps which it has displaced. Its cost is small, it occupies but little space (2 square feet), and in mechanical detail is simplicity itself. I have much pleasure in recommending it as a cheap and efficient method of raising water."

**JOHN BLAKE,
ENGINEER, ACCRINGTON.**

TREE FERNS.

THE LARGEST AND BEST STOCK IN EUROPE.

WILLIAM BULL, F.L.S.,

Respectfully invites the Nobility and Gentry to an inspection of the above; also of his

MENTHA PULEGIUM GIBALTARI-CA.—Nice healthy Plants of this favourite new Carpet Bedder, so effectively used in the Victoria Park and elsewhere. Now is the time to secure and increase it, 5s. per 100, 40s. per 1000, post-free.
WILLIAM ABRAHAM, Fort Prospect Nursery, Limerick.

Gentlemen's Gardeners, Amateurs, and Others REQUIRING
GARDEN POTS of best quality, are requested to send their orders to J. MATTHEWS, Royal Pottery, Weston-super-Mare. Price List on application.

POSTPONEMENT—IMPORTANT NOTICE.—In consequence of a slight delay in the preparation, the Coloured Plate representing a selection of "CHOICE PLUMS" will not be issued until Sept. 15, instead of Sept. 8, as previously announced.

THE GARDENERS' CHRONICLE
for SATURDAY NEXT, September 8,
WILL CONTAIN A
SPECIAL TELEGRAPHIC REPORT
OF THE
GREAT INTERNATIONAL FRUIT AND FLOWER
SHOW at CARLISLE.

ROYAL HORTICULTURAL SOCIETY,
South Kensington, S.W.
NOTICE.—FRUIT AND FLORAL COMMITTEES' MEETINGS, on TUESDAY NEXT, September 4, in the Council Room, at 11 o'clock. GENERAL MEETING, for ELECTION OF FELLOWS, at 3 o'clock.

CRYSTAL PALACE.—**TWENTY-SECOND ANNUAL EXHIBITION OF FRUIT and CUT FLOWERS, FRIDAY and SATURDAY,** September 21 and 22. Schedules may be had on application to Secretary and Manager.
N.B. Rule 12 is cancelled.

ALEXANDRA PALACE.—The GREAT INTERNATIONAL FRUIT SHOW will be held on THURSDAY, FRIDAY and SATURDAY, September 12, 14, and 15, when Prizes to the amount of about THREE HUNDRED and FIFTY POUNDS will be offered for FRUIT, VEGETABLES, TABLE DECORATIONS, CUT FLOWERS, &c. Schedules are now ready, and may be obtained on application to JOHN A. MCKENZIE, 1 and 2, Great Winchester Street Buildings, London, E.C.

ROYAL PAVILION, BRIGHTON.—The BRIGHTON and SUSSEX HORTICULTURAL SOCIETY will hold their TWENTY-FIFTH GRAND AUTUMN EXHIBITION on WEDNESDAY and THURSDAY, September 12 and 13. Prizes are offered on the usual liberal scale of former years for Plants, Ferns, Cut Flowers, Fruits, &c. The Railway Cup, value 40s., is offered for the best ten varieties of Variegated and Ornamental Plants. Schedules of Prizes can be had on application to the Secretary, 66, St. James' Street; or of E. SPARY, Superintendent of the Exhibition, Queen's Graperies, Park Street, Brighton EDWARD CARPENTER, Sec.

HORTICULTURAL CLUB.—Gentlemen joining the Club now will not be required to pay a Second Subscription until January, 1879. Its central position and the fact that (unlike many Clubs) it offers Bed-room accommodation, give great advantages to Country Members. Prospectuses may be had on application to the HON. SECRETARY, 3, Adelphi Terrace, W.C.

To the Trade.
JAMES CARTER AND CO. have received their
FIRST CONSIGNMENT OF DUTCH ROOTS, and as the same have been personally selected by themselves in Holland, they think they will be found of good value. CATALOGUE sent in exchange for business card.
High Holborn, London, W.C.

STRAWBERRY PLANTS.—Strong well-rooted plants of the under-named varieties, 3s. 6d. per 100, purchasers' selection:—Aromatic, Amateur, Ananas Perpetual, Ascot Pine-apple, British Queen, Bicton Pine, Black Prince, Cockscomb, Comte de Paris, Cornucopia, Comte de Zans, Crimson Queen, Dr. Hogg, Duke of Edinburgh, Eleanor, Exquisite, Early Prolific, Enchantress, Eliza, Fairy Queen, Filbert Pine, Frogmore Pine, Grove End Scarlet, Garibaldi, Haiquin, James Veitch, John Powell, Keens' Seedling, La Grosse Sucree, Leon St. Lannier, La Constante, Lucas, Marguerite, Newton Seedling, Oscar, Prince of Wales, Prince Arthur, President, Premier, Princess of Wales, Royalty, Sir J. Paxton, Sabreur, Stirling Castle, Sir John Falstaff, Souvenir de Kieff, Scarlet Pine, Countess, Vicomesse Héricart de Thury, Victoria, Unza Fritz, Wonderful, W. J. Nicholson. Our selection, 2s. 6d. per 100, 20s. per 1000, in ten or twenty sorts, all true to name.
HARRISON'S MUSK, 2 plants 1s., 12 for 3s. 6d.
PRIMULA SINENSIS FIMBRIATA, of a splendid strain, 2s. per dozen.
WILLIAM CLIERAN AND SON, The Oldfield Nurseries, Altrincham.

To Nurserymen and Others.
ORNAMENTAL TREES and SHRUBS, a large assortment for Sale, including Aucuba japonica, Euonymus, green, golden and silver; Kay, sweet; Box, Cupressus macrocarpa, Cedrus Deodora, Thuja Warreana and gigantea, Laurustinus, Evergreen Oaks, Potted Trees, Pinus insignis, &c. Size and price on application. The above have all been well transplanted, and are now fit for removal. Also a large quantity of PINES, clean healthy plants—Queens, Smooth Cayennes, and Charlotte Rothschild. All applications to be made to Mr. B. OLLIVER, Foreman at The Nurseries, Northgate, Chichester.

To the Trade.
MESSRS. LEVAVASSEUR AND SON, NURSERYMEN, Ussy, Calvados, France, have an immense stock of Seedling FOREST TREES, Hardy, Coniferous, and other SHRUBS, for transplanting and transplanted; several millions of 1-year THORN. Priced CATALOGUES may be had of
 Messrs R. SILBERRAD AND SON, 5, Harp Lane, Great Tower Street, London, E.C.

New Plants for 1877.
B. S. WILLIAMS' ILLUSTRATED NEW PLANT CATALOGUE for 1877 is now ready, and will be sent, post-free, to all applicants.
 Victoria and Paradise Nurseries, Upper Holloway, London, N.

GEO. WHEELER, NURSERYMAN, SEEDSMAN and FLORIST, Warminster, Wilts.
CALCEOLARIA.—Geo. Wheeler's Superb Strain, being in habit very compact, stout, and dwarf, of great variety in colour, and beautifully marked. Is inferior to none. Retail packets, 2s. 6d., 1s. 6d. and 1s. each. Trade packets, 21s. to 5s. each.
 G. W. distributed his first raised hybrid Calceolaria in 1850, at 21s. each in trade; and in 1852 supplied many sorts of 6 plants each to the trade at 42s. the set.
IMPERIAL CABBAGE.—G. Wheeler's Improved Genuine, after a test of about half a century, still maintains its character of first-rate Early. A limited quantity still on hand at the rate of 1s. 2d. per ounce.
 Prepaid Orders for the above will be sent post-free.

CHARLES VUYLSTEKE, NURSERYMAN, Loochristy, near Gtnt, Belgium.
 Our ENGLISH CATALOGUE for 1877-78 is now ready, and may be had gratis on application. It contains description and price of Azalea indica, Azalea mollis, hardy Gent Azaleas, Camellias, Kalmia latifolia, Rhododendrons. Stove and Greenhouse Plants, Bulbous Begonias, Dutch Flower Roots, &c. Upwards of 200,000 plants, of unusual beauty and strength, and disposable at very advantageous prices.
 Agents: Messrs R. SILBERRAD AND SON, 5, Harp Lane, Great Tower Street, London, E.C.

ROSES.
CRANSTON'S NURSERIES
 KING'S ACRE, HEREFORD.
 (ESTABLISHED 1785.)

THE LARGEST ROSE GARDENS IN ENGLAND.

MESSRS. CRANSTON & CO.
 Beg to announce that their ROSES (extending over many acres) are now in full bloom.
 As considerable time will be required to inspect the whole of their Collection, Visitors to the Nurseries should take the morning trains arriving at Barr's Court, or Barton Stations, 2½ miles from the Nurseries, where conveyances are to be had.
 Rose Blooms for Decoration supplied.

POSTPONEMENT—IMPORTANT NOTICE.

In consequence of a slight delay in the preparation, the Coloured Plate representing a selection of "CHOICE PLUMS" will not be issued until September 15, instead of September 8, as previously announced.

THE GARDENERS' CHRONICLE

For Saturday next, September 8, will contain a

SPECIAL TELEGRAPHIC REPORT

OF THE

GREAT INTERNATIONAL FRUIT AND FLOWER SHOW AT CARLISLE.

THE GARDENERS' CHRONICLE

For September 15 will contain an

EIGHT-PAGE SUPPLEMENT devoted to HARDY FRUIT CULTURE,

AND A

BEAUTIFULLY COLOURED PLATE,

REPRESENTING A SELECTION OF

"CHOICE PLUMS,"

BY FITCH.

PRICE FIVEPENCE; POST-FREE, FIVEPENCE-HALFPENNY.

NOTICE TO ADVERTISERS.

As a very large extra circulation of this Number will be guaranteed, Advertisers desirous of securing space are requested to communicate at once with the Publisher,

W. RICHARDS, 41, WELLINGTON STREET, W.C.

MAY BE ORDERED OF ALL BOOKSELLERS AND NEWSAGENTS.

BOULTON & PAUL,

HORTICULTURAL BUILDERS,
NORWICH.

No. 75.—MELON FRAMES and FORCING FRAMES.

The largest Stock in the Kingdom, ready to be despatched on receipt of order.

These Frames are made of the best red deal, thoroughly seasoned, and fitted by first-class workmen; 24 in. high at the back, 13 in. high in front; painted three coats of good oil colour, glazed with best 21-oz. glass, every pane of which is nailed in and bedded in with putty—the best method of glazing known, and adopted by the most eminent Builders and leading Nurserymen (see *The Garden* for January 13, 1877, p. 30). Iron handles to each light, and an iron strengthening bar across. Each light is 6 ft. by 4 ft., and 2 in. thick.

CASH PRICES (Carriage paid).

SATURDAY, SEPTEMBER 1, 1877.

THE PRINCIPLES OF RATING.

THE law enacts that the rate shall be founded upon "the net annual value" of the rateable land or hereditaments. The Parochial Assessment Act, 6 and 7 William IV., cap. 96, defines "the net annual value" to be "the rent at which the same (land or buildings) might reasonably be expected to let from year to year, free of all usual tenants' rates and taxes, and deducting therefrom the probable average cost of the repairs, insurance, and other expenses, if any, necessary to maintain them in a state to command such rent."

In order to discover what the rent is, at which the property "might reasonably be expected to let from year to year," the place itself, and not the acts nor desires of landlord and tenant, must be chiefly considered. The test is, not what rent is actually paid, but what in the opinion of persons in general is the market value per annum of the property in question. A landlord, out of feeling of relationship or friendship, might be willing to accept an almost nominal rent from one particular tenant; or, another tenant might for some special reason be glad to pay a fancy price for the same premises. In neither of these cases would the rent be of that reasonable kind contemplated by the framers of the statute. In the former instance the sum paid per annum would only be a portion of the reasonable rent, while in the latter only a portion of the sum paid would be rent at all, the rest being a kind of premium voluntarily paid by the tenant by reason of the premises being of exceptionable value to him. In neither case could the rate be calculated from the rent actually paid.

It will be observed that the statute requires the rent to be such as could be reasonably expected from year to year, and not for a term of years. In the case of *Staley v. Castleton Overseers* (32 L. J., M. C., 178) the facts were that a silk mill was closed in consequence of the depression of trade. The owners of the mill appealed against the rate. Mr. Justice (now Lord) Blackburn decided that the rate was to be made upon the estimate of rent to be expected reasonably. A tenant would give nothing for it as a silk mill just then. Things might improve, and a tenant might be found who would take it for a term at a larger rent, but that was not the calculation intended by the Act. Again, in the case of the Attorney-General v. Lord Sefton (32 L. J., Ex., 230), it was held that duty did not attach to land that was unproductive at the time the defendant succeeded to it, though it might become very valuable in the future. Again, it was held in the *Tyne Coal Company v. Wallsend Overseers* (35 L. T., N.S., 854) that the colliery, which was drowned out, and had been so for six years, must be rated at its value from year to year as it was then, and not as if it were a going concern.

In each of the cases cited above the property had depreciated in value through no fault of the respective owners. In other words, the rate was to be calculated according to the present, and not the prior, nor future, nor speculative worth. In the case of *Harter v. Overseers of Salford* (34 L. J., M. C., 206), Mr. Justice Crompton said:

"If the premises are unlettable they are not rateable, but if they are unlet merely because the owner stands out for a higher price (*i.e.*, one above their reasonable value) they are liable to be rated at a fair rent." In the same case, Mr. Justice Blackburn laid down that where premises are to be let, and are not *de facto* let, in practice they are empty, and not considered rateable. But when the landlord retains possession, and has actually some beneficial occupation, he is rateable at least to the extent of that benefit.

No exact case is recorded of appeal upon rating of an unproductive nursery greenhouse, forcing frame, or vinery; but the cases above cited seem to point that the same principles should apply to this sort of property as are laid down in Staley's case and in that of the Tyne Coal Company.

GARDENING BY THE SEA.

A FEW lines on seaside gardening may not prove uninteresting to some of your readers. What I am about to notice is the bedding in the Queen's Gardens Inclosure, West Brighton. Only a few years ago, the area now so attractive was for the most part waste beach; now it is one of the most charming spots possible to conceive, adding another grand feature of interest to the queen of watering-places. The care of embellishing this spot was entrusted to Mr. W. Miles, who has fully exemplified what can be done by perseverance and skill, and it certainly reflects very great credit upon him. A well-kept lawn is bounded towards the inland frontage by a very neat and flourishing hedge of Tamarisk and Euonymus, which shelter about 1000 feet of a fine series of flower-beds. Banked in by a ridge of alternate horizontal and bay-like ridges of flowering plants, are formed seventeen ornamental beds of designs in carpet bedding that cannot fail to attract the attention of those who promenade this delightful spot.

Commencing at the end nearest Brighton, the first bed is of diamond shape. The edging is *Sedum lividum*, then a double row of *Echeveria secunda glauca*; the design is then worked out with *Alternanthera paronychioides*, lined in with *Pyrethrum Golden Feather*; and the ornamental brackets are panelled with *Alternanthera amœna* and *Sedum glaucum*, which produces a lovely effect.

No. 2 bed is of crescent shape, and is very attractive, by reason of the pretty arrangement of curious succulent plants. The carpeting plant used is the pretty white flowering, moss-like plant *Sagina procumbens*, which is perfectly hardy here, and which eventually will become a great favourite with those who delight in this style of gardening.

No. 3 is also remarkably effective—star-shaped, and pointed with the vivid *Alternanthera amœna*, edged and interlined with *Sempervivum* and *Mesembryanthemum*.

No. 4 is worked out with *Kleinia repens*; the inner design is manipulated with beautiful greens, compact-growing *Mentha Pulegium gibraltaria*—one of the neatest for this work. The inner designs are filled up with *Leucophyton Brownii*, the remaining brackets and panels being composed of *Alternantheras* and *Mesembryanthemums* in variety.

No. 5 is one of the most inviting in appearance, by reason of the beautiful arrangement of colours. The outer edging is *Sedum glaucum*, then a row of *Sempervivum calcareum*, next the *Mesembryanthemum cordifolium variegatum*. These three rows form the edging. The design itself is then worked out with *Echeveria secunda*, which forms eleven peg-top designs, which leave a small panel at the back and the large in the front. These panels are lined with *Golden Pyrethrum*, and filled in with *Alternanthera amœna*. The inner designs are lined with the beautiful *Alternanthera paronychioides*, followed up with *Golden Pyrethrum*, a circle then being struck with the compact *Lobelia pumila*, filled in with various novelties in white-foliage plants, which completely harmonise in colour.

I might go on enumerating the splendours in carpet-bedding which Mr. Miles has produced, but am afraid it would occupy too much space; I must not omit, however, to mention bed No. 11, which is very attractive, and claims attention from its peculiar design—a square-shaped bed with four points, *Sedum glaucum* lined with *Alternanthera*, the design being

traced out with the *Golden Pyrethrum* and panels of *Alternanthera amœna* and *spectabilis*, it is certainly one of the most showy of all.

Overlooking these beautiful beds is the front of the West Brighton estate, which a few years ago was waste land and fields; now it is covered with stately mansions, and beautiful detached and semi-detached villas. The planting of the avenues and laying-out of the grounds was also entrusted to Mr. Miles. The avenues are planted for the most part alternately with *Black Italian Poplars* and *English Elms*, and it is at once apparent that these are the best trees adapted for the seaside [Doubtful as to the Elm], whilst *Cupressus macrocarpa* and the *Euonymus* for other purposes will be found equally valuable.

I could not help noticing how beautifully *Clematis Jackmanni* was growing on the walls of the houses, flowering magnificently facing the sea. Passing up one of these beautiful avenues, and within a stone's-throw of the Cliftonville Station, are the West Brighton Nurseries of Mr. Miles, upon which stand several fine newly-erected houses (by Boulton & Paul, of Norwich). The houses are stocked with a fine selection of foliage and flowering plants, several of which have recently made their appearance at most of the shows in Sussex and Kent with great success. The class of plants principally grown are bedding and decorative plants, as Mr. Miles is entrusted with the principal of the decorations for public and private halls and dinner parties in Brighton, and for which he has gained a high reputation.

I must not forget to mention that outside, growing in beds for seed, are about 2000 plants of his new *Mignonette*. The plants are a very even lot; most of them are 2 feet high and as much through. It has a fine branching habit; the flower-spikes attain the height of 18 to 20 inches, 6 inches of which were covered when I saw them (August 19) with fully expanded flowers. It is more fragrant than the older forms, and cannot fail to become a special favourite. A. O.

THE TRADE OF THE STREETS.

THE costermonger with his barrow is an institution: he has taken possession of the trade of the streets, and has become an indispensable caterer for the multitude. His wares, laid out on an open barrow, lie for the ready inspection of every customer, and one would be apt to exclaim, that if those who spend their money with him do not get exactly what they want, it must be their own fault. In general this would be the case, but the costermonger, beyond his adult discriminating customers has a large *clientelle* of small children, who can scarcely be expected to know good from bad, and if they did are not likely to exercise much judgment in their eagerness to spend their halfpence. The costers generally drive a roaring trade, their barrows are covered with fruit, but the quality of this article seems to vary with the locality in which it is sold. In the City, the imported or home-grown fruits displayed on these shops upon wheels are excellent—indeed often so good as to compare favourably with that to be met with in the ordinary fruiterers' shops; but out in the suburban districts and along the bye-streets of a poor neighbourhood the goods of the itinerant vender of fruit present a very different picture. Instead of the well-grown, fully ripened Pears, Apples, and Plums, tempting to the sight and inviting even to the palate of an anchorite, little is to be seen save pyramids of windfalls, green, sour miniature Apples and Pears, together with stoeae fruit in the same unwholesome, nay, dangerous condition, which not even the eye of childhood, one would imagine, could look upon with favour; yet here they are displayed in heaps each morning, awaiting the juvenile purchasers, and by nightfall this accumulation of diarrhoea and cholera-inducing rubbish has been sold and devoured by scores of innocent children, who have not yet learnt to discriminate between that which is wholesome and that which is injurious.

We have inspectors of meat—the butcher who exposes bad beef, mutton, veal, or pork for sale may have it condemned and destroyed, and he be mulcted in a heavy fine beyond; should one ox be tainted with disease in a shipload the whole cargo of imported animals is doomed, and very properly, to immediate death; yet in regard to unsound fruit but little or no notice is ever taken of it, dealers may sell with impunity whatever trash they please, and thus fruit scarcely fit for the hog-tub finds its way into the small

obscure shops and into street barrows, and is finally consumed by children, more especially of the poorer classes, whose digestion is already weakened by want or improper food.

Is it strange, then, that under such circumstances as the fruit season advances and autumn comes on disease and death increase? That which Nature gives us as a blessing is turned into a curse. The earth brings forth her increase, the horn of plenty is full to overflowing, but in our densely populated towns the poor taste but rarely of the richness of the land, they consume the very refuse that should be set before swine.

With the advent of the fruit season comes also a sickening scene at Covent Garden Market, indeed at all our large fruit and vegetable markets, where scores of little children, ragged, dirty, barefoot and hungry, the very scum of the low purlieus of the neighbourhood, may be seen dodging under carts, diving under stalls, and stealthily stealing in and out of the precincts of the place to pick up the refuse, rotten fruit, and even vegetables, which have been thrown aside, and which are appropriated by these poor outcasts of civilisation, and greedily eaten.

Is it not possible to do away with such pitiable sights? Could not the refuse be at once carried to some receptacle conveniently situated for the purpose, and there shut up away from the eyes and fingers of these poor children, until finally removed by the scavenger. T. J.

NOTES ON THE BEDDING SEASON.

As with other outdoor departments of the garden, the bedding season cannot be said to have been a general success. Even *Pelargoniums* and their kindred associates have not quite filled up their allotted spaces till a very short period ago, and their stunted appearance in many exposed situations points to the difficulty of late propagation—a matter to be regretted, both for sake of the well-being of a future stock as well as the extra labour entailed in working up anything like a large quantity so late in the season. Out of misfortunes and reverses there are, however, lessons to be learnt, and if these lessons be turned to proper account they may prove invaluable in future arrangements. Whatever the general opinion may be of the present style of bedding, or however much the grandeur of our public parks may be admired, the one thing that should be paramount above all others is the selection of suitable plants for various localities. It is a simple piece of folly to ape at comparison without the same working facilities and climate, and yet what a miserable longing we northern gardeners seem to have for imitation.

Who has ever witnessed the beauty of Hyde Park or Battersea without catching infection? I dare venture to suppose that not one gardener in fifty can summon up fortitude enough to withstand the contagion that floats about in any or all of those lovely places, without making a resolve to go home and do likewise. Of course, it is always understood that we never leave home without adding some little to our stores of existing knowledge. No one, therefore, can be blamed for being an aspirant on the way to progress; but that progress should be a reality, which is not the case when our fondest cherished notions are upset by unfavourable seasons, and a wrong selection of plants unsuited for the particular locality in which we may happen to reside. We are led away in our endeavour to improve on an existing state of things by a chance season now and then, though I venture to predict that the season of 1877 will have cured many a sceptic outright. We shall be nearer the mark if we not only cut our coat according to our cloth, but also try to discern whether the cloth is adapted for its intended purpose or not. I apprehend that, as a plain matter of fact, our duty is, not to ape exactly the same plants that people grow elsewhere, but to try and get a similar effect in colour from plants that will grow early and thrive in our own climate. Subtropical bedding is, indeed, a bore not many miles north of London. We do not grudge Londoners their climate, though we would often wish to go shares with them, and try to enhance the name and credit of bedding northwards. Delicate plants will not live, much less grow and colour, in a season like the past; they must, therefore, be replaced by those that are of a hardy constitution, and are known to be possessed of such qualities as will adapt

THE GENUS AGAVE.

(Continued from p. 202.)

SERIES I.—CORIACEO CARNOSE.—Texture of the leaf rigid, not at all fleshy, nor yielding to the touch when mature. End-spine large, hard and pungent.

Group V. RIGIDÆ.—Edge of the thin rigid leaf without any distinct horny border; teeth deltoid, small, but distinct.

This is a considerable group, of which *A. lurida* and *Ixtli* may be regarded as the type, intermediate between the Americanæ and Aloideæ. From the former they may be distinguished by their more rigid habit, thinner leaves and small teeth: from the latter by their coriaceous texture and large pungent end-spines. Of the species of which the inflorescence is known, some belong to *Euagave* and some to *Littæa*.

* Leaves oblong-spatulate.

44. *A. Decaisniana*, Jacobi, Nachtrage, p. 28.—Acaulescent. Leaves oblong-spatulate, about 4 inches long, 3 inches broad at the middle, narrowed to 2 inches above the dilated base, a light rather shining green, the face concave, the terminal spine strong and blackish, the edge margined by crowded minute deltoid black teeth, which are rather recurved at the tip. Inflorescence unknown.

A native of Mexico, introduced about 1869. Described by General Jacobi from a specimen in the Jardin des Plantes, at Paris. So far as I am aware it is unknown in England.

45. *A. Warelliana*, Hort. Saunders; fig. 53.—Acaulescent. Leaves about 30 in a rosette, oblong-spatulate, 9-10 inches long, 3 inches broad above the middle, narrowed to 2 inches above the dilated base, nearly flat on the face, $\frac{1}{2}$ inch thick in the centre, green, scarcely at all glaucous, tipped with a strong brown channelled spine 1 inch long, the border margined with close deltoid prickles about $\frac{1}{2}$ line long, which are red-brown in a young state, and dark purple when mature. Inflorescence unknown.

This is a well-marked plant, which I do not find anywhere noticed. My description is taken from the specimen in the Reigate collection, from which the accompanying drawing was made. Probably it is a Mexican species.

46. *A. (Littæa) Botteri*, Baker, in Bot. Mag., t. 6248; fig. 54.—Acaulescent. Leaves about 50 in a rosette, oblong-spatulate, about 2 feet long, $\frac{1}{2}$ foot broad above the middle, narrowed to 4-4 $\frac{1}{2}$ inches above the base, pale green, hardly at all glaucous, concave in the centre, where it is $\frac{1}{4}$ inch thick, $1\frac{1}{2}$ inch thick at the base; the hard, pungent, channelled end-spine $\frac{1}{2}$ inch long; the marginal teeth crowded, deltoid, nearly black, $\frac{3}{4}$ inch long, upcurved at the tip. Scape twice as long as the leaves, covered with adpressed lanceolate bracts. Inflorescence a dense spike, longer than the leaves; primary bracts lanceolate, with a long point; the lower ones as long as the flowers; bracteoles as long as the perianth tube. Ovary under 1 inch long; tube funnel-shaped, $\frac{3}{4}$ - $\frac{1}{2}$ inch long; segments greenish-yellow, oblong, 1 inch long. Filaments 2 $\frac{1}{2}$ inches long, inserted at the throat of the perianth tube; anthers $\frac{1}{2}$ - $\frac{3}{4}$ inch long, linear, yellow, at first reddish. Style $\frac{3}{4}$ inches long; stigma capitate.

A native of Mexico, sent to Mr. Saunders by the collector after whom it is named. The plant from which the accompanying woodcut was made passed into the hands of Mr. J. T. Peacock, with whom it flowered in the spring of 1875. A full account, with a coloured figure, will be found, as cited, in the *Botanical Magazine*.

* Leaves oblanceolate-spatulate, decidedly glaucous.

47. *A. miradorensis*, Jacobi, Nachtrage, p. 31.—Acaulescent. Leaves about 30 in a rosette, oblanceolate-spatulate, 1 $\frac{1}{2}$ -2 feet long, 2-2 $\frac{1}{2}$ inches broad above the middle, narrowed to 13-21 lines above the base, thin but firm in texture, $\frac{1}{4}$ inch thick in the centre, very glaucous, with a firm red-brown end-spine 1 inch long, the side prickles very minute ($\frac{1}{4}$ - $\frac{1}{2}$ line long), deltoid, crowded and colourless, five or six to an inch in the centre of the leaf. Inflorescence unknown.

Said by General Jacobi to be a native of the banks of the River Tocantins, in the province of Goyaz, in Central Brazil. It is a well-marked plant, now to be seen at Kew and in other collections in this country, easily to be distinguished from all the forms of *lurida* and *Ixtli* by its very small crowded colourless prickles. Judging from the description alone, I strongly suspect *A. Desmetiana*, Jacobi, *Monogr.*, p. 241, to be the same species, in which case the last name takes precedence on the ground of priority. The name *miradorensis*, which is said by Jacobi to be what it was called in the Belgian gardens when he described it in 1869, points to a Mexican origin.

48. *A. (Euagave) lurida*, Aiton; Bot. Mag., t. 1522; Kunth, Enum., vol. v., p. 825; Jacobi, *Monogr.*, p. 109; *A. vera-cruca*, Miller, Gard. Dict., edit. vi., No. 7; *A. vera-cruca*, Jacobi, *Monogr.*, p. 111.—Acaulescent, or shortly caulescent. Leaves 30-40 in a rosette, oblanceolate-spatulate, 2-2 $\frac{1}{2}$ feet long, 2 $\frac{1}{2}$ -3 $\frac{1}{2}$ inches broad above the middle, narrowed to 21-24 lines above the dilated base, where it is $\frac{3}{4}$ inch thick, very glaucous, firm in texture, $\frac{1}{4}$ inch thick in the centre, the pungent red-brown end-spine $\frac{1}{2}$ - $\frac{3}{4}$ inch long, the rather distant prickles of the margin deltoid, $\frac{1}{4}$ inch long, shortly cuspidate, red-brown at first, finally nearly black. Scape, including the thyrsoid panicle, 12-16 feet long; bracts distant, linear, erecto-patent, the lower reaching 1 foot in length. Panicle 3-6 feet long, 1 $\frac{1}{2}$ foot broad, with 12-20 ascending branches; pedicels $\frac{1}{4}$ - $\frac{1}{2}$ inch long; bracteoles minute, lanceolate. Perianth greenish, 3-3 $\frac{1}{2}$ inches long; ovary oblong-cylindrical, about 2 inches long; tube funnel-shaped, $\frac{1}{2}$ inch long; segments oblong, 1 inch long. Filaments inserted at the throat of the tube, twice as long as the segments; anthers nearly 1 inch long. Style about 4 inches long.

A native of Mexico. Next to *A. americana*, this is the oldest and best-known of all the species. It is very fully described by Kunth and Jacobi, as cited above; a full account with a coloured figure, from a specimen that flowered with Mr. Saunders, in 1870, will be found in the *Refugium*.

Var. *A. Jacquiniana*, Schult. Syst., vol. vii. p. 727; Kunth, Enum., vol. v., p. 827; Hook. in Bot. Mag., t. 5097; Jacobi, *Monogr.*, p. 96; Belg. Hort., vol. ix., t. 25; *A. lurida*, Jacq. Coll., vol. iv., p. 94, t. 1.—Trunk 1 foot or 1 $\frac{1}{2}$ foot; leaf 2 $\frac{1}{2}$ -3 feet long; flowers smaller, 2-2 $\frac{1}{2}$ inches long.

This seems to be quite connected with the type by intermediate stages. *J. G. Baker.*

(To be continued.)

THE MUSEUMS OF ECONOMIC BOTANY, ROYAL GARDENS, KEW.

IN our last article (vol. vi., N. S., pp. 423, 584) we referred to the contents of the No. 1 Museum as the products of Exogens and those of No. 2 as being derived from Endogens, consequently we find in this building the produce of two natural families which are amongst the most interesting, and certainly the most important in an economic point of view—we allude to the Palmaceæ and the Gramineæ. This building was that which contained the original collection, in fact the first museum formed in the gardens, and is briefly described at the beginning of our last article. It will suffice then to say that the building consists of two floors, the central portion of the building being a large room with a gallery running round it. At each end are small rooms, numbered. Commencing on the upper floor, at the east end we find in No. 1 room numerous well-known commercial products, and articles of general consumption either in their own country or for exportation. First in the Dioscoreaceæ are fine specimens of Yams, the tubers of several species of *Dioscorea*, which are so largely cultivated and form such an important esculent in tropical countries. These tubers often grow to an immense size, and weigh from 30 lb. to 40 lb. each. They abound in starchy or farinaceous matter, and are eaten either boiled or reduced to flour. An entirely different product is the Sarsaparilla, the rhizome of *Smilax officinalis* and other species growing in Mexico,

Central and South America, and the West Indies. Numerous sorts are known in commerce under different names, varying in quality, and imported from different parts. The rhizomes are made up into bundles tightly bound round with the stems of some climbing plant, sometimes between 3 and 4 feet long, and 6 or 8 inches in diameter. The uses of sarsaparilla have been described as diaphoretic and tonic, and it has been extensively administered in chronic rheumatism, cutaneous affections, and generally, and, indeed, popularly, as a purifier of the blood. The efficacy of sarsaparilla is, however, at the present time very much questioned.

In the Orchidaceæ, a family of peculiar interest on account of the singularity and beauty of their flowers, we find but little of importance in an economic point of view. The only product of any real value belonging to the order is Vanilla, the fruit of *Vanilla planifolia* and allied species. These agreeably fragrant fruits, which grow in the form of a somewhat triangular pod, varying in thickness and length according to quality and kind, are largely grown in Mexico, Brazil, [the Mauritius, &c., and are used to flavour chocolate, liqueurs and confectionery generally. Belonging to the allied order Zingiberaceæ, we have fine commercial samples of the well-known condiment Ginger, the rhizome or root-like stem of the *Zingiber officinale*, a native of Asia, in the warmer countries of which it is now so generally cultivated that it is unknown in a wild state. It is likewise grown extensively in the West Indies, in Western Tropical Africa, and has been introduced more recently into Queensland. Here we have also represented the various kinds of Cardamoms, the fruits of *Elettaria Cardamomum*, an East Indian perennial plant 6 to 12 feet high, the uses of which are so well known for flavouring and in medicine; other kinds of Cardamom, furnished chiefly by species of *Amomum*, are also shown, as well as turmeric, which is the powdered rhizome of *Curcuma longa*, generally used in curries and Indian cookery as an aromatic condiment. It is largely cultivated in India and China. Passing to the other end of the room we see preserved in fluid a specimen of the rhizome of the arrowroot plant (*Maranta arundinacea*), which is cultivated very extensively at St. Vincent, Barbadoes, and Bermuda, as well as in Central and South America. From this rhizome is obtained the well-known and valuable food known as Arrowroot, to obtain which the scales are first removed from the rhizomes, which are then washed and ground in a mill, the pulp being afterwards washed on sieves, for the purpose of removing from it the starch, which is allowed to settle in clear water, and finally drained and dried with a gentle heat. Though Bermuda arrowroot has the highest reputation and realises the highest price in the English market, the supplies from the island are at the present time very small; the produce of the West Indies generally seems to be on the decline, and we receive arrowroot from other quarters, and notably from the colony of Natal. In the adjoining case to the arrowroot are the products of the Plantain order (Musaceæ), which yields not only the fruits known as Bananas and Plantains, and which form such an important article of food in nearly all tropical countries, but also the valuable fibre, Manilla hemp, obtained from the stems and leaf-stalks of *Musa textilis*, which is cultivated in the Philippine Islands for the sake of its fibre, the coarser kind being used for cordage and ropes, and the finer for textile fabrics. Here also may be seen the fruit of the celebrated Traveller's Tree of Madagascar (*Ravenala madagascariensis*), showing the seeds partly enveloped in a beautifully bright blue aril. The principal remaining economic products in this room are saffron, the dried orange-coloured stigmas of the flowers of *Crocus sativus*, a plant native of Asia Minor, but cultivated generally in Egypt and Southern Europe for the sake of the colouring matter, which is used for colouring and flavouring confectionery. Also various samples of the fibre of the American Aloe (*Agave americana*), with brushes and other articles made from it. This plant is generally known to us as a bold-growing inhabitant of our conservatories, the leaves of which abound in a coarse, strong fibre; but in Mexico, where it is abundant, the juice is drawn from it and fermented, when it forms a favourite intoxicating beverage, known as "pulque." Finally, we have under the Bromeliaceæ the Pine-apple (*Bromelia Ananas*), the delicious fruit of which is too well-known to need any further words. This plant, however, yields a very fine fibre, often used in the countries where it grows for delicate

fabrics almost identical with cambric. In this small room, then—the first in the arrangement of this Museum—are classified a large number of valuable and interesting products.

Room No. 2, still smaller, is entirely devoted to illustrations of Bamboos, and some of the multitudinous applications to which they are put. These gigantic grasses, of which *Bambusa arundinacea* is, perhaps, the best-known, are truly said by travellers to be applicable to almost every conceivable purpose. They are very rapid-growing plants, and in tropical countries quickly run up to a height of 50 or 60 feet. In China the leaves, simply dried, are very extensively used for lining Tea chests, being strung together by a thin cord passing through them. The sails, masts, and rigging of the vessels are all frequently made from Bamboo, as are also mats, screens, hammocks, and all kinds of furniture. The strong thick stems make excellent poles and posts for building purposes, and are constantly used for bridges. A few inches of the hollow stem, cut within a short distance of the joint so as to leave the joint itself for a bottom, makes a very good drinking-cup, and the larger stems thus treated are commonly used for water vessels; the split stems make excellent baskets, and when split very fine and plaited or woven, as is

alone amounting to about 7,000,000 cwt. annually. The Rice plant is found wild in India, where its cultivation dates from a very early period. Its introduction into China is said to date back some 4680 years. It was introduced about the year 1700 into the Southern States of America, and Carolina Rice is now one of the finest kinds imported, though at the present time it is cultivated in all hot countries where there is sufficient moisture to sustain it, for, being a marsh plant, its success depends upon the periodical inundation of the ground during certain stages of its growth (see *Gardeners' Chronicle*, 1876, vol. vii., p. 145). Even with us Rice is a most valuable article of food, being wholesome, nutritious, and, above all, cheap; nevertheless, it is not so extensively used by the poor as it ought to be and would be if the culinary art were better understood. In India Rice in the husk is universally known as paddy, but it seldom reaches England in this state. By removing the husk and winnowing it from the seeds the weight is considerably lessened, and consequently the cost of freight also. Of the numerous varieties of Rice known in India we need not speak, every one knows that in the English shops the different qualities are all distinguished, chiefly by the size and colour of the grain. The collection in the Museum is very

shining slate colour, and look more like shells than seeds. On account of their uniform size and shining appearance they are often used by the people where they grow for ornamental purposes as well as for rosaries. Close to the genus *Coix*—indeed, in the same case—is a sample of the so-called Canary seed (*Phalaris canariensis*). This corn is cultivated only sparingly in England, being grown only in a few of the English counties; nine-tenths of the annual consumption, which amounts to about 200,000 bushels, are obtained from Barbary, Turkey, and Holland. Its use is chiefly for feeding caged birds, and its greatest consumption is in the manufacturing districts of the North of England, the operatives mostly possessing a pet of the feathered tribe. Latterly, however, Canary seed has been used to some extent for feeding racehorses, owing to its reputation in forming muscle and not fat. We must pass over the numerous varieties of Millets, species of *Panicum*, *Setaria*, *Penicillaria*, and *Sorghum*, all important food-plants in India, China, Africa, and even in some parts of Europe, noting, however, as we pass, the novel way adopted by the natives of the Niger in stringing together the spikes of their Millet (*Penicillaria spicata*) for convenience in transport from one part of the country to another. In the specimens exhibited, which almost entirely covers the back of the case, the spikes, which individually are about

FIG. 53.—AGAVE WARELLIANA.

FIG. 54.—AGAVE BOTTERI.

often done by the Chinese and Japanese, a very beautiful fabric is procured. The young shoots are boiled and eaten, and a beverage is prepared from the fermented juice of the plant. From the rhizomes, with the brown fibrous roots still attached, the Chinese forms various grotesque figures or toys. Finally, at the joints inside the hollow stems of the plant is found a siliceous deposit known as "tabasheer," which is reported to possess tonic properties. Besides all the uses here enumerated, and which are fully illustrated in the Museum, the most recent application of the Bamboo in European trade is for the manufacture of paper, for which it seems admirably suited.

The order Graminacæ, which, as we have already said, commences with the Bamboos, is continued round the gallery of the large central room, the first plant illustrated being Rice (*Oryza sativa*). What Wheat is to us Rice is to the inhabitants of tropical countries, indeed to a large portion of the habitable globe; in fact it supplies food to a greater number of people than any other known plant, for not only is it the staple food in India—a failure in the crops nearly always resulting in a famine, as at the present time—but immense quantities are consumed in China and in the principal islands of the Indian Archipelago, as well as in America and Europe generally, the quantity imported into England

large, various kinds of Rice from different countries being exhibited, and also a large series of commercial samples. An ear of Rice is perhaps the most graceful of all the grasses, and when seen in quantity, as in a field, has a very fine effect.

In close contiguity to the Rice is another important food-giving grass, of a character very different, however, so far as appearance goes, to the last-named; we allude to Maize (*Zea Mays*), a plant often grown in our gardens during the summer season for its bold and effective appearance. The plant is believed to be originally a native of America, and it is now largely cultivated in North and South America, as well as in India, the East Indian Islands, Northern Africa, and in some parts of South Europe. The flour obtained from the grains of this well-known plant is so extensively sold under the name of corn-flour, that we shall pass on to a hurried notice of the remainder of the grass products. Close to the Maize we find numerous specimens of Esparto-grass (*Macrochloa tenacissima*), now so abundantly used for paper-making that it is feared the supplies from Algeria and other parts will before long be exhausted. Samples of mats, hats, and baskets made in Spain from this strong grass are also shown in this case. A singular grass seed is that which attracts our notice under the name of Job's Tears (*Coix lachryma*); they are somewhat oval, about a quarter of an inch long, very hard, of a

2 feet long, are secured by plaiting the stalks together, so that the whole can be easily rolled up or thrown across the backs of oxen. Any number of spikes can thus be attached; the specimen before us contains about 200. We must also pass over those grasses of British culture generally known to us as cereals, such as the all-important Wheat, Barley, Oats, &c., all of which are fully represented; and conclude our notice of this order by a brief reference to the Sugar-cane, *Saccharum officinarum*, *S. violaceum*, *S. sinense*, and perhaps other species or varieties. At the present time the Sugar-cane is chiefly cultivated in the East and West Indies, East Indian Islands, Mauritius, &c., for the supply of the European markets. The sugar consumed in this country was, until a comparatively recent date, derived almost entirely from the genus *Saccharum*; at the present time, however, we draw our supplies more largely from the Beet. Here we must leave the grass family; sufficient, perhaps, has been said to indicate its great importance and very varied products.

(To be continued.)

THE LINDLEY LIBRARY.

THE following donations have recently been made to the Lindley Library:—Presented by Lord Alfred Churchill: "History of Cultivated Vegetables," by Henry Phillips, 2 vols. 8vo, London, 1822; "Pomarium Britannicum," by Henry Phillips, 1 vol. 8vo,

3d edition, London, 1823; "A Treatise on the Culture and Management of Fruit Trees," by Charles Harrison, 1 vol. 8vo, London, 1823; "The Horticultural Register and General Magazine," 4 vols. 8vo, 1832—35, the first three volumes conducted by Sir Joseph Paxton, the fourth by James Main; "Letters on the Elements of Botany," by J. J. Rousseau, translated into English, with notes and twenty-four additional letters, by Thomas Martyn, 1 vol. 8vo, 6th edition, London, 1802; "Flora Rustica," 1 vol. 8vo, with coloured figures, by F. P. Nodder and Thomas Martyn; "The Forester's Guide, and Practical Planter," by Robert Monteath, 1 vol. 8vo, Edinburgh, 1824; "The North American Sylva," illustrated by 156 coloured engravings, 4 vols. 8vo, Paris, 1819. Presented by Dr. M. C. Cooke: "Mycographia seu Icones Fungorum," by Dr. M. C. Cooke, part 4. "Proceedings of the Academy of Natural Sciences of Philadelphia," parts 1, 2 and 3, 1875; presented by the Academy. Presented by M. Verein: "Verhandlungen des Naturhistorisch-Medecinschen Vereins zu Heidelberg—neue folge, erster band, fünftes heft, 1877." Presented by the Authors: "Remarks on the Superposed Arrangement of the Parts of the Flower," by Dr. Maxwell T. Masters, pamphlet; "De l'Épuration des Eaux d'Égouts," par Ch. Joly, Paris, 1877; "Descriptive Notes on Papuan Plants," by Baron F. Mueller, parts 4 and 5; "Notes for Observations on Injurious Insects," by Eleanor A. Ormerod; "Polygalæ Britannicæ," by A. W. Bennett; "Acta Horti Petropolitani," fasciculi 1 and 2; "Proceedings of the American Academy of Arts and Sciences," vol. iii, Boston, 1876; "Proceedings of the Fifteenth Session of the American Pomological Society," held in Chicago, Illinois, 1875; "Nouvelles Archives du Muséum d'Histoire Naturelle de Paris," four parts, 1873-4; "Contributions to Mycologia Britannica, the Myxomycetes of Great Britain," by Dr. M. C. Cooke, illustrated by 24 plates, London, 1877; "Tableau Général Méthodique et Alphabétique des Matières contenues dans les Publications de l'Académie Impériale des Sciences de St. Petersburg depuis sa fondation," ire partie; "Publications en Langues Etrangères," St. Petersburg, 1872, presented by Dr. M. T. Masters; "Bulletino della R. Società Toscana di Orticoltura," numbers 1—5, 1877; "The Royal Parks and Gardens of London," by Nathan Cole, London, 1877; "Thirtieth Annual Report of the Ohio State Board of Agriculture, for the year 1875," Columbus, 1876.

THE BRITISH ASSOCIATION.

LAVATERA SYLVESTRIS.

MR. H. TRIMEN, M.B., read a paper on *Lavatera sylvestris* recently found in the Scilly Islands. This Mallow was collected first in July, 1873, by Mr. Curnow, of Penzance; but during the past year it was found in abundance in the islands of St. Agnes and Tresco. The distribution of the species shows it to belong to the type to which the term "Atlantic" has been applied by Mr. H. C. Watson, who used the word to mark the species of this type, as well as others, confined to the West of England. *Lavatera sylvestris*, however, although agreeing with the true Atlantic type in its distribution, cannot be considered native in Scilly (as was supposed by its discoverer there), for these reasons: It was not seen there in 1863 by Mr. Townsend, a careful botanist, who published a list of the flora of the group; in the original station in St. Mary's it grows in company with *Reseda fruticulosa*, and, in the opinion of Mr. T. R. A. Briggs, looks clearly an introduction; it appears to have spread very rapidly at several points of the coast of Western France; and a few specimens have occurred near Penzance under circumstances which show their introduction to be merely casual.

INHERITANCE BY ANTICIPATION.

Mr. G. S. Boulger read a paper, "Notes on Anticipatory Inheritance in Plants, especially with reference to the Embryology of Parasites." This was designed to call attention to three groups of facts. The first group related to the embryology of parasites, epiphytes, saprophytes, and carnivorous plants, which were shown to agree in having fleshy perisperm, and, for the most part, to have reduced cotyledons. The cotyledons are absent in some, but not in all, leafless parasites and saprophytes, the latter class of plants having the most reduced type of embryology, on the whole. The second group of facts bore on the form of the young and mature leaves in *Tropeolum* and *Aucuba japonica*, and in seedlings of the latter species, which, in the writer's opinion, suggested that the immature and seedling leaves indicated an ancestral type now abandoned by the plants in favour

of more recently acquired forms. The third group treated of the resemblance of detail between the floral organs of certain plants and their leaves, under which head reference was specially made to *Sarracenia*, *Hypericum* and *Dionæa*. These facts, taken together, were held by Mr. Boulger to justify an hypothesis advanced by Mr. Darwin, that at whatever period of life a peculiarity first appears it tends to reappear in the offspring at a somewhat earlier age. For this accumulated effect Mr. Boulger proposed the name "anticipatory inheritance."

THE MOVEMENTS OF WATER IN PLANTS.

was the subject of a paper read by Professor M'Nab. Experiments made by him, and the results of which were published some time since, showed that the rapidity of the ascent of water in the xylem of the stem of a plant was nearly 40 inches an hour. Since the publication of the result Professor Pfizer, of Heidelberg, has made many experiments on the movement of water in plants. By him three methods were adopted. He first experimented by observing how soon leaves which had become flaccid from want of water regained their normal position when fed with the liquid. His second experiment was simply a repetition of that initiated by Professor M'Nab, viz., he used lithium, which could be detected with the spectroscope, instead of water. His third series of experiments combined both the other methods, and as a result of them it was found that in the Sunflower the velocity of the ascent of water in the xylem was nearly 22 metres per hour—that is, one-third of a metre, or 13 inches per minute. Later on, however, Professor Pfizer adopted a new method, suggested by Professor Koehne. He substituted a solution of indigo and carmine, such as is extensively used by microscopists for water and lithium, and the results obtained by means of it corresponded precisely with those recorded by Dr. M'Nab, who the method of experimenting was adhered to. An important source of possible error in conducting these experiments has, however, been pointed out by Professor Koehne, who has shown that the air or gases in the vessels of the wood of transpiring shoots are in a state of diminished tension. Shoots cut under mercury in a few minutes exhibit a rise of mercury in the stem of from 20 to 38 centimetres. In the Sunflower the tension of the air in the vessels equals 46 centimetres of mercury. This rise of mercury or other fluids in the vessels, due to diminished tension, Professor M'Nab styles the abnormal current, in contradistinction to the normal current through the xylem. If the abnormal current were more rapid than the normal, experimenters might be led into grave errors, but Professor M'Nab showed that there was demonstrative evidence that this condition does not exist.

PRIMROSES AND COWSLIPS.

A specimen of an abnormal floral development found by Professor M'Nab at Howth, in Ireland, was next submitted to the section. It consisted of a Primrose plant, from the stem of which grew a true Primrose and a Cowslip flower. Accompanying it were specimens of a hybrid plant, the flowers of which partook of the nature of Cowslips and Primroses; and the object of displaying them with the abnormal growth was to suggest how the mutation was probably occasioned.

NARCISSUS CALATHINUS.

THE department of Finistère, in spite of the scantiness of its flora, yet contains some rare plants which are only to be found within its boundaries. At Roscoff may be found *Amaryllis samiensis*, Herb., a plant which was imported from Japan a long time ago, and which has become perfectly acclimatised in that locality. A plant from the Cape of Good Hope, *Mesembryanthemum edule*, Linn., may also be seen there. The commune of Plougastel is equally famous for its Chili Strawberries (*Fragaria chilensis*, Ehrh.), which form an important article of commerce. A pretty Composite, *Helichrysum fetidum*, Gaert., also a native of the Cape, has flourished on the rocky shores of the coast between Brest and Le Goulet since the commencement of this century. *Oenothera stricta*, Ledeb., increases more and more on the old walls of the port and on the ramparts of the town; and *Gnaphalium undulatum*, Linn., is constantly found on the sands and heaths bordering the shore of the Channel between Lannilis and Cherbourg.

Leaving imported plants, and considering indigenous plants, we find some not less interesting. Thus in the adjacent isle of Crozon we find the magnificent *Lithospermum prostratum*, Lois., with its flowers of purplish blue, which certainly would not be out of place in any amateur's garden. The shores and heaths of the Elorn, between Kerhuon and Landerneau, serve as a retreat for *Cistus hirsutus*, Lamk., which is to be found in no other place in France.

Finally in the islands of Glenans, near Concarneau, is to be found *Narcissus calathinus*, Linn. (N. reflexus, Lois.) a pretty little bulbous plant, coveted by amateurs and botanists, which rebels against cultivation and threatens to disappear some day from the flora of France and forms the subject of this notice.

It was M. Bonnemaison, an apothecary of Quimper and a distinguished botanist, who first discovered it, between 1805 to 1810; since that time several botanists have seen it. They are M. J. Gay, in September, 1847, M. Flénon, de Lyon, April 6, 1863,* M. Duclombier, the inspector of the telegraphs, in 1866, and who first gave us information concerning it, and M. Besnou, the director of the Botanic Garden of Avranches, who wished to accompany us to that locality in May, 1869. According to the information rendered by the inhabitants, this *Narcissus* was formerly more abundant than it is now. It had existed in the isle of Penfret. M. le Men, keeper of the records of the department, stated that he had met with it in the island of Dreenc, but the increase of the population and of the industries have no doubt much contributed to exterminate the species, and at the present time the construction of weirs, &c., will cause it to disappear from here also. The St. Nicholas island is the only one of the Glenans isles on which we have found *N. calathinus*; it grows on a sandy mound, which runs in a N. by N.W. direction, nearly 6 or 7 metres from the sea coast, and covers a space nearly 50 metres long and about 10 wide. The mound is formed of light, black, gravelly soil, covered with rather thick herbage, partly composed of *Festuca duriuscula*, Linn.† Two other rare plants among our flora of Finistère may be seen with *Narcissus calathinus*: these are, *Omphalodes littoralis*, Mut.; *Leontodon bulbosum*, Linn.; and *Scilla nutans*, Sm.; and this is about all.

The appearance and elegance of the flowers of this little *Amaryllid* remind one of a *Cyclamen*, and have induced several horticulturalists and amateurs to try to cultivate them, but they have never succeeded. M. Paugam, Sen., a horticulturalist at Quimper, and a friend of Bonnemaison, seems to have been the first to attempt this culture, but without success. As he generally raised his bulbs in the open air, the plants flowered the first year, but entirely disappeared the next. M. Paugam, jun., afterwards tried to cultivate them in pots in a temperate greenhouse. By this means he was able to preserve the bulbs for two years, but at the end of that time they all perished. M. J. Gay states that he also had raised them, and seen them bloom at Paris for several years, and that then they had died. The first time we cultivated them we were not more fortunate than our friends at Quimper and Paris; we raised ten bulbs in the open air, which were not to be seen the following spring;‡ another ten were placed in pots under a frame: these last bulbs blossomed and died immediately. Out of fifteen flowers produced by these plants five or six ripened their seeds, which were sown as soon as they were gathered in little pots and placed in a frame. These seeds germinated in the following spring, and the plants were pricked out in August, after the leaves had dried up. The second year all care was taken to water them; the third, in 1870, they had nearly all produced one flower, after which they were separated and repotted the same year.

In 1871 the bulbs, which did not bloom the preceding year, bloomed in their turn; those which had already produced one flower produced two, and even three, and gave ripe seeds abundantly. In 1872 all flowered plentifully, and in the following year the strongest began to disappear without making many suckers. Nevertheless, some had one or two small ones, which were planted, but without any good results.

In 1872 one of our friends, M. Delachienne, the surveyor of bridges and roads, who was sent to the Glenans Islands to construct weirs for the reception of crustaceans, brought us some fresh specimens of *Narcissus calathinus*. This time he took large clods of earth full of bulbs, and placed them in baskets, to avoid waste during the journey. We placed these clods in similar earth, taking all possible precautions. We placed them in a sheltered nook, but fully exposed them to the sun. The following year some of the bulbs bloomed, but the second year all had again disappeared.

At the time of our journey to St. Nicholas Island,

* See *Bull. de la Soc. Bot. de France*, vol. x., p. 187.

† *Cronan, Florule du Finistère*, p. 204.

‡ *Bull. de la Soc. Bot. de France*, vol. x., p. 191.

in 1869, we carefully examined the soil and situation. We noticed that this *Narcissus* did not grow in the same way as do the majority of species of this beautiful genus—that is to say, in tufts consisting of several bulbs, which generally produce sheaves of leaves and flowers in the fields where they grow. This one, on the contrary, was found scattered here and there among the grass; one scarcely ever finds two or three plants of the same size together. This proves that this plant makes few offsets, that it increases most often by seeds which it produces abundantly, that each bulb dies after a certain time, and that those planted hitherto by amateurs have been adult bulbs; and, moreover, it seems that the reason why this species has not been cultivated successfully is that no one has paid any attention to the seeds.

We do not intend to occupy ourselves with the botanical characteristics;* it will suffice to say that the season of flowering is at the same time as at Brest, where it is cultivated, as in the Glénans Islands, about April 8 to 20, and that we have never proved any modifications of the flower or any varieties of the species.

To judge by our experience, it will be seen that as regards the culture of this *Narcissus* only seedling plants have flourished. This is how it is cultivated at the Botanic Garden of Brest. For the culture of the seeds, as well as for that of the bulbs, soil is mixed as follows:—One-fourth of gravelly soil, one-fourth of fine white river sand, and sea sand, that has long been exposed to the air, and one-half of fresh light earth, the whole being well mixed and sifted. We have said that only the seeds have any chance of success; we cultivate them according to the following method:—As soon as the seeds are ripe they are collected and sown in little pots of 3–4 inches in diameter across the top in earthenware pans, or anything porous. Great care is taken that the drainage should be good. As soon as the seeds are sown they are lightly covered with fine earth, watered, and placed in a frame near the glass. These seeds germinate in the following spring, and in August, when the leaves and the earth are dry, the pots are emptied on a sheet of paper, the clod of earth crushed, and the little bulbs taken out with great care. They are then pricked out, that is, placed by twenty or five-and-twenty at a time in pots similar to those in which the seeds were raised; fresh soil is given them, and they are planted a little deeper, so that when they are watered they are not uncovered. The second year there is nothing to be done but to water them well while they are growing; the third year they are again repotted, the small ones to the number of ten in each pot, the larger to five. They are placed in a cool greenhouse or under a frame, and in the following spring they produce their first flower. The second year they are in all their beauty, each stem bearing two, three, or even four flowers; the third year they begin to decline, and by the next year they have nearly all disappeared; or, if any offshoots remain, they are poor and weak, and unworthy of notice.

In spite of *Narcissus calathinus* being a wild plant, the cool greenhouse or the frame (with *Ixias*) are indispensable to it; it dislikes cold and damp; so that it should not be watered during the period of repose. This plant is not the only one of the locality that has the same characteristics: *Scilla verna*, Huds., *Diotis candidissima*, Desf., which grow on our coast, require a greenhouse in order to flourish in the botanic garden.† Perhaps in Holland, the country *par excellence* for the culture of flowering bulbs, this plant would have more chance of succeeding and giving satisfactory results. In consequence of the continual diminution of this *Narcissus* in the Glénans Islands, attempts at plantations of seeds were made by us in Béniguet Island in 1871, in the hope of acclimatizing the plant at this place. Up to the present time, we do not know the results, as the opportunities of obtaining this knowledge are very rare, and the expenses heavy. J. Blanchard, in the "*Revue Horticole*." See also *Gard. Chron.*, vol. I, n.s., p. 176.

A MONOTONE OF FLOWERS.

WHILE artistic gardening is becoming more and more popular, and the contrasting or blending of colours with a view to effect is gaining increased attention, while the art of dinner-table decoration is becoming a special study, encouraged by handsome prizes at every flower show, and while windows receive a no mean share of the gardener's attention, the homely yet pleasing and beautifying custom of placing vase bouquets in rooms is becoming neglected.

* See for these particulars, Lœsleure, *Recherches sur les Narcissus indigènes*, p. 42, 1810; De Candolle, *Fl. Fr.*, vol. 4, p. 324; Grenier et Godron, *Fl. de France*, vol. III, p. 261; Lloyd, *Fl. de l'Ouest*, 3d edit., p. 342.

† See the letter of M. Ch. Thiébaud, *Bull. de la Soc. Bot. de France*, vol. XXII, p. 30.

The epergne and the button-hole have each had a full share of consideration; the introduction and arrangement of flowers at feasts has been discussed in every paper, and the wearing of a button-hole bouquet been pressed upon the ruder sex as only a fit and proper encouragement to industry; but the latter is, so to speak, an individual and personal affair only, while to effect the former it is not only necessary to have the very choicest flowers, but a wealth of glass and silver as well—appendages of luxury not to be found in every middle-class dwelling, while chimney-vases full of flowers and bouquets on tables and brackets are every day matters, interesting to all, for they beautify home for those who live in it. Flowers of all descriptions are as fitting an ornament in the house-place of the cottager, as in the *salon* of the Duke; they impart an air of refinement to every room in which they are placed, and their tasteful arrangement should receive a due amount of care.

There are bouquets and bouquets: an intuitive perception and love of the beautiful will create a better effect with a few sprays of bloom than could be obtained from basket-loads of flowers unskillfully disposed.

Some persons appear to be endowed with an instinctive knack of tasteful arrangement; such indeed is the case with the Parisian *bouquetières*. "Every Frenchwoman knows how to convey a meaning to a few stalks turned one round the other, no matter whether it be the peasant girl binding wild flowerets, the young nun with Snowdrops for the convent altar, the Duchess with Violets, so displaying the imperial purple that her political opinions shall be conspicuous; or the Legitimist with a vase in which *Fleurs-de-lys* stand up right royally." Others, with as great a love for flowers, blunder on from day to day, never getting beyond the idea which is comprised in the expression a "posy" for the table. In our younger days this posy was to be seen quite fresh on a Saturday afternoon in every house. The posies, all of one pattern, and two, or at most three, varieties of flower, were culled from farmhouse and cottage garden, and were brought, along with the weekly complement of poultry and butter, to market. As was to be expected, but little diversity marked their appearance, the flowers only changing with the seasons; but no matter what the blossoms—Primroses and Gillyflowers in spring, Pinks and Roses in summer, or great staring red and yellow Dahlias in autumn—it was *de rigueur* that every nose-gay had a "backing" of green—Box as a rule, but sometimes Laurel, Laurustinus, Privet, Southernwood—anything, in fact, which happened to be plentiful and handy; the great art seemingly being to make up the greatest amount of foliage with the smallest quantity of flowers. Almost flat, and of a fan-like form, these bouquets were purchased by every housewife in the town. In the North of England in those days all women, high or low, rich or poor, attended the great Saturday market; the Metropolitan custom of sending round for orders, &c., did not then prevail; every housewife did her own shopping, and, whether her stores were taken home in a carriage, or borne in a capacious basket on her own strong arm, the posy was never forgotten; it crowned the day's purchases, and at home was placed, in the grim and artistic form in which it was sold, in some ornamental receptacle, where it remained until replaced by a fresh bunch of flowers the following week.

In all our large towns at the present day the *bouquetière* follows a recognised calling. At the time referred to she was unknown, save in two or three large establishments in the metropolis; indeed, so little was the art of domestic floral embellishment understood or appreciated that the posy aforementioned was as often the only expression of a love of flowers in the sitting-room as it was in the kitchen. Mistress and maid both liked fresh blossoms, both were equally at a loss how to evolve the largest amount of grace and beauty out of their weekly nose-gay. Within the last ten years we have changed all this; growing plants and cut flowers are the ordinary and daily ornaments of almost every home, and with a wider distribution of their beauty a better taste in their arrangement has arisen. In the same station of life at the present time at least one member of a household will know how to place flowers and foliage lightly and gracefully in vase or bowl; a leaf here, a blossom there, a spray of Fern or pendent flower will impart a charm to the arrangement which it would be impossible to obtain from any number of the choicest flowers lumped together without any regard to a pleasing artistic effect.

In recalling old times and old customs we have wandered from the subject-matter of our paper, and in case the title "A Monotone of Flowers" may prove a little incomprehensible, we proceed to explain it at once. By a monotone of flowers we wish to express the arranging of flowers all of the one colour, but of all shades of that colour, and should our use of words be considered out of keeping we shield ourselves under the plea of precedent; we have seen certain pictures catalogued as symphonies in grey, and harmonies in red and yellow, and when great artists thus employ words to express their meaning, we, humbly following in their footsteps, do the same.

Accident first taught us the chaste beauty of a monotone of flowers. Gathering some ordinary garden blossoms for indoor decoration, we were struck by the gorgeous loveliness of a handful of *Nasturtiums*, and resolved to try the effect of using these flowers and a little foliage alone. The blossoms were in profusion and furnished every tint of yellow, from the palest lemon to the deepest orange; some were blotched on the petals with a dark crimson patch, others of a self-colour were almost scarlet, others again pure unstreaked maize colour, some a deep orange-brown, almost black at the base of the petals; the varieties indeed were too numerous to remember, but one streaked red and yellow was quite novel, and so strikingly distinct that we christened it Tiger. Gathering a large basketful of flowers, we made choice of a large blue and white china bowl of a Japanese pattern, cranes flying over impossible mountains. In this bowl we placed an ordinary common glass goblet, and filling each with water, filled both with flowers. The effect was fine, and to soften the gorgeousness of such a brilliant mass three or four sprays of Maidenhair Fern were placed in the goblet, and allowed to droop over some of the lower flowers. It was necessary to arrange the blooms very lightly. When completed the pyramid was magnificent; so much, indeed, did it brighten up the room and centre attention upon its beauty, that again, following the example of artists, who, to avoid a too glaring effect of one colour, place the same in minor quantities in another part of their picture, we arranged the same flowers in smaller vases on chimney-piece and side-table, and found our "monotone of flowers" a perfect success. The dull corners of the room were positively lit up by the brilliancy of the blossoms, which came out in strong relief against the delicate pale drab, which was the prevailing tint of the walls.

In making choice of flowers, the aspect of the room might be taken into consideration. Roses would look superb, and impart a warm tone to a dull apartment, as did the *Nasturtiums*; while a room open to much sunlight might have freshness and coolness suggested by a monotone of flowers in all the various shades of blue. *Jane Ferriold*.

PLANT PORTRAITS.

AMPELOPSIS TRICUSPIDATA, *Belg. Hortic.*, 1877, t. 11.—The plant, generally known as A. Veitchii, deservedly esteemed for its neat foliage, hardihood, and power of attaching itself to walls without the aid of nails. Out-of-doors the leaves are small, but when grown under glass, as in the temperate-house at Kew, the leaves become very large and coarse.

BEGONIA DAVISII, Hook. fil., *Belg. Hortic.*, 1877, t. 12.—An acknowledged reproduction from the *Botanical Magazine*, t. 6252.

DIANTHUS GLACIALIS, *Floral Mag.*, t. 268.—A charming, slow-growing alpine, with short linear leaves and relatively large rose-lilac flowers. It is a veritable gem, but impatient of stagnant moisture.

HOULLETIA PICTA, Rehb. l., *Bot. Mag.*, t. 6305.—A New Granadan species, figured from the collection of the late Bishop Sumner, at Farnham Castle. The pseudobulbs are ovate-lanceolate, giving off long-stalked, broadly lanceolate, plicate leaves. The racemes of flowers are given off from the base of the pseudobulb, each flower being $3\frac{1}{2}$ inches in diameter, with oblong-lanceolate sepals and petals, of a yellowish colour outside, brown and barred on the inner surface. The lip is shorter than the lateral petals, joined in the middle, and provided with two recurved horns.

IRIS SPECULATRIX, Hance, *Bot. Mag.*, t. 6306.—A native of Hong-Kong, with linear, grassy leaves springing from a thick, creeping rootstock. Flowers about 2 inches diameter; "falls" lilac-coloured, with

a central yellow spot, bordered with a deep purple margin. Flowered at Kew in April.

MASSANGEA MUSAICA, E. Morr., *Belg. Hort.*, 1877, t. 8-9.—This is the plant known in gardens as *Tillandsia musaica*, but which has been considered by M. Morren as the type of a new genus. The flowers are borne in terminal close heads on an erect scape, provided with scarlet bracts. The calyx is brownish, ivory-white at the apex, the corolla is snow-white.

TILLANDSIA USNEOIDES, Linn., *Bot. Mag.*, t. 6308.—A very interesting plant, having more the appearance of a moss or a lichen than of a flowering plant. In its native country, Tropical America, it grows on trees in the shape of long, intricately branching, slender threads, covered with small silvery scales, whence the name "Old Man's Beard." Though often introduced as a packing material, it has rarely flowered in our stoves. The present plant flowered at Kew in the spring.

TULIPA UNDULATIFOLIA, Boiss., *Bot. Mag.*, t. 6308.—A species introduced from Smyrna by Mr. Elwes, and which flowered at Kew in May. The glaucous leaves are wavy at the margin. The flowers are about 2 inches in diameter, with narrow, lanceolate, perianth segments of a bright crimson colour, each marked at the base with a purple spot edged with yellow.

TESTING SEEDS.

The sample of the seed to be examined is taken from the barrel or bag, with instruments made for the purpose, or in such other way as to secure a perfect average sample. This, when brought to the laboratory, is thoroughly mixed, and a small part of it withdrawn, with very special precautions to ensure its representing the average quality of the whole. This portion, from 2 to 15 grammes ($\frac{1}{16}$ to $1\frac{3}{4}$ oz.), according to the kind of seed, is next carefully made, and then picked over by the examiner, seed by seed, with the aid of magnifying glasses and other instruments designed for the purpose. Each seed passes under the eye—the genuine seeds, those corresponding with the label under which they were sold, are put by themselves in one place, and the foreign matters, whether seeds, chaff, dust, or sand, in another. The pure seeds are weighed by themselves, and the impurities also.

In this way we learn the percentage of pure seed. For instance, suppose we take 4 grammes of seed, and find, after picking it over, 1 gramme of impurities, and 3 grammes of pure seed. We make then the proportions, 4 : 3 :: 100 : 75, *i.e.*, our sample contains 75 per cent. of pure seed, and 25 per cent. of impurities. The foreign seeds are examined botanically, to see if there are among them any which would produce parasitic plants or weeds poisonous to cattle. If there are, such an article should be at once rejected by the farmer. The germinating power of the pure seeds is next ascertained, as follows: Two lots of 200 seeds each are carefully counted out, and, after being weighed, are allowed to soak in distilled water twenty-four hours. They are then transferred, the one lot to an apparatus of porous earthenware, the other to a wrapper of bilobulous paper.

The figures herewith (fig. 55, 56) represent Dr. Nobbe's apparatus for testing the sprouting power of seeds. It is made of burnt clay or earthenware, and consists of two parts—the base and cover. The base is about 8 inches square, and has in the middle a circular depression, about 4 inches wide and $\frac{3}{4}$ inch deep, which serves as a receptacle for the seeds. Around this "germinating bed," as it is called, runs a canal, a little over an inch deep, for water, which soaks through the porous material, and keeps the seeds moist. The base is glazed on the bottom, and part way up the sides, to prevent the water running through and wetting the support on which the apparatus rests. The cover is of the same material as the base, and fits over it like an ordinary paper-box cover. In order to allow circulation of air through the apparatus, the cover is somewhat wider than the base, and each interior corner is provided with a projection. It is thus prevented from closing down tight upon the base, and room is left on all sides for free movement of the air. A small aperture is left in the top of the cover, in which a thermometer may be inserted, if desired, for determining the temperature.

Supposing now that the seeds have been counted out, as above mentioned, in two lots of 200 each, soaked, and one lot put into the moistened paper. The other lot is laid in the germinating bed of the

apparatus, which is kept moist by the water in the surrounding canal, the cover is put on, and the whole set in a convenient place, where the temperature is fit for the germination of the seeds. From time to time the cover is taken off, the seeds are examined, and those which have germinated are removed. The date of each counting, and the number which have germinated, are entered in a book kept for the purpose. At the expiration of ten days or two weeks, in most cases, the trial is concluded. The number which have sprouted, all told, is found, and to it is added one-third of the number which have remained sound during the experiment, and yet show no disposition to sprout. The number is divided by two, and the quotient taken as the number of seeds in 100, *i.e.*, the percentage which will sprout. The object in making two sprouting trials, one with the apparatus and one with the paper, is to provide a check on any possible

FIG. 55.—NOBBE'S SEED-TESTING APPARATUS: BASE.

mistake, which might pass unnoticed in a single experiment.

As was said, these 400 seeds were weighed previous to the sprouting trial. From this we calculate the weight of 1000 kernels. This is not an unimportant item in judging of the good quality of the seed. Heavier seed, other things being equal, is to be preferred to light seed.

From the percentage of pure seed in the sample, and the percentage of pure seed capable of germination, we calculate the "agricultural value," which expresses the percentage, or proportion by weight of the sample, which may be expected to furnish plants of the kind indicated by the label.

The report returned to the persons sending in the sample will run as is illustrated by the following example:—

The following is the result of examination of *Tri-*

FIG. 56.—NOBBE'S SEED-TESTING APPARATUS: COVER.

folium pratense—red Clover, received March 21, 1877, from John Smith, Middletown, Conn.

Pure seed	94.3 per cent.
Impurities	5.7 "
Pure seed capable of sprouting	89 "
Agricultural value	83.9 "
One thousand seeds weigh	1.59 grammes

The seed is accordingly of good quality.

As was said last month, the tests made at our laboratory indicate a remarkably favourable condition of the seeds sold in our markets, as to purity and vitality. But our examinations have not been extensive enough to enable us to judge accurately of the general state of the seed market, and where there is so much of opportunity for both innocent and wilful wrongdoing, a check must always be valuable. The interest is of too vast importance to the agriculture of the country to be neglected.

I wish to add a word about the germinating apparatus above described, and particularly to invite the careful attention of sellers and users of seeds to its merits. All of the methods commonly employed for

* Consisting of chaff, broken seeds, and a little Swedish Clover—*T. hybridum*

testing the sprouting power of seeds are open to more or less objection in one way or another. When sand or earth is used, aside from the danger of presence of foreign seeds, and of improper covering, it is difficult to maintain a uniform and fit degree of moisture, while the process of germination cannot be watched without disturbing the seed. When paper or cloth is used, the seeds are liable to be disturbed, or come in contact with each other, or surrounding materials, in such way as to do injury, and there is danger that the covering will be allowed to get so moist as to exclude access of air, or so dry as to injure the germination. Nobbe's apparatus has all the advantages of simplicity, cleanliness, and convenience, offers abundant room for spreading out the seeds, so that they will not come in contact, while those that have germinated may be removed without disturbing the others, provides for the entire exclusion of light, plentiful access of air, maintenance of a proper temperature, uniform and fit degree of moisture, and allows the seeds to be examined at any moment, and the whole process of germination to be followed with the utmost convenience, and with no danger of injury whatever. *American Agriculturist*.

Notices of Books.

The Royal Parks and Gardens of London, &c. By Nathan Cole. With numerous wood engravings and geometrical designs. *Journal of Horticulture* Office, 171, Fleet Street, E.C.

The book before us is, as its title indicates, devoted to the history and mode of embellishment of the London parks, and contains hints on the propagation and culture of the plants employed, the artistic arrangement of colours, &c. "The information conveyed is thoroughly practical, for it is a record of the experience of one who has for many years been engaged in the propagation, culture, and planting of the flowers in the parks referred to." In accordance with the aim of the author, as thus expressed, the sections of his work devoted to the arrangement of colours in flower-beds, the mode of planting carpet and other beds, are far better than the earlier chapters devoted to the history and description of the several public parks and gardens round London. The historical and descriptive portion is indeed written without pretence of literary style or research, and is meagre and unsatisfactory.

A quarter of a century ago, nay, scarcely more than a dozen years ago, it was an accepted article of faith that trees would not grow in London, that flowers were an impossibility, and gardens a delusion. Yet even at that time Kensington Gardens and Hyde Park bore testimony to the contrary; the flower walk in Kensington Gardens was a delight then as now, and the Regent's Park and the Royal Botanic Gardens, thanks to Mr. Marnock, were powerful protests against the doctrine in question. Sometime afterwards came Victoria Park, with its rich collection of trees and shrubs; and then the swamps and flats of Battersea were made beautiful with undulating shrubberies, belts of trees, serpentine walks, wide lawns, limpid lakes, and, last not least, glades and sheltered nooks, where, thanks to John Gibson, Palms of stately outline, tree Ferns, noble-foliaged Araids and other plants, which, for want of a better name, were called sub-tropical, luxuriated as if London and its smoke were miles instead of furlongs away. Then the fine ladies and gentlemen who visit Paris, and frequent Hyde Park in the season, had their requirements satisfied, and miles of flower-beds decorated the sides of Park Lane and other spots in the Park. Of the popularity of these flower-beds there can be no question, but there are too many of them, the colouring is often glaringly offensive, and the intrinsic interest is *nil*. The popular taste wants educating, but all the time the public manifest a demand for these chromatic aberrations so loog will the gardeners supply them, though the cost and labour are great, and the gardening skill and knowledge required but small. An eye for colour and a refined taste are, however, required, and if they were possessed as they should be the flower-beds would not only be better arranged, but their number would be diminished at least one half, and the stretches of green turf and fine-foliage plants correspondingly increased. Let any one compare the garden at the Royal Horticultural Society, South Kensington, now that most of the flower-beds are done away with and turfed over, with what it

were a few years ago. Instead of being worried and fatigued, the eye now rests placidly on green turf, and one great feature of a garden, "repose," is much more fully secured.

The practical hints and plans in the present volume are valuable, but on the whole the text is unsatisfactory, and the illustrations worse.

Select Orchidaceous Plants. By Robert Warner, F.R.H.S., F.L.S.; the Notes on Culture by B. S. Williams. London: Reeve & Co.

We are glad to see this work making its appearance, in the shape of the first part of a third series. For an expensive publication like this, the fact that two series have already been issued in numbers, and a third series commenced, each series making a handsome volume, is pretty good evidence of the high quality of the work, and this indeed was to have been expected with the talent and experience which Mr. Fitch brought to bear on the artistic departments, and Mr. Williams' practical experience reflected in the cultural instructions. We could only wish the work appeared with more regularity. As yet it has come out by fits and starts, and no one knows when to be on the look-out for it, which would not be the case if a number were issued, say quarterly, or even half-yearly, if the three months' interval were considered too brief.

The present part opens with a plate of *Lælia Warneri* (t. 1), a fine plant, which is regarded as belonging botanically to a distinct section of *L. elegans*, verging towards *L. purpurata*. The figure more nearly resembles the latter, the flowers being large, almost white, with a very rich purple lip. It appears to have been imported by Mr. Warner direct from Brazil, and about the same time as, or along with, *L. gigantea*. *Vanda teres Andersoni* (t. 2) is a splendid form of this fine Orchid, standing out as a freer bloomer, with the racemes larger, and the flowers richer and brighter in colour than those of the type. This was figured from a plant in Mr. Williams' collection, which, though of comparatively small size—only 2 feet high—produces flowers every year, thus proving itself to be a free-bloomer, "which *Vanda teres* is not, since it has to grow several feet before it shows any signs of producing blossoms." The remaining subject is *Sophranitis grandiflora* (t. 3), of which the two forms—that with the longer leaf and brighter flower, and that with the shorter leaf and darker flower—both well-known to cultivators, are beautifully represented. The distinctive titles of *S. grandiflora* and *S. coccinea* are sometimes given to these two forms; and Mr. Warner adds:—"There are several other varieties, but those figured are amongst the best we have seen." The fact begins to be appreciated that Orchids, like other plants, are propagated by seed when in the wild state, and that consequently a certain amount of variation—less or more, often more than less—will certainly appear amongst the imported plants.

Der Obstbau im Deutschen Reiche und der Ausfall der Obsternte im Jahre 1876. Von Dr. Karl Koch. (Fruit Culture in the German Empire and the Fruit Crops of the Year 1876.) Berlin, 1877.

We have received a reprint of this report, which originally appeared in the *Monatshfte zur Statistik des Deutschen Reiches*. It is much more complete than any of the preceding reports, conjointly drawn up by Dr. Koch and Dr. Lucas, the well-known pomologists. This is due to the much fuller information received from the appointed local reporters in various districts. Some idea of its extent may be gathered from the fact that it occupies forty-four closely-printed quarto pages. It is issued by the Imperial Statistical Office for the purpose of promoting fruit culture generally, and the selection of the best varieties in particular. Nearly thirty pages are taken up with the reports furnished from twenty-seven different provinces, duchies, &c., most of which are represented by several districts. These reports relate to the condition of fruit culture in the several districts, and the prospects of the fruit crops. Following them is a summary of the principal features of the meteorological observations taken at various meteorological stations, and the latter part is devoted to the consideration of the crops actually obtained of different varieties of diverse fruits, with some statistics relating to exports, &c. As there is no general summary, we

are obliged to content ourselves with calling attention to this valuable and interesting account of fruit culture in Germany. Any one interested in this particular question will find in it an immense amount of curious and instructive information.

BOOKS RECEIVED.—Scotch Live Stock, by James Bruce (Hamilton, Adams & Co.).—The Colorado Beetle, by Charles V. Riley, M.A., Ph.D. (Routledge & Sons).—The Colorado Beetle, by Dr. Andrew Wilson (W. & A. K. Johnston).

Foreign Correspondence.

CARROLL CITY, IOWA: *The Colorado Beetle.*—I have been much interested in reading several articles in your late numbers on the Colorado beetle (commonly called here in America the Potato bug). I have had to contend with them for the past eight years, and can give a little practical experience on them. About seven years ago they first made their appearance at Hamilton, Ontario, Canada, in some numbers, and were shown as specimens of some strange beetle. The next year they appeared quite numerous, and we had to adopt measures to destroy them; some tried hand-picking, others used Paris-green in different ways. Some mixed 1 lb. of Paris-green to 14 lb. of fine shorts, others the same quantity of fine ashes or plaster. It must be very carefully mixed. We then took it to the field or garden at early morning. A calm morning should be selected, and while the dew is on the Potato tops. We then dusted the mixture over the foliage; the beetles in eating the leaf partake also of the poison, and in a short time they died. Some mix the Paris-green with water, just sufficient to give the water a green tint, and water with a fine water-can. The beetle will also feed on and destroy Tomatos and Egg-plants after they have destroyed the Potatos, and will eat out any Potatos that appear to be above-ground and the fruit of the Tomato.

During the past year I removed from Canada to this western part of Iowa, some 866 miles west, and here we have the beetle in large numbers. We use the same means to destroy them as in Canada, and find it always effectual when done in time, and we save our Potato crops. There should be some means used as soon as the beetles appear to destroy them, and prevent them from laying their eggs, as they increase very fast if not prevented.

We do not trouble about the Colorado beetle, as we can master them with Paris-green; but we have at the present time an enemy which we cannot keep under. I speak of the grasshoppers, which have paid us a visit and destroyed all our garden crops, excepting the green Peas, which they do not appear to like. No doubt Paris-green would destroy them, but then it could not be used on many vegetables, as it is a poison, and requires great care in its use. The great drawback to this fine country is the grasshoppers, and no remedy that I know can hold them in check, excepting the Power which controls the winds, and says to the troubled sea, Peace! be still.

I should feel it a favour if any of your readers could give us a remedy for the grasshoppers through the *Gardener's Chronicle*. J. Rootz.

Forestry.

My last article related to diseases incidental to the roots or underground part of forest trees, while the present is designed to point out some of those diseases to which the stem and branches, but particularly the leaves, are most liable. The seat and root of disease, whether in the human body, the lower animal, or vegetable product, is often very remote, secret, and difficult to discover—so much so, indeed, that the effect is often mistaken for the cause, and the skin and foliage treated for diseases which lie, not on the surface, but in the interior—not in the skin and foliage, but in the stomach and roots.

Every species of tree is liable to some form of disease or accident from which others are more or less exempt; and, so far as is known, any species of tree is liable to one or other of the many diseases or accidents common to the vegetable kingdom; so that in plain language there is no tree perfect, and probably not a leaf upon the fairest and best but is found full of blemishes, blotches, eruptions, defects or excesses. Without, however, entering the dark, deep, and obscure part of the subject, we shall find material

enough for the present in what lies upon the surface, and is spread out before us. Plants, like animals, are never wholly and entirely at rest, for while one set of organs is in repose another is busy and active. The Larch tree in mid-winter (being deciduous) enjoys a kind of rest, which the Scots Pine (an evergreen) is a stranger to. It is very evident that the foliage of the Scots Pine and other evergreen forest trees grow and develop long after the Larch and other deciduous trees have shed theirs, and are thus far gone to rest. I have said "thus far" because it does not follow that since the leaves have fallen off and are gone, that the sap and gases of the tree have ceased to operate actively. On the contrary, the sap appears never to be at rest; and the changes of temperature, whether in soil or atmosphere, instantly influence the vital parts of the tree, and set them in motion. If we cut a branch off a deciduous tree in winter, as the Birch and Sycamore, the watery sap immediately flows from the wound, while if cut from a Pine or Fir tree the sap in like manner rises in the form of resin.

It is, however, with the abnormal rather than the normal state of the plant that we have at present to do. The only part of a tree that really and truly suffers above-ground is the leaves or foliage. By a wise Providence the embryo leaves are all tenderly, carefully, and securely compressed and folded up within the scales, which in point of fact are also just leaves, of a kind and quality fitted for the hardships they have to endure in protecting the soft and tender leaves in their bosom.

The season of the year, and manner in which the buds open, the scales fall off, and the leaves expand, all contribute greatly towards the healthy and profitable future crop. For a climate like ours, the most suitable tree is that which is late in foliating, early in defoliating, and grows rapidly in the interval, of which the common Ash and Beech are specimens. The Beech tree also retains its old leaves till the young ones displace them by the bud expanding. True we have now and then a gale or summer storm off the sea, that blights and blasts both the Ash and Beech tree; this, however, is but rare, and the singular occurrences would by no means warrant us in making provision for them even if we could. Any damage done to the foliage of a tree, whether evergreen or deciduous, in summer or winter, just so far damages the tree on which it is situated.

The leaves perform a very important part in the economy of the tree's growth—they are probably to the plant much what the lungs and digestive organs are to the animal, namely, the laboratory in which everything requisite for building up the body is prepared.

Mildew is a leaf disease both common and hurtful, and moreover one that little or nothing can be done to cure. The Larch is often seriously affected by it, and I have observed that it is always worst in damp, confined places. Trees, however, that are affected by it one year are frequently clear another—more evidently depending upon the state of the weather and atmosphere than upon soil or situation. The most effective means of preventing mildew on Larch is to thin well, and admit abundance of air and light.

Various descriptions of insects attack the foliage of trees occasionally, such as the *Coccus laneus*, the great enemy of the Larch, which usually accompanies mildew. The same trees are not successively infested with it, but, on the contrary, the localities that are worst in a dry season are least affected in a wet one, and *vice versa*. Trees amongst Whins, too, are in dry seasons usually covered with it, while in wet ones none of it appears. Any stagnation of growth is at once the signal for an attack of insects, mildew, or other malady, whether occasioned by superabundance of moisture or deficiency of it.

The Scots Pine, no less than the Larch, is liable to attack by its own peculiar natural enemies, of which there are several. The *Hylurgus piniperda*, or Pine beetle, is a serious one. Its ravages are committed, not upon the foliage but upon the young shoots, which it destroys by eating the pith out of them, thereby entirely destroying the shoot whether of subsidiary branches or principal leading shoot. It comes and goes, no one knowing whither, and rarely attacks the same parts of a plantation successively. It has no doubt done harm, but as yet, so far as I have seen, nothing very serious or alarming.

The Pine-leaf caterpillar, *Bombix Pini*, is also an enemy of a somewhat formidable character. It rests in dense clusters upon such trees as it attacks, and the

insects do not, as in the case of most other caterpillars, spread over the whole tree or extend to others. From first to last, as far as I have seen, it remains congregated, and devours every leaf close in to the bark, and sometimes beyond it, till nothing green remains, and it is only because the buds remain uninjured that the vitality of the tree is preserved. I have searched for, but found no traces of it the succeeding year, which is a source of congratulation.

Squirrels are also very destructive to the Scots Pine, but they can easily be kept in subjection by the gun, hence need not be any source of alarm. Trees injured by insects, quadrupeds, birds, &c., come rather under the category of accidents than diseases; hence it would be well if some more definite terms were made use of to distinguish them than at present exist. *C. Y. Michie, Cullen House, August 27.*

Natural History.

THE CUCKOO.—Like your correspondent, Mr. Reed (p. 238), I was much interested in the fate of a young cuckoo during the early part of August. Cuckoos have been very numerous in this neighbourhood during the present summer, and, to use a Norfolk phrase, we have been "crazed out" with their repeated cries of "cuckoo" from early morn till dewy eve. One of the standing orders in this garden is that no bird's nest is to be destroyed or molested, and I attribute the frequent recurrence of the cuckoos around us to the multiplicity of small bird's eggs. Our gardens and grounds, being surrounded with shrubberies and plantations, afford shelter and protection to hosts of the feathered tribe. As a consequence of this I may say that we cannot ensure a single ripe fruit of any of the so-called small fruits, unless we net them up. The cuckoo is everywhere—at least in England—known as a bird exceedingly fond of sucking other birds eggs, and to this may be also attributed their capability of producing such a shrill sound, and so very articulate as well. This power they lose towards the end of July, when eggs become scarce, and it is somewhat pitiful to hear them struggling through hoarseness to repeat their wonted sound. It is premised that when eggs become scarce here they leave for some other country where they are more plentiful. In a Laurel bush, growing close to a much-used walk, and close to the end of one of the greenhouses here, a water-wagtail reared a young cuckoo during the present summer. Both the parents evinced the greatest care and watchfulness over the cuckoo by keeping near to it, hopping from branch to branch, and often flying to it with something in their mouths if no one was near. Some of the men found it when it was nearly full grown, and did not mention the circumstance to me until August 6. Whether the water-wagtails had a brood of their own in the nest or not we are unable to say, but they were positively the foster-parents of the young cuckoo. A few days after I was made acquainted with it, I was standing in the walk looking at it, when it left the nest and got into one of the trees near, and as it gained strength got farther away, but we could hear it call, and also see the water-wagtails flying around it. Eventually it went right away, and the wagtails also have gone. I never before knew that these birds built their nests in shrubs. *Thomas Wynne, Hemsby Hall, Norfolk.*

THE ROSELESS AUTUMN.

Do Flora and Pomona run in pairs? It seems like it. No fruit, few or no Roses this autumn. Here, however, this analogy ends, for seldom has there been a fuller crop of Roses than this July. They were later than usual, but they made up for their lateness by their brilliancy and numbers. Then the bushes and trees were all Roses, and, writing broadly, there have been none since. Most of the perpetual Roses have proved mere summer ones this season—they have flowered once, and then gone quietly to rest, forgetful alike of their character and the season. We have lately looked through some considerable collections of Roses, and could easily have counted all the so-called perpetual Roses in flower on our ten fingers. In fact, but for Teas, Noisettes, and such Roses as La France and Boule de Nègre, not a few gardens would have been wholly Roseless from the middle of July till the end of August or later. The old Gloire de Dijon, the beautiful and most useful Céline Forestier, the pink Gloire de Dijon, Gloire de Bordeaux, Triomphe de Rennes, Devoniensis, Souvenir de la Malmaison, Homer and Saffrano, have been among the finest Roses this autumn.

How comes it that so few of the others have flowered

a second time as yet, and give no sign of flowering any more at all? The causes are probably very similar to those that brought about the general failure of fruit—a mild winter, a late and severe spring. Not a few Roses scarcely rested from growing all winter. Mild open wet weather kept roots and tops in a state of abnormal activity. The early months of the year also continued mild. The Roses started early into growth, or rather they never left off growing, and at one time it appeared as if we might have reaped a sweet harvest of Roses in April instead of June. Thousands of fine buds were cut off in March by the late pruners. The plants broke afresh, and growth proceeded cheerily as marriage bells, until May with its stinging frosts arrested, and in a few instances killed, the young wood. As a rule, however, the cold weather in May, with the drought succeeding it, merely put back the season of flowering, and made the Rose harvest later than usual by nearly a month. In this late pruning and late flowering may probably be found the whole secret of the scant bloom of Roses this autumn.

Absolutely the Roses were not perhaps pruned much later than usual, but it was later relatively in regard to their condition. More growth was made before pruning than usual, consequently more was cut away, and there was a greater, larger sacrifice of growing force and vital energy. In some cases this loss, and the debility resulting from it, told sensibly on the first bloom—the flowers were smaller, had less substance, were not so brilliant as usual. The foliage, too, was in many cases smaller, and in all, perhaps, less plentiful than in average seasons. But upon the whole most Roses got through the first flowering period creditably; but the first flowers seemed to expend all their vital force—use up, as it were, their growing energy. Hence, when the season came to break again into a second crop of wood and flowers the Roses seemed deaf to the customary cry, and remained dormant. Possibly the abnormal amount of wood made and buds put forth before pruning this spring may have a good deal to do with the flowerless Roses of this autumn.

The plants may have thought that early show their first Rose harvest; if so, the July bloom would be their second, and as they seldom yield three a year, the Roses might naturally conclude their working season ended, and go to sleep soundly throughout the autumn and early winter months. Be this as it may, of the fact that there are few Roses this autumn no one can doubt. It is one of the most marked peculiarities of this peculiarly trying horticultural season. Neither, as far as the Roses are concerned, do the difficulties and dangers end with the scarcity or lack of second flowers. The plants, especially should a wet autumn set in, will be sure to make a late growth; relieved, in fact, from bearing their usual second crop of flowers, they will be almost sure to take to the making of unseasonable wood. Growth out of season, again, means weakness—injury from winter's frost, enfeeblement, disease, and death, and imperfect blooms in 1878. Perhaps the best mode of treating late-growing Roses this autumn would be to root-prune them somewhat severely, or to take them up altogether and replant them next November. Careful transplantation arrests late growth, reduces its amount, and retards the start in the spring, all of which will prove favourable to a rich and full Rose harvest next June. By thus getting the bloom back to its normal time, and re-establishing the health of the plants, the probability is that the Roses may be got into flowering a second time next autumn with their usual profusion and perfection. *D. T. Fish.*

RHODANTHE MANGLESII.

THE delicate colouring and exquisite beauty of habit of the old Rhodanthe Manglesii renders it a general favourite as a bedding plant during the summer months, but, charming as it is outdoors at that season, it is much more so in early spring when grown in pots and used for decorating greenhouses or conservatories, for which purpose it is one of the most valuable and effective things that can be had, especially if the plants can be stood on shelves or other elevated positions, about on a level with the eye, as then they show off their gracefully drooping flowers to great advantage. To have them in good condition by April or May, seed should be sown at once in some light rich sandy soil and placed in any close moist frame, where, if shaded from the sun, it will soon germinate. The proper way to treat these and all other small seeds of light character, is to fill as many pots or pans as may be required, and having pressed the soil moderately firm and made it perfectly level, then to give a gentle watering through a fine rose, and allow them to stand a few hours before sowing; after which a little dusty peat or loam should be sprinkled over the top. So treated the soil remains in a uniform state of moisture for a considerable length of time, which is a great point in raising plants from small delicate seeds. If this were more attended to nurserymen would escape much blame,

as there would be but few failures in getting them up. It is the constant stopping or sudden alternations between wet and dry that are fatal to success, the one causing the seed to rot, and the other the tender germs to perish just as they emerge through the cuticle. A sheet of glass or a piece of brown paper, or both, laid over the pots or pans for the first day or two, is of great assistance in intercepting evaporation, but when these are used much watchfulness must be exercised, so as to have them removed the moment the plants appear, or they will be drawn up and spoiled.

In the management of Rhodanthes sown at this season, they should be potted off in 4-inch pots as soon as large enough to handle, placing from three to five in each, according to the purpose for which they may be required and the size of the specimens desired. If placed for a few days in any close moist frame, where they can be afforded a slight shade, they will soon get a start, after which a light airy shelf in a warm pit or intermediate house is the best situation in which to winter them, as there they remain free from damp and continue their growth in a regular and uniform manner. At the turn of the year they will be in a sufficiently advanced state to receive their final shift into 6 or 8-inch pots, in either of which sizes they may be grown from a foot to 18 inches in diameter, and plants such as these when in bloom form striking objects that will last a considerable length of time in great beauty.

To have the plants in this state of perfection they must be grown on without check from the first, otherwise they get into a stunted condition, and when this occurs it is a difficult matter to induce them to start away freely again, on account of the tendency they have to produce flowers after their progress has been interrupted from any cause, and more especially in this the case when under pot culture. It is therefore necessary to render them all the assistance possible by affording liberal treatment in increasing the temperature as the days lengthen, and keeping them well syringed once or twice a day, according to the state of the weather, besides continually maintaining a moist genial atmosphere to keep them free from red-spider, an insect to which they are rather subject, as also greenfly, which will soon cripple the leaves unless destroyed by timely fumigation. As the pots fill with roots liquid manure will be found of great benefit, but this should be well diluted, as it is better to administer it often than to give it strong at any one time, as is frequently the case. Soot-water in a thoroughly clarified state, or the drainings from cow or sheep droppings, or the two mixed, is the most suitable for pot plants as being cooler in their nature and altogether more mild than any of the artificial compounds, all of which require using with great care and judgment.

The soil which is best adapted for growing Rhodanthes is a mixture of turfy loam and peat, or well decomposed leaf-mould and the former in about equal proportions, to which should be added a sprinkling of silver-sand to keep it open and porous. Besides *R. Manglesii* there are several very desirable varieties, especially the white, which should be grown for the sake of the rich contrast its pure satiny flowers afford. *J. S.*

Garden Operations.

PLANT HOUSES.

GREENHOUSE HARD-WOODED PLANTS.—Those who grow the unapproachable coloured *Pleroma elegans* for decorative purposes will be in possession of one of the most useful autumn-flowering plants for conservatory display existant. The individual flowers do not last very long, but where the plant is well managed they are produced in continuous succession for a month; but, like some others of the very finest blooming plants we possess, the colour is extremely sensitive, and is completely destroyed if subjected to much light, and as little or no leaf growth is being made whilst blooming, it should during this time be stood in a position where it will be well shaded. Swainsonas are not nearly so generally grown as they deserve to be; for conservatory decoration at this time of the year their bright-coloured, cheerful-looking flowers afford a pleasing contrast to the never-changing sameness resulting from the use of the quantities of *Fuchsias* and *Zonal Pelargoniums* that now often preponderate over everything else in greenhouses and conservatories. *S. galegiolia*, *S. Osbornii*, and *S. Rollisnori*, are all worth a place. The principal thing is to keep them clear from red-spider, which, from the character of the leaves, is a very easy matter, providing enough water is applied overhead. Not only should the syringe be used freely once a week during the growing season, but also through the present month, and so long as they remain in bloom; it will not injure the flowers unless applied too forcibly. For home decoration there is no need to expend much labour in training these plants, half a dozen sticks inserted just inside the rim of the pots round which to

loosely wind the shoots will be found sufficient. *Tetralæa verticillata* is another easily managed, almost continuous-flowering plant of moderate growth; its distinct, non-formal habit and equally distinct freely produced flowers alike fit it for standing in front of larger subjects in the greenhouse and conservatory. Plants that were slightly cut back after the spring blooming will again now be in full flower and continue for some weeks; if placed in a conservatory they should have a light situation.

Phenacoma prolifera.—Plants that set their blooms late will for some time yet be fresh and effective, but when employed for conservatory decoration care must be taken that the flowers are not wetted should the syringe be used, or they will at once turn mouldy. Croweas will now be fast coming into bloom, and will keep on if well managed almost to the end of the year: they are somewhat subject to scale, and before the flowers open the insects should be removed by sponging, or else they soon get the leaves into such a dirty condition as to mar the appearance of the plants. The yellow flowered *Cassia corymbosa* will, from the uncommon colour of its blooms amongst hard-wooded plants, and its long continued flowering, be a useful addition to the conservatory; whilst here it will bear standing in positions where it will receive less light than most things. *Desfontainea spinosa*, grown in pots, and that has been exposed in the open air through the season, will now begin to open its attractive pendent, long-enduring flowers. It likewise, for many weeks, may be stood close to, or under, other larger glowing subjects. The red-flowered *Leschenaultia formosa* and *L. intermedia* are amongst the most useful small plants that can be used for standing on brackets, or anywhere near the front of conservatories, yet how seldom do we now see them. They keep on blooming incessantly almost the whole year round. There are few things more easily grown. The principal matter to attend to is not to let them get affected with greenfly, to which they are somewhat liable, and on them it attains so small a size as to often escape detection. Where *Witsenia corymbosa* is grown into moderate sized specimens, its exquisite blue flowers will now be produced in succession for many weeks; this plant also bears a confined situation without suffering much injury whilst it is blooming. The above are a few hard-wooded plants that give variety for conservatory decoration during the autumn months, yet in the too general disposition evinced now to use a preponderance of ornamental leaved subjects with few flowering things to assist them except the easiest grown soft-wooded plants, there are numbers of the most deserving old favourites lost sight of. The want of variety in the species of plants now generally met with through the autumn months in greenhouses and conservatories rob these structures of one-half the interest that would be attached to them were greater variety employed.

Mandevilla suaveolens.—Where this most useful and fragrant climber is grown it will either now be in flower or shortly begin to open; the reason why it does not succeed with many people is through its leaves becoming a prey to red-spider, to which it is more subject than many things; nevertheless from its distinct and beautiful character it should not be discarded on this account, as if well washed with the engine or syringe once a week it can be kept perfectly clean. It forms a charming contrast to *Lapageria rosea*, and where it has attained sufficient strength will keep on blooming till the middle of October or later. The use of the syringe should be continued whilst in flower so long as there is solar heat enough to give vitality to the insects.

HEATHS.—Any plants of these that have deficient root-room should at once be potted. The principal advantage derivable from moving Heaths at this time in preference to the summer immediately after blooming, is that they are much less likely to suffer from the effects of the operation than when it is carried out whilst the weather is hot; this is more especially the case when the balls of the plants are very full of roots, and consequently have become matted to a considerable extent against the sides of the pots. Do not by any means disturb the roots further than removing the drainage from the bottom, and ram the new soil so as to make it thoroughly solid. When the potting is completed at once place them in a pit, or house, where they can be kept a little close for two or three weeks, but if the operation is carefully performed there will be no occasion for shading unless the weather is more than usually bright, as from the moist condition of the air in most parts of the country, consequent upon the recent more than ordinary rainfall we have had, they will not suffer as during a drier time. *T. Baines.*

FRUIT HOUSES.

PINES.—The advent of the autumnal months, with the concurrent atmospheric changes which naturally arise, will necessarily entail more diligence in the way of airing the plants in this department, and not only so, but more foresight will also be needful towards sustaining with regularity a proper degree of heat in

the houses when that arising from natural sources is defective. In the case of this particular section of plants, at this season, the greater part of them will be in a very active state of growth and full of vigour. Under such circumstances every proper means should be taken advantage of to harden and consolidate it before the short dull days of winter arrive, and particular care should be exercised so as to avoid extreme variability of temperature in the houses, as this is in general somewhat detrimental to the plants, and particularly so with regard to those which are not wanted to show fruit yet, its effects oftentimes resulting in starting the fruit prematurely. Every care should consequently be given to this matter, especially in relation to plants of the Queen variety, as if this section start into fruit at this period of the year it is disastrous, inasmuch as they are not suitable for the purpose, and, moreover, in point of quality at the time they would ripen would not be at all comparable to other more suitable kinds for that purpose at that period. Assuming that at an early date all the fruiting plants will be brought together where they can have a good supply of heat and plenty of sunshine when it exists, with a corresponding amount of moisture supplied about the house to keep its temperature genial and invigorating— at 75° daily, by fire-heat 90° at the roots, 80° to 90° by sunshine, with air on the house, and 70° at night—remove all the suckers from the plants before they get large, save one for stock, and keep the fruit free from moisture during the flowering process. The set of plants which is intended to succeed the foregoing should consist for the most part of the Queen variety, as this sort is eminently suitable for the purpose. These plants should receive careful treatment during the period of rest, which should terminate about the middle of November next. For the present about 68° at night as a mean should rule, with 5° more daily if required by fire-heat, and 80° at the roots constantly. Open the house slightly at from 75° to 80°, and freely ventilate at the latter degree, closing up the house finally for the day at 76°. If during very fine weather the axils of the leaves become dry give a slight sprinkling overhead with the syringe, but avoid having a superabundance of moisture constantly in the house. In the case of later plants which are to be kept growing on for another month or six weeks, a temperature slightly in advance of the preceding temperatures should be permitted with an increased amount of moisture in the house, and those plants which are to be wintered in 7 or 8-inch pots need only be slowly advanced. *G. T. Miles, Wycombe Abbey.*

ORCHARD HOUSE.—All the early and midseason Peaches and Nectarines from which the fruit has been gathered, may be removed to the open air. If infested with any kind of insects let them be thoroughly cleansed at once, and afterwards keep the foliage clean by means of the syringe or garden engine on fine evenings. Early in September, when the foliage shows signs of ripening, the roots should be examined, and if rotting is necessary the operation may be performed without delay. Guard against large shifts, as medium-sized pots well filled with roots always give the best crops of fruit. Trees in pots sufficiently large may have a large portion of the old soil removed, the roots shortened back, and be returned to clean pots of the size they now occupy. In potting fruit trees, perfect drainage must be secured. Strong turfy loam from the limestone, with a liberal admixture of burnt earth, or old mortar and bone-dust, will form a suitable compost; use it in a dry state, and ram firmly into the pots, as for Melons. Give sufficient water to encourage the formation of new roots, and expose the pots to the genial influence of autumn sunshine. Having disposed of the early batch, a rearrangement of the house will be necessary and beneficial to the late kinds, which may be set out thinner. Remove all young growths, and turn aside old leaves which in any way interfere with the colouring of the fruit, and secure ripe wood for another season by keeping the trees under glass until the leaves fall. Encourage Figs now ripening with heat, liberal ventilation, and full exposure of the fruit to the sun. Guard against atmospheric moisture, but give liberal supplies of moisture to the roots. Examine Cherries which have been some time out-of-doors, and providing they do not require larger pots see that the drainage is perfect. Remove a portion of the surface soil well down the inside of the pots, and topdress with loam and bone-dust.

CUCUMBERS.—The wet, sunless weather has been against free, firm growth, and plants raised from cuttings or seeds in the early part of August will be somewhat later than usual, and liable to flag under bright sunshine; where this is the case a very slight shade may be laid on for a short time, until the foliage becomes stronger. Train straight up the trellis, remove all male blossoms, and defer stopping the points until three-fourths of the allotted space has been filled. Autumn-fruiting plants will require less shade and moisture as days decrease in length; the young growths should also be kept thinner, and if all surplus or ill-placed fruit are removed the bearing period may be greatly extended. Make another sow-

ing for giving a supply of fruit from Christmas onwards, and make the last sowing about the second week in this month for carrying on into the spring. Where the houses are divided into compartments the raising of young plants should be regulated by the dates on which existing crops of Melons or summer Cucumbers are likely to be exhausted, young plants being always preferable to those which have become pot-bound. Push on the cleansing and painting as the pits are cleared, in order that there may be no delay when the time for planting arrives. If fermenting material is used for bottom-heat, no time should be lost in getting together a supply of Oak leaves and horse-dung, or, failing this, Oak bark, which, having been prepared by fermenting and turning in a dry, open shed, may be used as a good substitute. *W. Coleman, Eastnor Castle.*

KITCHEN GARDEN.

The late rains have proved very acceptable in this part of the country, where we were beginning to suffer from the effects of long drought; and where the necessary plantations of the various crops have been persistently carried out they will now grow away vigorously. Before they become too large it will be necessary to stir the soil deeply, and draw the earth up to the stems of any of the Brassica family requiring it. Buda Kale and Coleworts for spring may still be planted, but no time must be lost. A large breadth of the various sorts of Endive before recommended should now be got out at once; this will form the main supply for autumn and early winter purposes and for storing, but unless a very severe winter sets in a plantation made later on, in ground not too richly manured, will be found better adapted for winter use; but the ground for the present and largest plantation may be very liberally manured, in order to induce a free and constant growth. A large breadth of the various Lettuces should also be planted out at once, and encouraged by liberal treatment. The Old Bath Brown Cos should enter largely into this crop, as it is the best for taking up and storing for winter use. Plants intended to stand through the winter should be left a while longer, but it is a good plan now to make a sowing on a warm sheltered border to stand through the winter for planting out in the spring. For this purpose the bed should be larger than usual, and the seed thinly scattered; or if necessary they must be thinned out in good time, as the object is to secure a good short stocky growth of plant; the Bath Cos and hardy green Cos are good sorts for this sowing. The tying of Endive and Lettuce for blanching will require attention, as it must only be performed when the plants are perfectly dry; in catching weather this is sometimes neglected, and the result is a mass of putrescence inside when they come to be cut for use.

Onions should now be ready for harvesting; they should be taken to the store-room when perfectly dry, but as the ground will be wanted at once if the Onions are not ready they may be laid out in open sheds for a few days, and then stored. The ground should be cleared of rubbish, liberally manured, and trenched up two spits deep in readiness for Cabbages to stand through the winter. This in most cases is an important crop, and will require extra care in the manipulation. Let the ground remain roughly thrown up for a few days, then break it down level, and plant at 20 inches each way. This is quite near enough for the winter sorts; summer sorts may be planted nearer, as they are off and gone as soon as ready, and many plant the winter crop double thick and pull out every other plant for greens in the spring, but this practice is "more honoured in the breach than in the observance," as the greens are but poor things at the best, and the ground ought not to be robbed when succulent and tender-hearted Cabbages are required and appreciated. After selecting all the best plants for the bed the remainder should be lifted, and pricked out rather closely in beds for stores to fill vacancies, and for early planting in spring. At the same time a bed should be sown soon to supplement them: these must remain in the seed-bed all the winter. Spinach beds for winter will now be ready for thinning out, which should be done before the plants get drawn. If the ground is good, and the plants likely to grow strong, from 10 inches to a foot is not too much to allow the plants. The earthing-up of Cardoons and Celery must now be diligently followed up in perfectly dry weather. At the same time plentiful applications of water and liquid manure must not be forgotten. This should not be poured down the centre of the ridges over the plants, but into the small trenches outside of the ridge. Turnip Radishes should now be sown every fortnight for two months. If a bed for very late Turnips is not sown not a day should be lost, and advancing crops of these should be constantly thinned out as soon as ready, and the ground stirred amongst them. Thin out autumn-sown Carrots as soon as ready. Nothing weakens plants which have to stand the winter so much as leaving them drawn up weakly in the seed-bed. The only remedy is to thin in time. *John Cox, Redcar.*

THE

Gardeners' Chronicle.

SATURDAY, SEPTEMBER 1, 1877.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY,	Sept. 3	— Sale of Dutch Bulbs at Stevens' Rooms.
		Royal Horticultural Society: Meeting of the Fruit and Floral Committees at 11 A.M.; General Meeting at 3 P.M.
TUESDAY,	Sept. 4	— Kennington Amateur Horticultural Society's Show (two days).
		Glasgow and West of Scotland Horticultural Society's Autumn Show.
WEDNESDAY,	Sept. 5	— Sale of Dutch Bulbs at Stevens' Rooms.
		Carlisle International Horticultural Exhibition (three days).
THURSDAY,	Sept. 6	— Sale of Imported Orchids at Stevens' Rooms (two days).
SATURDAY,	Sept. 8	— Sale of Dutch Bulbs at Stevens' Rooms.

THE reappearance of the CULFORD VINE SPORT—or, as it has facetiously been termed, the Culford apparition—induces us to advert once more to the subject. When it was formerly under discussion we laboured under the disadvantage of not having ourselves seen the sportive Vine, and we could only discuss the matter on general principles, and reason from the analogy afforded by other and not infrequent examples of a similar, or supposed similar, character. Lately, however, we had an opportunity of inspecting this now famous Vine, of comparing it with other rods of Trebbiano and Golden Champion growing in the same and in different houses; and lastly, thanks to Mr. GRIEVE, we have had the opportunity of carefully comparing the foliage and berries of the sport with those of the Vines just mentioned. We have thus been enabled to arrive at some conclusions, which we propose to lay before our readers, but in no dogmatic or *ex cathedra* spirit. The facts observed admit of more than one interpretation; and, although we have our own views as to which is the more probable, yet so little is definitely and precisely known as to the causes of these phenomena, that we are quite disposed to consider the matter as an open question.

The history of the sport in question is now pretty widely known to Grape growers. It has been given and discussed in several of the gardening periodicals, and only a short time since Mr. GRIEVE briefly recapitulated in our own columns the history of the appearances presented (see *Gardeners' Chronicle*, August 18, 1877, p. 213, fig. 46). It is therefore not necessary to dwell on this part of the subject. We propose to confine ourselves to a brief mention of what we ourselves observed on a personal inspection of the Vine in question a few days since, to the results of the comparison we were enabled to make on the spot between the several Vines named, and of the examination of the materials we were allowed by Mr. GRIEVE to bring away with us. Without going into needless minutiae it may suffice to say that the parent rod of the Trebbiano from which the sport which has given rise to this discussion emerges is trained in the usual way under the glass of a lean-to vinery, and that about the middle of its length it gives off three fruit-bearing spurs which we shall have to refer to specially. Below these three on either side of the rod are borne some six or eight bunches of Trebbiano, about three parts ripe at the time of our visit.

It is then to three special shoots or spurs that we desire to draw attention. The lowermost of the three is the original one which in the year 1874 bore the bunch of Golden Champion, or one which was so like Golden Champion as to be taken for it by experienced Grape growers and amateurs, of whose good faith and competence not a shadow of doubt can possibly be entertained. The base of this spur still bears the label which, as we were informed, was attached to it by Dr. HOGG on the occasion of his visit. At the present time this shoot bears leaves which are indistinguishable

from those of Trebbiano, but the bunch and its constituent berries, in form, in size, in stage of maturity, in tendency to spot, are unquestionably much more like those of true Golden Champion, growing close by in the same house, than they are those of the Trebbiano produced on the same rod, even when all due allowance is made, as it should be, for variation in individual berries. Incidentally, it may be remarked that the individual berries of Golden Champion exhibit a considerable range of variation. The bunch in question, as we learn from Mr. GRIEVE, measures 10 inches across the shoulders and 10 inches in length, exclusive of the stalk. The berries, at the time of our visit, were not quite ripe, and had not yet the pale amber tint of other Golden Champions in the same house. This may to some extent be attributed to the circumstance that the sport occupies a more shaded position than the fruit of the Champion rod, which grows close to the light at one end of the house. We may assume, however, that the general appearance of the sport is much the same as it was in 1874; indeed, such is the testimony of Mr. GRIEVE himself, and of others who have seen it in both years.

Next we come to the middle bunch of the three to which we desire to call attention. This is borne on the same side of the main rod, and on the next spur but one above the first mentioned. The leaves on this spur are in all essentials like those of Trebbiano and not those of the Golden Champion. The bunch measures 9 inches across the shoulder, and is 8 inches long, and its constituent berries, as compared with those of adjacent Trebbiano and Golden Champion respectively, are distinctly intermediate in character. They are smaller than Golden Champion and larger than Trebbiano, and in all ways appear to hold a middle position between the two. It may be mentioned that the largest bunch of Trebbiano proper measures 7 inches across the shoulder by 12 inches in length. We look upon the production of this intermediate bunch as a most important link in the evidence, though somewhat singularly Mr. GRIEVE made no mention of it in his last letter, and we presume a similar one was not produced on former occasions.

The third or topmost bunch on the same side as the two before mentioned hardly deserves notice, except for the fact that the terminal berry is more like one of Golden Champion than of the Trebbiano. On the other hand, it must be borne in mind that the terminal berry of the bunch is very often larger and of a different shape from the rest, the difference frequently being consequent upon a fusion or growing together, Siamese-twin fashion, of two or more berries. This did not appear to be the case in the bunch under consideration, whose terminal berry seemed to have, as we have said, a good deal of the Golden Champion character, and will probably develop still more in this direction as it ripens. We think, then, that we are justified in stating that this third bunch presents, like the two lower ones next adjacent to it, but to a much smaller extent, the characteristics of Golden Champion.

Speaking, therefore, in general terms of the Vine in its present state, it may be stated, 1st, that the foliage on all three of these spurs is indistinguishable from that of Trebbiano (except in one minor point to be hereafter mentioned); 2d, that the bunch of the lowermost spur resembles that of Golden Champion very closely, indeed so much so that, were it not that the berries are not so mature as those on the Golden Champion adjoining, we should have had no hesitation in pronouncing them identical; 3d, that the middle bunch of the three is intermediate between Trebbiano and Golden Champion; and, 4th, that the third bunch, while almost entirely of Trebbiano character, has its terminal berry of a different

shape and size to the rest, and in this point resembles Golden Champion.

We have now to mention some points of distinction between the foliage of Golden Champion and that of Trebbiano. Of course a large allowance must be made for variations in size, colour, hairiness, &c., according to the position of the leaves on the rod, and other circumstances so familiar that we need not take up time by further alluding to them. Setting aside these variations, there appear to us from the comparisons we have been enabled to make, two special points in which a difference is clearly observable between the foliage of Trebbiano and Golden Champion. In Golden Champion, as a rule, the leaf-stalk is rather shorter in proportion to the leaf-blade than it is in Trebbiano, and the lobes of the leaf, as well as the smaller toothings of the margin, are narrower and more sharply pointed in the Champion than they are in Trebbiano. In other words, the teeth of the leaf in the Champion are deltoid Δ or triangular, with nearly straight sides, while in the Trebbiano the teeth are broader and with curved sides, so that they have an egg-shaped, pointed outline. As we have said, the leaves on the sporting spurs appear to us—regard being paid to individual variation—to be precisely those of Trebbiano, with the minor exception that in the relative length of the leaf-stalk and of the blade they approximate more nearly to the character presented by the Champion. As to the bunches and berries, speaking now entirely from those to be seen in the same house at Culford, we may say that Golden Champion, as compared with Trebbiano, has larger bunches with wider shoulders, the individual berries are also larger, have stouter foot-stalks, ripen earlier, are more amber-coloured, and have the constitutional peculiarity of spotting.

We are quite well aware how wide a margin must be left for natural variation according to circumstances. The variation in size and form of Grapes in the same bunch is, of course, a matter of very frequent observation. We can also quite well understand how even an expert may be deceived in certain cases by an unusually fine or an unusually poor condition of a particular Vine, and so be led to identify it wrongly; but that is a very different case to the production of one or more sports on a rod bearing several normal bunches.

The conclusions that we have arrived at, therefore, are that the Culford sport—we may now say sports—are real, and not fanciful; and that in the character of the bunches and berries one of them shows the characteristics of Golden Champion to such an extent as to justify the observer in pronouncing it to be all but, if not wholly, identical, the differences now observable in size of berry and period of ripening between Trebbiano and the sport being trifling.

After all, it is to us surprising that this case should have been received with so much incredulity. One would think analogous cases had never been noted, that the *Cytisus Adami* was unknown, that Peaches and Nectarines had never been seen on the same bough, and that "sporting" or bud variation, in fact, was an unknown phenomenon. The special interest in the present case arises from the fact that the rod of Golden Champion had been cut away before the appearance of the sport.

The question then becomes narrowed to this—are the "sports" now existing on this Vine the result of previous inoculation with Champion sap or with Champion pollen, or are they altogether independent of Champion influence? Seeing how strikingly the Champion characteristics are reproduced in bunch and berry, we can but conclude that they have been so to speak Championised, and that the case is one of those exceptional instances where graft hybridisation has been brought about.

A strong reason for this opinion is in our judgment afforded by the fact seen this year for the first time, and now for the first time made public, of the existence not only of one bunch but of three, one of which is almost a Champion if not quite, the one above it, midway between the Champion and Trebbiano, and the third almost entirely Trebbiano. These intermediate bunches are to our minds most significant, and, if the history of the Champion were not known, would raise the question whether it had not originated as a sport in the first instance. But the Champion is stated by Mr. THOMSON

again is of composite origin; so that some settling down or filtration of the constituent elements should occur is not only what we might expect, but what we know does happen in other cases.

There is another explanation, but it is so improbable that we merely mention it. In some few cases pollen-hybridisation has been known to affect, not merely the seedling plants, but also the fruit of the parent plant. Such cases have been recorded, but they must naturally be received with hesitation. But, assuming the possibility of such an occurrence, it might be

seen is especially rich in good specimens of Cattleyas, Dendrobes, Phalenopsis, Lycastes, Aerides, Odontoglots, &c. Our illustration was prepared from a beautiful photograph by the London Stereoscopic and Photographic Company.

— FLOWER GARDENING AT CLEVELAND HOUSE, CLAPHAM PARK, has now for several years past been remarkably well done, and many who have seen it expressed their conviction that there was room for little or no further improvement. That such opinions were incorrect is fully proved by the beautiful arrangements which Mr. LEGG has this season made. We have heard it said of

FIG. 57.—VIEW IN MR. HEPBURN'S ORCHID HOUSE.

to have been raised as a cross between Mill Hill Hamburgh and Bowood Muscat. A sport or bud-variation is very frequently brought about by a separation of heretofore mixed elements, or by the sudden reappearance of the characteristics of a former generation. The offspring of hybrid parentage often manifest in this manner their paternal and maternal characteristics in different plants. Bud-variation may be due to a similar disentangling of previously mingled elements, or it may constitute an entirely new combination—a fresh departure. The Culford Vine, according to the history given of it, must have, or have had comparatively recently, a mixture of elements derived from five or six sources; each of those sources

that the pollen from the Golden Champion, transferred by bees or otherwise to the flowers of the closely adjacent Trebbiano, had caused the alteration in the berries of the latter. We know at once too much and too little of plant organisation to doubt the possibility of such occurrences, which must, like the Culford sports, be inquired into by the usual rules of scientific testimony.

IN our last issue we gave an illustration of a magnificent specimen of *Dendrobium Wardianum* in the collection belonging to J. G. HEPBURN, Esq., Sidcup Place, Kent, and have now the pleasure of placing before our readers a view in another of Mr. HEPBURN'S Orchid-houses (fig. 57), which it will be

the decorative gardening, known as carpet bedding that even when well done it admitted of so little variation that it was almost like ringing the changes on a peal of bells, which, to those not initiated in the performance, has much of a sameness about it. Yet so far is this from being the case that the plants that can be used in this description of gardening are sufficiently distinct in form, and possess such a variety of hues and shades as to admit of the most artistic and pleasing combinations of colour it is possible to conceive, and are the same time devoid of the too flat, even surface which conveys an idea that the object in view had been to pinch and distort every plant employed so as to destroy its individual character. "Carpet bedding" is no longer applicable to the greater portion of Mr. LEGG'S work this summer; "embossed bedding" would be a more expres-

sive term. Most of the beds and borders are freely relieved by raised, well-marked divisional lines and sloping mounds, on the top of which are planted small *Dracænas*, *Chamæpeuce*, *Agaves*, and *Pachyphytums*. *Mentha pulegium gibraltaria* plays a conspicuous part as a green ground, varied with green and glaucous *Sedums*; yellow ground colours are represented by *Mesembryanthemum cordifolium variegatum*, *Pyrethrum*, and the cream of white *Sedums*, *S. acre elegans*. All violent contrasts are avoided; the *Alternantheras* and *Coleus* are gradually toned down to the more subdued and grave ground colours, these latter much predominating, and until seen it would be difficult to realise the beautiful effect produced by the association of some of these plants with soft and subdued colours. Noticeable in this way we may mention *Sempervivum calcaræum*, used as a setting in the dividing lines of *Sedum glaucum*, where the slightly bronzy tinge of the points of the leaves produce a beautiful effect by contrast with the metallic-hued fashion in which it is half embedded. *Nertera depressa*, which some people find difficult to manage, is very much finer here this season than it has ever been before, the berries on many of the little patches not only being as close as they can stand but almost piled on each other. The circular beds filled with large-leaved plants are in good order without being too coarse and rampant to harmonise with the rest; and the condition of the whole bears the stamp of careful and patient study, not only in the conception and working out of the different designs but also an intimate acquaintance with the nature, requirements, and capabilities of the various plants used. All who are interested in this style of bedding should pay a visit to Cleveland House at once, as we understand Mr. LEGG has resigned his charge of the gardens here, and leaves at the end of the season.

— The Corporation of Bolton are about to make a new cemetery, and offered two premiums of £30 and £15 for the best plans for laying-out the same. Thirteen plans were sent in, and the prizes were eventually awarded to Mr. R. K. FREEMAN, Architect, Bolton, and Mr. ALFRED CALDWELL, Knutsford, first, and Mr. JOHN SHAW, of Bowden and Manchester, second.

— We have received from Mr. J. HART, King's House, Jamaica, a couple of Pine-apples, there known as "Ripleys," or white and black Ripleys. They are said to be the Pines of Jamaica, all the other varieties being banished from the table in their favour; and are moreover stated to have been raised from seeds sent to Jamaica from the Island of Antigua. Considering that they were cut before they were quite ripe, to facilitate travelling, they proved to be uncommonly good as compared with the usual run of imported fruits, but as to their identification we can do nothing more than suggest that the sort called Black Ripley may probably be the Black Antigua, but, in the absence of foliage, we are unable to say with any degree of certainty. The White Ripley comes nearer to the description of the old Ripley (not Ripley Queen), but here also we are uncertain.

— The inhabitants of Richmond and Kew remind us of OLIVER TWIST. They are among the most favoured of suburbs—they have a noble park, a terrace, an unequalled river walk, kept up at the Government expense, and now they want more. They are clamouring for the EARLIER OPENING OF KEW GARDENS, and for the removal of what is, no doubt, an eye-sore to neighbouring householders. We presume the opening of the gardens at an earlier hour is chiefly a matter of expense—more police would be wanted. But this is a matter for the Treasury. In any case, we think the authorities would be wise to accede to the request for an earlier opening of the gardens, at least in the summer months. In the case of the houses, a difficulty exists from the hindrance to the necessary work which the presence of the public entails. In all such questions it must not be overlooked that the primary object of Kew is not to supply a recreation ground for local nursemaids or Cockney excursionists. The primary aim of Kew is, and should always be, the advancement of botany and scientific horticulture at home and in the colonies. In the other parks and recreation-grounds of the metropolis the object is altogether different. Still if consistently with the special purpose of the institutions

in question other objects can be carried out, by all means let them be.

— Two very fine examples of *LAPAGERIA ALBA* growing in pots can now be seen in bloom in the stove-house at Bearwood, Wokingham, the residence of JOHN WALTER, Esq., M.P. Not only are these plants flowering freely, but they bear as many as five blooms in a cluster, and it is almost needless to state the plants are found of great value for cutting from. In the same house *Tacsonia exoniensis* is remarkably fine, growing and blooming with wonderful freedom. It is a prime favourite with Mr. TEGG, the gardener at Bearwood, who praises it highly.

— Perhaps it is because the cool moist summer suited the plants best that *PHLOX DRUMMONDII* has proved very fine this season. At Cardiff Castle one of the exterior Vine borders was planted with a quantity of mixed varieties of the large flowering forms known as *grandiflora*, which are great improvements on the smaller types of a few years ago. The soil was good, the flowers were large, numerous, and finely coloured. If the *Phlox* has a drawback, it is the freedom with which it seeds, but it is not a difficult matter to keep them gathered, so that the energies of the plants may be directed to the production of flowers.

— The Police Station in New Street, Basingstoke, cannot be, in any sense of the word, a "terror to evil-doers" as far as its exterior aspect is concerned. Unlike many modern constructions, which are of a cold, formal, and somewhat repellent character, this is in appearance a floral palace, for it is covered with a rare growth of creepers such as *Jasmine*, *Glycine*, *Virginian Creeper*, *Roses*, and such-like, and on the window-sills, hanging against the walls and crowded on raised stands, are numbers of bright flowering plants, all well cared for and singularly effective. It represents a bright and attractive spot in the midst of this respectable Hampshire town.

— From the *Botanische Zeitung* we extract the summary of an "inaugural dissertation" by FR. RESA, ON THE PERIOD OF ROOT FORMATION. It is in the author's own words. Three kinds of roots, connected by transitional stages, may be distinguished—extension roots, by which the root system is enlarged; and absorbing roots, consisting of much-branched fibrous roots, and sometimes of secondary rootlets, increasing the surface of the latter. A periodical dying off of roots was only observed in *Æsculus*. In the growth of roots there is a certain fixed and specific period, influenced by the weather, but it never coincides with the growth of the parts above-ground; on the contrary, a division of labour is always perceptible. In the flat-leaved plants investigated it was found that there was root-growth in autumn after growth above-ground had ceased, which is completed sooner or later according to circumstances. The winter has only a retarding influence on root-growth, and does not terminate it. Needle-leaved plants (*Coniferae*) stand so far in contrast to the flat-leaved plants that the autumn and spring shoots are separated by the winter. Respecting the beginning and continuation of the course of the period of development, the influence of favourable and unfavourable weather has already been sufficiently dwelt upon. But just as a seed, a bulb, or a bud will not develop "before its time has come," and often cannot be made to grow at all, so we must regard the period of the root-formation of plants as a hereditary property. The question as to the place where the new fibrous roots originate may be answered in this way, that in general the roots of the highest order have the preference, without, however, excluding those of older orders from being able to produce new rootlets.

— The prevailing depression in trade is being felt among the woollen manufactories and other departments of business at Trowbridge, consequently on the occasion of the annual exhibition of the Trowbridge Horticultural Society the streets were not so generally decorated as is usually the case. It was felt to be a decided loss, as the country people, who are great sightseers, are as much attracted by the town decorations as by the flower show and the fireworks. But there were two notable exceptions to the general falling off in street decorations one the remarkable

Gothic archway erected by Messrs. HADEN BROS., engineers, Silver Street. This was an imposing and admirably constructed piece of decoration, graceful in outline and well-proportioned. A light but sufficiently strong framework of wood spanned the roadway, and there were smaller arches on the pavement on either side. The framework was covered with evergreens, and over the smaller arches were, on the one side, a triangular shaped shield edged with flowers, with "Welcome to all," and on the other, "Good night." The royal monogram, in floral letters, came out conspicuously against the dark green background. Flags tastefully arranged in groups, and placed at intervals round the arch, gave a life and colour to the structure and above the crown, at the top, rising some 40 feet above the roadway, waved the British ensign. At night the structure was lit up with unusual brilliancy, by means of 1400 gas jets, distributed over the surface. It was the general opinion that such an arch has never before been witnessed in the West of England, and its erection must have entailed a large expenditure of time and money. The other exception was the Great Western Railway Station, which is always dressed out with excellent taste and skilful decorative effect by the station master, Mr. J. A. COX, who was on this occasion even more successful than usual. Huge Spruce Firs were planted at intervals on the spacious up-platform, and the topmost boughs of these were thickly hung with mimic banners. Wreaths of evergreens were suspended in all directions, and flags hung out bravely in the breeze. The notice board containing the name of the station had the sensible motto, "Be merry and wise." Mr. COX, who is a hard working member of the committee of the flower show, deserves much praise for the admirable display. We are indebted to the *Trowbridge Advertiser* for some of the foregoing particulars; and the report of the show given by this paper was as accurate as it was comprehensive—a marked contrast to many local performances of a similar character.

— At a late meeting of the Horticultural Society of Berlin, one of the members described and recommended the CULTIVATION OF RHUBARB for eating. Although in Hamburg it is largely grown and consumed, at Berlin it is only known to a few amateurs, and few even of those who have a chance of trying it are able to overcome their prejudice against the name, and housekeepers declare that it consumes too much sugar. However, two or three of the members of the Society who have grown it for some years, and are able to appreciate the real merits of some of the first-rate varieties, are now endeavouring to promote the cultivation of Rhubarb. In the discussion that followed nobody appeared to be aware of the large extent to which Rhubarb is forced in this country, and of its value as a cheap substitute for expensive fruits during the winter months. Rhubarb jam is to be had in Berlin, but there exists, as was long the case here, a strong prejudice against it simply on account of its name, which the people associate with the drug obtained from the root-stock.

— One of the leading horticultural societies in the south-west has among its rules and regulations one to the effect that any exhibitor dissatisfied with the judgment in any class in which he exhibits may enter a protest against the awards, provided such protest be furnished in writing to the committee before 4 o'clock in the afternoon of the show day. This is an unusual rule, and scarcely to be commended; and it also leads to awkward results, as was seen at a recent exhibition. Two of the judges made their awards in a certain class for plants, and the exhibitor awarded the 2d prize sent in a protest as provided by the regulations. Two other judges were requested to express their opinion, and they unanimously declared in favour of the 2d prize collection as the best of the two. The result was that both collections were placed equal 1st. But what an unenviable position for the judges who made the first award!—for the modification of their decision practically amounted to an expression of their unfitness to fill the office to which they had been appointed. The committee may reasonably anticipate a considerable addition to the number of protests from disappointed exhibitors at their next show. Perhaps it would be as well if the judges appointed for next year were to subject themselves to a competitive examination at the hands of the exhibitors before undertaking the office.

— We have before us the *Boletín Oficial de la Comisión Central de Agricultura de la República Oriental del Uruguay* for June of the current year, which, according to an announcement on the cover, is published on the last day of every month. This is a well-printed and apparently carefully edited journal, the number in question consisting of some fifty pages of closely printed matter, chiefly, it is true, extracted from European publications, but none the less useful, probably, to the farming community in that country. The principal original articles are on the establishment at Fray Bentos for preparing *LIEBIG'S Extractum carnis*, and some agricultural statistics of the colony Diaz.

— *TULIPA KAUFMANNIANA*, Regel, figured in the *Gartenflora* for July, is a very beautiful and distinct new species, collected by a son of the learned Dr. REGEL, Director of the Petersburg Botanic Garden. Very different from the gaudy *T. Greigi*, with which it was found growing on the mountains of the Tschirtschick River valley, in Turkestan, it is a modest, pretty, and attractive species, probably destined, as Dr. REGEL observes, to become the mother of a new race of Tulips in our gardens. It rises about 6 inches above the ground, the stem being 2-leaved, and the leaves about as high as the top of the flowers. The narrow bell-shaped flowers are about 1½ inch deep, the segments narrow, elliptical, oblong, obtuse, or the inner ones emarginate. A peculiarity of this species is the relatively short pistil, which is only about half or one-third the length of the filaments. Two varieties are figured, albo-variegata and luteo-variegata, the first with a white ground inside, passing into a beautiful yellow towards the base, and suffused with pink on the outside. The other has a tender pale yellow ground inside, with a carmine spot below the base, the three deep red outside bordered with yellow. Several other varieties as to colouring occur, and this species promises to be a valuable acquisition.

— The *Journal des Roses* for August devotes a portion of its space to the recent exhibition of the National Rose Society at St. James' Hall. Speaking of the English system of exhibiting Roses, our contemporary states that the English Roses are "larger and richer in colour than the Roses of any other country in Europe." Think of that, ye grumblers at the climate of fog and suicide!

— We are requested to state that in consequence of the Great International Show being held at Carlisle next week, the usual monthly meeting and dinner of the Horticultural Club will be held on September 18, instead of September 4.

— The floral decoration of the Agricultural Hall was very successfully accomplished on Tuesday last, but as the display was one of no particular interest to horticulturists generally, we need say no more than that the leading prizes were pretty equally divided between Mr. WILLS and Mr. B. S. WILLIAMS, and that Mr. TURNER and Mr. LEVISO also secured some awards. In the "Garden Requisite" department the display was poor in the extreme.

— We fear it will not do to put too much trust in "SALUS" as an antidote to the POTATO DISEASE. The worst patch we have seen this year was one dressed with this material, and by its side was a similar patch of equal size, and planted with the same variety of Potato, which had not been treated with the Salus. It was quite evident that the Salus had acted as a fertiliser, the haulms being more vigorous and taller where the Salus was applied; but the whole patch was equally, and very severely, attacked with the disease. Mr. SMITH'S report on the Potatoes at Chiswick will be found in another column.

— Dr. PIESSE, of Hughenden House, Chiswick, states in the *Times* that the real average yield of ATTAR OF ROSES in the district of Kazanlik is 1736 lb.; Gueupsa, 754 lb.; Karadja-Bahg, 384 lb.; Tchirpan, 162 lb.; Koyoun-Tépé, 118 lb.; Pazarjiki, 110 lb.; Yeni-Sagbra, 108 lb.; Zaghra, 98 lb.; say, total of 3470 lb., or 55,520 oz., which in truth is understated by these estimates, because the Turkish ounce in weight is rather more than as 17 is to 16 English. However, it may be taken in round numbers that the pure attar at 30s. per ounce produces for Roumelia an income of, say, over £80,000 per annum. Dr. PIESSE adds:—"Ruined, as you say, by the Russian cam-

paign, at least for many years. Come, then, Western Australia; come, then, Queensland; come, then, Fiji!—all the Roses you can grow will be a welcome to British commerce."

— *CEANOTHUS AZUREUS* should be grown on every flower garden wall having a sunny aspect. Not only is its beauty beyond question, but it blooms at a season when flowers other than "bedders," and the like, become scarce. Mr. EARLEY tells us that in February last he cut a large plant in—leaving not a leaf, and he now has a marvellous display of cool azure-blue blooms, of which he has sent us a splendid sample.

— The following memorandum, showing the different descriptions of roots and herbs eaten by the poorer classes during the present distress at Coodor and the neighbouring villages has been sent by H. H. YARDE, Esq., Deputy Conservator of Forests, Coodor, in the Cuddapah district, to the Agri-Horticultural Society of Madras:—

Telugu Names of Roots and Herbs.	Potanical Names.	Mode in which the Roots, &c., are prepared for Food.
<i>Roots, &c.</i>		
Kulabunda Gadda	<i>Aloe indica</i>	All the outer portion of the plant is removed, and only the succulent substance found in the centre boiled and eaten
Nagamalapundloo	Cactus species (Prickly Pear)	The ripe fruits of the Cactus are eagerly consumed by the poor. The thorns are removed, and the raw fruit eaten
Eitha Gadda	<i>Phoenix farinifera</i>	The substance found in the tender stems is eaten
Alli Gadda	<i>Villarsia cristata</i>	This is a species of Water Lily found in tanks and wells. The substance found in the plant is cooked, or merely boiled and eaten
Thamara Gadda	<i>Nelumbium speciosum</i>	A plant of the Lotus species. The substance found in this plant is either cooked or consumed in a raw state
Yella Gadda and Injadi Gadda	<i>Roxburghia gloriosoides</i>	These bulbs are found on the hills, and form the chief food of the Yanadies, the hill tribes; but since the spread of famine the poorer classes are also eating them. The roots are boiled and eaten.
Mamidi Ethnalo	<i>Mangifera indica</i> (seeds)	The seeds are collected, and the kernels are either pounded and boiled into a sort of porridge, or merely roasted and eaten.
Chinta Ethnalo	<i>Tamarindus indica</i> (seeds)	Do. do.
<i>Herbs, &c.</i>		
Pála Kura	<i>Holostemma Rheedianum</i>	These herbs are gathered and boiled with some salt and Chilies and eaten.
Davadya Kura	<i>Sethia indica</i>	Do. do.
Eoddi Kura	<i>Rivea hypocrateriformis</i>	Do. do.
Nelli Kura	<i>Premna latifolia</i>	Do. do.
Chinta Aku	<i>Tamarindus indica</i> leaves	Do. do.

— In a report by the British representatives in HAYTI amongst some notes on the natural history of the island it is stated that the country is one of woods and forests, trees of all kinds being very abundant. Amongst the indigenous trees of economic value are enumerated Mahogany, Logwood, Fustic, and Lignum-vitæ; and amongst valuable edible plants that have been introduced occur the Mango, Cacao, Coffee, Orange, Apple, Breadfruit, Almond, Walnut, Fig, Sugar-cane, as well as Cotton, Indigo, Bamboo, and many others. Many of our commonest cultivated esculents, such as the Carrot, Cabbage, Turnip, Onions, Peas, Beans, and Beetroot, grow well. With regard to Coffee we are told that the commercial season commences in November and lasts till the end of March following. "During this period considerable activity prevails at the open ports to which the Coffee is brought from the plantations. It arrives in various ways—in coasting vessels, on beasts of burden, in hags and parcels carried by women and children on the head; but in whatever way it comes, it is anxiously expected by numbers to whom it brings profit and employment—brokers, driers, pickers, fillers, weighers, stevedores, and boatmen. The general activity thus prevailing communicates itself to local trade in all its branches so that in the capital, as well as throughout the country, the Coffee season is the season of the whole year." One plant referred to in this report is so

remarkable in its action that we quote the report in the writer's own words: he says that it has "such strong narcotic powers that in the hands of a skilful practitioner it will produce coma of any intensity or duration, or even death itself when so intended. The knowledge of this plant is confined to a few families, who transmit the secret as an heirloom from generation to generation, and the heritage is highly prized, conferring, it is thought, the attributes of miracle-worker and priest, for the plant is in many ways used in aid of solemn imposture, superstition, and even crime. The power thus exercised is called 'Wanza,' a word that inspires the African with awe and dread. The Wanza priest can throw into a death-like coma, and knowing the moment of returning consciousness, he will make a show of returning to life. If a burglary is to be committed he can, by means of his art, cast a deep sleep on all indoors; and one may understand how he can attain other forbidden ends in the same way." Such is the account given of the uses of this plant, but no description, however rough, is furnished of the plant itself, or any clue to its identification. Whether the plant is actually unknown, or whether its name only is referred to by the writer when he says, "An experienced botanist could not fail to discover this plant, which as an anæsthetic would no doubt prove a valuable acquisition to medical science," we are left in doubt.

— In the temperate-house at Kew is now in flower a shrub seldom or ever seen elsewhere—*PAVETTA CAFFRA*. The plant at Kew is small, but its trusses of dead white flowers contrasted with its deep green foliage are very effective.

— The *Revue Horticole* publishes a woodcut of *CAMPANULA MACROSTYLIA*, of which we have also seen specimens. It is an annual of straggling habit, with large, open, purple bell or cup-shaped flowers, with a calyx like that of the Canterbury Bell, and a very long style, the stigmas of which cohere in a club-shaped mass. It is a very distinct looking plant, which lovers of annuals should be on the look-out for.

CARLISLE.

In continuation of our Carlisle notes we may add that a visit to Brayton Hall, the country residence of Sir Wilfred Lawson, M.P. for Carlisle, will be interesting to the horticulturist particularly, and to the sightseer generally. It is about 18 miles from Carlisle, and is reached by the Maryport and Carlisle Railway, which passing through the pleasant valley of Cumberdale, past Dalston on the left, Crofton Hall, the seat of Sir Robert Briscoe, Bart., on the right, past the thriving and picturesque country town of Wigton, reaches Brayton Station. On alighting here the visitor will at once perceive a handsome new entrance lodge, which will direct him to the spot. The Hall is a palatial building, forming three sides of a square. On the east or open side is the principal entrance. The south front is adorned with a most chaste and effective panelled flower garden which runs the entire length of the building. On the west front is a considerable stretch of lawn dotted with fine trees, amongst which are three Larches of singular appearance, they having in their early days pushed out branches a few feet from the ground, which, contesting the leadership, are nearly as thick as the main trunk. The views from the terrace and windows are extensive and diversified. To the east and south is the fertile valley of Ellen, with Caldbeck Fells, Benness, and cloud-capped Skiddaw rising in the background. To the north and west in the distance are Criffell in Dumfriesshire, the hills of Galloway and Kirkcudbright, and the Solway stretching away to the west, as far as the eye can reach, like a silver thread. A walk leads through a unique flower garden, in which will be noticed a perfect specimen of the cut-leaved Beech—past the gardener's house, and a fine piece of water, to the kitchen garden, which is complete in its arrangements. The hothouse accommodation is extensive, new, and equipped with every modern improvement, comprising a range of vineries and Peach-houses, the occupants of which are in a most thriving condition—of stoves and greenhouses filled with choice specimens in luxuriant health, and Cucumber, Melon, and Strawberry-houses and pits and frames *ad libitum*, all reflecting credit on Mr. Hammond's careful and intelligent skill.

A three-quarters of a mile walk will bring the

visitor to the pleasant agricultural town of Aspatria, where the return train can be taken to Carlisle.

Six miles south-west of the city is Rose Castle, the residence of the Lord Bishop of Carlisle, a fine old building, celebrated in story, and situated in the Vale of the Caldew, amidst fine picturesque scenery. The drive in this direction is well worth the hire of a horse and conveyance. At the start from English Street, facing which and the New Victoria Aqueduct are the new premises of Messrs. Little & Ballantyne, now in course of erection, and rendered necessary by the wide extension of their business. They are from designs by C. J. Ferguson, Esq., the Diocesan architect, Grecian in style, of chaste outline, and will, when finished, form one of the most striking architectural features of the city. They are built of the celebrated Lazenby sandstone, which possesses a rich, warm tint, so much admired by Southerners, and of which all the railway stations and buildings on the new section of the Midland Railway between Settle and Carlisle are built. The visitor will proceed over the new viaduct, an immense undertaking, which bridges over the bewildering network of railways converging from all points of the compass into Carlisle, and connects the outlying suburbs in the Caldew Vale with the business part of the city. This will shortly be opened by H. R. H. the Princess Louise, attended by all the pomp and ceremony of municipal display.

On leaving this the ground soon begins to rise, until the cemetery, a tastefully laid out piece of ground, is reached, when a look back at the old city, castle, and cathedral, will show it from a picturesque, and, if the tourist is of a military turn of mind, a strategical point of view—the principal one in olden times. Indeed, on the other side of the valley, on a prominent spot, stands a farmhouse, where "Royal Charlie" took up his abode for several nights during his memorable incursions in this quarter.

A quaint old village will next be reached, with its picturesque church; then onwards for a space by the banks of the Caldew, on which are situated manufactories of some importance—amongst others, the spade foundry of Messrs. Cowan, examples of whose horticultural implements will no doubt be seen at the show. Near here, amidst vales and fine old trees, is the beautiful residence of Colonel Salkeld, another of the historical families of the Border. Close by is Rose Castle. The drive may be prolonged to Mealsgate, near which is Whitehall, the beautiful residence of the late lamented George Moore, Esq., of London, whose melancholy death, resulting from the effects of an accident in the streets of Carlisle, caused so much regret last fall. Situated as it is on the confines of the lake districts, the scenery is delightful and grand. The drive back can take place by way of Brayton and Wigton.

The principal places of interest for the horticulturist to see by the way of the London and North-Western Railway, within easy reach of Carlisle, are Lowther Castle and Brougham Hall. Lowther Castle, the seat of the Earls of Lonsdale, has been so often described, and is withal so princely a place, that it has become one of the lions which must be seen. The nearest station is Clifton, about 21 miles from Carlisle, and half-an-hour's walk through woods and finely timbered parks will bring the visitor to the Castle gardens, where we shall leave him with Mr. Shand, trusting some day ourselves to record the improvements which he is carrying out.

To the left of Clifton Station, coming from Carlisle, is Brougham Hall, the baronial residence of Lord Brougham. It is surrounded by fine romantic scenery, and the building shows signs of having been built in the times when "might was right." Attached is a quaint chapel, in which are many curious carvings, collected and placed there by the late celebrated Lord Brougham, which will be looked at with much interest. The gardens, which are under Mr. Campbell's care, do credit to his skill. There is a fine orchard-house, and a choice collection of Orchids. The clothing of large, bare, and otherwise unprofitable tracts of ground is a large item in the estate management here.

Greystoke Castle, the seat of H. C. Howard, Esq., formerly the property of the Dukes of Norfolk, who still enjoy the barony of Greystoke, stands in a picturesque park of 5000 acres. The present mansion was erected within the last 100 years, near the site of the ancient castle, which being garrisoned for the king in 1648, was taken and destroyed by the Cromwellian army. The present building is of great massiveness, but late improvements have caused it to assume an ap-

pearance of considerable elegance. It is easy of access, being about 5 miles west of Penrith by road; the drive affords one of the most variable and interesting bits of landscape and mountain scenery possible to be found in the North of England, especially so on nearing the Castle. The views embrace the distant lake and mountain, commanding also one of the most beautiful wooded parks in the North. The Castle, which is situated on an eminence, shows its towers and battlements amidst gigantic trees, and the extensive plantations are embellished with several ornamental buildings. The approach to the Castle is a gradual ascent from the north-east. On the east and south it stands on the brink of a precipice. On the west side, again, are a beautiful terrace, and grass slopes ornamented with lofty Lime trees, with their graceful branches hanging over a splendid sheet of water, which is made very picturesque by its flowing around several islands, and which in its course falls over a cascade about 20 feet into another sheet of water of considerable extent, of a serpentine form, with grass slopes and shaded walks, overhung with shrubs and ornamental trees, some of which may be mentioned as remarkable for their great height and circumference of stems—viz., the Silver Fir, measuring 16 feet at 6 feet from the ground. The water again rushes over a natural fall some 36 feet in height, and passes by an arch through the fence of the pleasure-ground, which is well laid out and very picturesque.

Returning to Carlisle the visitor may make an excursion by the Caledonian Railway. Near Kirtlebridge Station he will find Springkell, the seat of Sir John Heron Maxwell, Bart. This place is associated in border history with the tragedy of "Fair Helen of Kirkconnel Lea," which may interest the romantic tourist. Northwards is Ecclefechan Station, about 3 miles from which is Burn's Wark Hill, from the top of which a fine view of the beautiful and well cultivated vale of the Annan may be seen, the Solway Firth and the Cumberland coast and mountains in the distance. Ecclefechan is the birthplace of the great historian, Thomas Carlyle. Pursuing our course in a westerly direction is Castle Milk, the seat of R. Jardine, Esq. The house is a modern erection, most beautifully situated amongst fine trees on the banks of the Water of Milk. The gardens are commodious and well laid out, and are under the management of Mr. Findlay. Near here is Hoddam and Repentance Tower, from which fine views can be obtained, also Lochmaben, and the ruins of Bruce's Castle.

A run by the Glasgow and South-Western Railway by way of Annan will bring the visitor to Dumfries, which is surrounded by many gentlemen's seats, well worthy of a visit, and where the horticultural spirit is carefully and studiously nourished. Amongst these we may mention Terregles, The Grove, Friars' Carse—sacred to the genius of Burns—Munches, Ernespie, and by rail to Thornhill, for Dramlanrig. The latter place will, of course, require a special visit; and, as it is within a day's run to and from Carlisle, many will avail themselves of the opportunity.

By the North British Railway a run may be made to Langholm. The scenery is delightful, and the town interesting. Here is Langholm Lodge, one of the seats of the Duke of Buccleuch, Potholm, Craigeleagh, and a few miles on, nestled among the hills, is Aikleton, where those monster bunches of Grapes which have astonished the world were grown, and where everything else, even to a stick of Rhubarb, receives the same diligent attention. A delightful drive up Eskdale from Langholm will be a great treat to the Southern visitor; the hilly scenery is so different to the level plains of the South, and as the roads are good and good drivers and conveyances can be had, some may be glad of the hint. Silloth, the Brighton of Cumberland, can be reached in an hour's journey, and the healthful sea breezes enjoyed.

Home Correspondence.

The Rose Season.—The queen of flowers has produced the best return that we have noticed for some years, the flowers being large, symmetrical, and well up in colour; the plants themselves have not suffered from rust and mildew, as we have seen them other years; and the autumn crop of flowers promises to be good also. What with so much clean healthy growth and abundance of moisture, everything looks well for next year. Notwithstanding the untidy appearance of mulching in summer in decorative quarters its advantages are too important to be slightly overlooked; how it saves labour, how it benefits the roots

in the retention of moisture, and how it adds to the quality and general appearance of the flowers, is too well known to require further comment here. Our own stock does not embrace many new varieties or novelties, those of "tried constitution" we find to suit our climate best; we never risk much on novelties before we have more than a paper account of their beauty, habit, and constitution: the latter is worth inquiring after before we enter on vague speculations. If we read over any prize list we invariably find the names of many old Roses well to the front. Just observe the well-stocked rosary, when all are in proper condition for inspection, and you have some trouble in distinguishing variety or even shade from amongst so many hundred names. Perhaps a little classification would assist beginners in selecting those colours, or different shades of colour, that would please the fancy; all are doubtless possessed of some degree of merit or beauty, and any improvement, however little, is sure to be heartily welcomed. Whilst our Roses were in bloom all our vases and dinner-table epergnes, &c., were done with Roses alone, with well-selected leaves, the only addition being a few sprays of Mignonette—true simplicity and a natural effect being our aim throughout. How a half-expanded bud or a bunch of buds with one or more rather advanced can be made to shine in a simple way and quite eclipse any other combination of colours, will be duly appreciated by all lovers of the Rose; nothing sets off a Rose like one of its own leaves, and defects can be filled up and humoured as required. Now about classification. Something might be done to improve existing arrangements; there are so many names with little or no difference to distinguish them by, and if we had a list from which a convenient selection could be made in a few telling colours many a rosary might be made to look different. I append a short list of those that have done best in our climate, from notes taken when the plants were in full bloom, as follows:—Abel Grand, Alfred Colomb, one of the finest crimson Roses grown; Marie Baumann, Dupuy Jomain, Captain Christy, one of the best of the Centifolia type, and a vigorous grower; Star of Waltham, Baronne de Rothschild, Général Jacqueminot, Ferdinand de Lesseps, Fisher Holmes, always a favourite for its depth of colour and imbricated form; Mdlle. Marie Rady, Madame Vidot, Madame Fillion, Madame Lacharme, Maurice Bernard, Bernard Verlot, Mdlle. Bonnaire, Duke of Wellington, La Ville de St. Dennis, Mdlle. Marguerite Dombain, La France, François Michelin, Louis Van Houtte, Reynolds Hole, Horace Vernet, Mdlle. Eugénie Verdier, Xavier Olibo, deep crimson and a truly good and beautiful Rose. *W. Hinds.*

A Few Suggestions for an Autumn Rose Show.—It will scarcely be disputed that the greatest feature in the improvement of Roses is perpetuating the habit of blooming a second time through the autumn as well as at the usual season. Indeed it is that habit which constitutes their superiority over the summer Roses, many of which in symmetry of form and beauty of colour quite equal the finest of their modern rivals, to which also they are not inferior in vigour of growth nor hardness of constitution. It is surprising, therefore, that few if any attempts are made to encourage autumnal bloomers by the establishment of Rose shows in September, on a similar scale of magnitude to the great summer exhibitions. Considering the undoubted popularity of such spectacles, there ought to be little fear of want of success as a commercial speculation, while the numerous benefits to the progress of the flower ought in itself to justify the venture. There are many of the finest varieties which scarcely show themselves in their best character in their earlier blooms. For instance, Charles Lefebvre, Gloire de Dijon, Malmaison, and many of the hardy Teas grown out-of-doors—for it must be recollected that many specimens of the latter exhibited earlier in the season are really cut from flowers under glass. There are likewise not a few amongst the Bourbons and Noisettes—essentially autumn Roses—which if not monstrous are of exquisitely perfect form, the display of which might work some little improvement in public taste, now vitiated by the craving for sensational size. To say there would be a difficulty in getting together blooms of sufficiently high quality to grace the show-tables is to throw a slur upon the very proerty upon which the *raison d'être* of the leading class of the day—the H. P.'s—is based. Or, again, it would imply that the resources of the exhibiting trade firms had been exhausted by their summer displays—an admission few would care to make. Moreover it affords an opportunity for the proprietors of Rose grounds who from circumstances of locality, climate, late soils, and other drawbacks, are rarely in a position to exhibit at the date of the fixtures of the great summer shows. As an encouragement for some endeavour in the direction here proposed, we recollect one (and only one) occasion. At the Crystal Palace an autumnal Rose show was held; that usually held in June or July had been from adverse climatic influences a comparative failure, but its successor was an unquestionable success, as was

remarked at the time, as far as the number and quality of the specimens was concerned. But, granting in some instances perhaps we might not get such overgrown samples of certain individual flowers as appear on the tables earlier in the year, what we lost in size we should gain in symmetry and finish, no mean considerations. Besides it would afford amateurs an opportunity of estimating the true character of varieties, and of so directing their choice to the exclusion it may be of the coarse and ragged monstrosities, so eagerly booked by the inexperienced and unwary at the summer exhibitions. Even if insuperable difficulties were found to the establishment of a separate Rose show that in the autumn for fruit and flowers might be utilised for the object here proposed, by making Roses a prominent portion of the prize schedule. I throw out these suggestions in the hope they may attract the consideration of the enterprising managers of the Alexandra Palace, the place of all places for floral or cognate exhibitions. The brilliant success of the display of last July would no doubt induce the public to flock to a spectacle somewhat similar in kind, but yet out of the common way. *W. D. Prior.*

Gloxinia erecta and its Varieties.—These beautiful plants stand well in the conservatory and the drawing-room, and can be easily kept in flower throughout the year. I have had them in bloom here for more than two years, by placing twelve plants in heat every three weeks. They are easily increased by cutting up the leaves, and putting them in sand in heat. When the bulbs are formed, pot them off in sandy peat, and keep them in heat till they are large enough to ripen off; they are also easily raised from seed, by sowing them in sandy peat, with a very light covering of sand over the seed. So soon as the bulbs are large enough, pot them, and treat as above-mentioned for the cutting. I think 5 or 6-inch pots the best size to flower them in, and most useful size for the room. The best soil is rough peat mixed with sand. When out of bloom I place them on shelves, and keep them dry, in a cold house, till wanted. *Wm. Smythe, The Gardens, Basing Park, Alton, Hants.*

East Lothian White Stock.—I have sent for your inspection a plant of East Lothian White Stock. They are such beautiful things, and a select strain of them are worthy of especial care. The strain of this sample is the same as we grew here and had so fine three years ago; the seed was saved from a particularly fine type of white single, and you would be almost surprised to see how fine some of them are: some are a good deal larger than the one sent, though at present no better flowered, and they are only grown under ordinary circumstances. Good white flowers of almost any kind are often in demand, and such as this I feel sure you will say is very good. *Robert Mackellar, The Gardens, Abney Hall, Cheddle. [Very good indeed. Eds.]*

A Useful Plant.—What is termed "table decoration" has certainly gone beyond itself—has, in fact, become exhausted and ridiculous, and when I see such plants as the poisonous Hemlock and the deadly Nightshade proposed as decorative plants, I cannot help thinking their advocates have not only gone beyond but beside themselves, and I am prepared to bear of the "charming green Nettle," or the "tomentose Thistle" appearing in the cornucopias of our dining-tables. How palatable the "dinner of herbs" must be in a room decorated with Nightshade and Hemlock! The plant I would introduce to notice, *Thalictrum Jaqueminiana* [?], grows about a yard high, very bushy, stems stout and strong, shoots the thickness of Wheat-straw, the whole of which from the ground upwards are covered with beautiful Fern-like foliage, not easily distinguished from the *Adiantum*; indeed, a compact form of this plant is sold as *Thalictrum adiantifolium*. Nothing can equal the utility of this plant for toning down large masses of flowers, whether in vases or baskets. Lengths of the stem, with a single leaf attached, are admirable for thrusting in vases, &c., of flowers when put together, lasting for a week or more, and giving as complete a finish to the whole as the bit of Maidenhair does to the bridal bouquet. In conclusion, I may add that were I in the bouquet business I should grow a hundred plants of it. The plant is as hardy as a Nettle. *T. Williams, Bath Lodge, Ormskirk.*

Are Small-flowered Peaches the Best for Forcing?—A week or two ago I had the pleasure of spending a day in the company of two gardeners who stand high in their profession. One of them like myself was a visitor, but all were keen in the acquirement of "wrinkles," and as a matter of fact we talked "shop" all day. Amongst other things discussed was the merits of various sorts of Peaches and Nectarines for early forcing, and while this was going on our host expressed a decided objection to large flowered varieties, as many years experience had taught him that for early forcing—that is, to have

the fruit ripe in May—the small-flowered varieties were the best. This was the first time that I had heard such a "notion" propounded, and I should be glad to know if such is the experience of any other of your readers. The subject is an important one to many, hence this note from *Cader Ibris*.

Camellias in Sussex.—A grand specimen of *Camellia alba-plena* is growing on a lawn behind a cottage in Battle. It is 15 feet through and as much in height, and has hundred of buds set. The plant is furnished to the ground, and is in the best of health. *A. O.*

Carnivorous Plants.—I have a plant of *Sarracenia flava* with several well-developed pitchers, and for some weeks past I have with much interest watched the flies and bees at the plant. They generally settle upon the under surface of the lid of the pitcher, from which they evidently suck a fluid or matter, which stupifies or intoxicates them. In this condition they then drop into the pitcher, from which they cannot escape. I should like to know if any of your numerous readers ever observed this peculiar effect. *Alex. Paterson, M. D., Fernfield, Bridge of Allan, N. B.*

Mildew on Grapes.—A gentleman living near Liss had a Vine (growing out-of-doors) infested with mildew, and was advised to take it down from the wall, carefully scrape off all the bark, and nail up the Vine again. He followed the directions given and effected a perfect cure: the Vine has borne well ever since and the Grapes have not a trace of the disease, so I have been requested to inquire in the pages of the *Gardeners' Chronicle* and other journals if this mode of treatment is always to be depended on, or if the cure in the case I allude to was not an accidental circumstance. *Helou E. Watney, Berry Grove, Liss. [Probably accidental. Eds.]*

How to Destroy Wasps' Nests.—I cannot tell Mr. Jean van Volxem (see p. 250) where he can purchase cartridges for smoking out wasps' nests, but I have made them in the following manner:—Take two parts of rock powder and one part of sulphur. The powder should be made damp and pounded small (mixing the sulphur with it before pounding), then take a small portion of it, and roll in brown paper, about two tablespoonfuls for a cartridge. When evening has set in and the wasps are all likely to be in their nests pay them a visit, light one end of the cartridge and place it in the nest, then stop the hole to keep in all the smoke. Let it stand for about two minutes, then dig out the nests and place them in a bag and afterwards put the bag in a kettle of boiling water and let it stay until the wasps are quite dead. Fowls will soon demolish the young wasps which the comb will very likely be full of. This is the most effectual plan I know of for destroying wasps' nests. *H. Hill, The Gardens, Glynn, Bodmin.*

The Hardiness of *Mandevilla suaveolens*.—When recently visiting the gardens at Battle Abbey, Sussex, I was much struck with the beauty of *Mandevilla suaveolens* growing outdoors on the wall of the old abbey, the plants being 20 feet high, and one mass of bloom. Mr. Bourgoine, the gardener, informed me it had been even much better than when I saw it. I also saw growing luxuriantly *Tropaeolum speciosum* and *tricolorum*, *Trachelospermum jasminoides* and the variegated variety, *Clintonia*, *Coronilla*, *Mutisia decurrens*, *Swainsonia*, *Lupageria alba* and *rosea*, and a fine lot of *Camellias*, all growing and doing remarkably well—which speaks well for the hardiness of those mentioned. *A. O.*

The Potatos Treated with Salus at Chiswick: Result.—In the *Gardeners' Chronicle* for April 14 last, p. 468, there is an account of the Potato-planting at Chiswick under my superintendence, and in your paper for July 14 last there is a description of the appearance presented by the Chiswick Potatos up to that date. The Potatos on the experimental plots were planted late in the season, viz., on April 5; they were planted in a cold stiff soil of loamy clay in unfavourable weather—it was raining nearly all the time—the worst position was purposely selected, viz., the spot where the murrain was so uncommonly bad in 1875, and the following varieties were chosen for experiment:—1, American Early Rose, on account of this Potato suffering more than any other in the 1875 attack, and being one of the worst to take the disease; 2, Lapstone, very subject to disease; 3, Bresee's Prolific, having the same character as the last; 4, Striped Don, often bad; 5, York Regents, having the same character as the last; and 6, Paterson's Victoria, a good Potato. No manure other than Salus was used. What I term the bad position was the one amongst the trees, the second position, in the open, I paid less attention to, it was moreover surrounded by large numbers of Potatos in close proximity with mine and untreated by me. I

originally intended to give the Potatos two applications of Salus, once at planting and once about the end of July. As the dampest and worst place was amongst the trees, I had the Potatos in that position treated a second time on July 16. I had an appointment for August 2 at Chiswick, when I intended to treat the plants in the open to a second application of Salus, but the sudden death of my father on July 31 prevented me from keeping the appointment, and so the Potatos in the open place were only treated once. I had no chance of getting to Chiswick again till Friday last, August 24, when all the Potatos planted by me were taken up in my presence. It will be noted that the early autumn storms had been allowed to expend themselves over the plants before they were taken up. In the open, where the plants were imperfectly treated and surrounded by others untreated, the following is the result:—Out of 276 tubers of Lapstone 14 showed traces of the disease. Out of 214 tubers of Paterson's Victoria 10 showed traces. Out of 518 Bresee's Prolific 20 showed traces. Out of 326 American Early Rose 22 showed traces. Out of 544 Striped Don 53 showed traces. Out of 473 York Regents 19 showed traces. In all there were 2213 sound tubers and 138 marked with the disease; therefore, 1 in 16 tubers showed traces of the murrain. In the ground amongst the fruit trees where the Potatos were so terribly destroyed in 1875 the case was different: the plants had two applications of Salus. The first row unearthed was Lapstone (the same as Premier), a very bad Potato for taking the disease. 382 tubers were unearthed, and after careful searching by four men only two tainted tubers could be found. I had little fear of the second row. Paterson's Victoria, 307 tubers were dug up out of this, only one with a trace of the disease could be detected. The third row was Bresee's Prolific, a very bad Potato for taking the disease; 413 tubers were unearthed, and after the most careful search not a single diseased tuber could be found. The fourth row was American Pale Rose, of luckless memory; this row produced 351 tubers. After being searched over by four persons with the utmost care not one infected tuber could be met with. The fifth row was composed of Striped Don, a Potato very subject to bad attacks of the murrain; the row produced 455 tubers; on carefully looking over these, eleven were found to be tainted. The sixth and last row belonged to York Regents, a Potato with a bad character; the row produced 546 tubers, and, after a most searching examination, only one tuber could be found as showing any trace of the murrain. Summary: The entire plot on the bad ground amongst the trees produced 2439 sound tubers, with only fifteen showing a trace of the murrain: average, one tainted Potato only to every 162 sound ones. Average of both plots taken together: one tainted Potato to 89 sound ones. Elsewhere in the garden American Early Rose and some of the Ashleaf varieties were about one tainted to two sound; one-third of the crop gone. Minier's Perfection was in a still worse plight. In the experiments at Rothamsted last year, where the produce was 56 tons, the result showed one tainted Potato in every nine. It must be borne in mind in reference to these figures that many of the tubers experimented upon by me were tainted at the time of planting. The Potatos were not weighed last Friday, and the new small seed tubers are included in the figures. The result of the experiment must speak for itself, and be estimated according to its value, whatever that may be; but I believe far better results would arise from better conditions. Without pretending to entirely prevent or perfectly cure the Potato disease, I think the Chiswick result clearly shows that it is quite as possible to keep the diseases of plants in check as it is the diseases of man and animals. *W. C. Smith.*

Self-Sown Potatos.—Referring to an article in your publication of the 18th inst. respecting self-sown seedling Potatos, I wish to state that I have seen an instance of such many years ago. Before the Potato blight was heard of, in the years 1842 and 1843, a field of mine was planted in succession without manure on the lea with the old Apple Potato, well-known as the best keeping Potato in the Dublin market, but now lost. In the year 1847 I had some of the clay—strong alluvial—brought into a flower garden to mix with the natural soil. A number of seedling Potatos sprang up from the seeds dormant since 1843. I had great hopes of thus being able to recover the lost Apple Potato, but when the plants were about 8 inches high, they were all cut off by the disease. I tried the experiment some years later, but without any result, with the same soil. *J. W., Dublin.*

Turf.—As the season for laying down fresh turf is at hand, a few hints may be acceptable, e.g., for making slopes and terraces. At this time I am mowing a quarter of an acre once a week, and shall now roll it as often. I shall select all the turf of this piece that is composed of Trefoil and white Clover for laying down the slopes, for, unless the turf is of good

quality, the slopes will always look bare and ragged. Two years since I commenced mowing and rolling a rough field for an extensive plantation and flower garden; at the same time I manured it with the following artificial composition:—One part guano, one Lawes' grass manure, and one of common salt. I selected these ingredients many years since for all grass land, and have never since had a bad crop of hay. The guano aids the growth, the grass manure encourages good quality, and the salt controls the whole, as well as keeps the earth moist. What with rolling, mowing, and manuring the field above alluded to I have now one of the finest pieces of velvet turf, chiefly of white Clover and Trefoil. I am using the Excelsior lawn mower, the best of all; it is wonderfully light in work, and the rapid action and weighted blades give so much momentum that, like the fly-wheel of a machine, it causes all the impediments to be overcome. I can strongly recommend it now that some improvement has been made in the shape of the cogs of the wheels. In laying down turf I do not at all object to some sand being mixed with the earth, the fibres of the turf root into it well, and the soil is not so apt to crack afterwards. Coal ashes some people use, but I find them poisonous to grass; not so wood ashes, nothing is better to produce a fine quality. Next week I will mention some other uses I put turf to. *Observer.*

Melon Growing at Longford Castle.—Mr. Ward, of Longford Castle, in your issue of August 18, gives an account of his Melon growing for the information of your readers. Will he kindly answer the following questions:—1, the length and breadth of his lights; 2, how many plants he has in each light; 3, does he mean sixteen fruit per light for each crop, or for all five crops; 4, how many were fit for the table, and how about flavour? From the first week in May to August 18 is fifteen weeks, and to finish five crops in fifteen weeks leaves three weeks for each crop. To flower, set, and swell and ripen a crop of Melons in twenty-one days, and that without much sun-heat, is quick work even in these fast days. *G. F. Didymus, Manchester.*

The Season and the Crops.—It is difficult to imagine a more disastrous report than that which has appeared lately in the pages of your journal as to the fruit crop of 1877, including too in this instance in the majority of cases the failure of that most useful fruit, the Apple. The opinions expressed in your columns as to the cause of that failure have well hit the mark, when they ascribe it not so much to the influence of frost as to the long period of dull, wet weather that we experienced during the blooming season, accompanied at intervals with high driving winds. The present state of vegetation in many places along our south coast bears testimony to the hurricane that swept over us late in the spring, checking and often destroying the young and tender growths. With such testimony before us, would it not be well to take into careful consideration, as one of the essential points for securing a good crop of Apples, the strong advisability of greatly increased protection for our orchards, to shield us not only from the biting north-easters, but also from the terrific gales of wind and rain which assail us occasionally from south-west and west? Belts of trees around the Apple orchard (always remembering not to bring them in too close proximity to your fruit) will render very effectual aid towards securing a good crop of fruit. Can you spare me the space to advocate briefly one more consideration that will help us to obtain the desired result, and that is, as much attention as we can possibly give to the judicious thinning of the fruit. I know from experience that where large quantities are grown it is a matter of impossibility to do much in this way, but when we see trees heavily laden one year and comparatively bare the next, it becomes evident that the removal, as far as practicable, of a portion of your fruit this year, will be conducive to the growth of the tree, and better development of fruit buds for next year's crop. *B.*

Root Pruning.—I was more than pleased to find root pruning (see p. 166) brought again before the attention of your readers. I consider it a most important subject, although my method differs widely from that detailed by "E. W." Yet when I practised it, some years ago, I found the greatest advantage in every respect; so successful was I that I prided myself in having almost any tree under control. Not only were the trees in the most beautiful health of foliage, thick, leathery in texture, a very dark green in summer, and in autumn fading off either light or dark, according to the variety, but they varied from the most beautiful crimson in some years to the palest lemon colour, but clear throughout, with no dark spots, and no leaves fading off from green to brown. When you have trees like this, you have a chance against frost and other evils, for flowers the following spring correspond with leaves of the previous summer and autumn. The wood has had such an opportunity of ripening that every bud is as if shielded

by so many scales. Then the fruit is so abundant as to require very severe thinning, and ripen to perfection, having the most beautiful tints on the side next the sun. I hope this matter will be most thoroughly gone into. After all that has been said by Mr. Hibberd and others against pruning, by attention to the roots, with the addition of proper nutriment, &c., you will need little pruning. *George Lee, F.R.H.S.*

The Thunderstorms and the Potato Crop.—It would almost seem a libel on common sense to revive the electrical theory of the Potato disease after Mr. Worthington Smith's lucid and exhaustive demonstrations and illustrations, in which all the disastrous effects are so clearly brought home to the *Peronospora infestans*. But, granting all that Mr. Smith has so well proved, it does nevertheless seem that an electrical state of atmosphere, and all that such state involves in the way of heat and moisture, and perhaps even electricity itself, is the most active agent in arousing the resting-spores of the *Peronospora infestans* into a state of such intense activity as to convert thousands of tons of sound Potatoes into mere masses of putrid corruption within a few days. That is the sad sight, these are the heart-breaking facts that have been forced upon our notice within the last fortnight. Before the thunderstorms the Potatoes were sound, after them they have become a complete wreck. The destruction has been more sudden and complete than it has for a dozen or more years, in fact it threatens to be universal—not a garden or field, not a single plant has escaped the scourge. The stench of the rotting haulm pollutes the atmosphere. Every sound Potato snatched for a meal from the rotting masses is so far infested as to give out the most unpleasant odours in cooking. The rain it raineth every day, or if it clears up one day it raineth the harder the next to make up for the cessation, and the atmosphere is close. On the heels of such rain the disease stalks abroad over field and garden, and causes them to reek with the disease. The common people say the thunder and the rain carry the disease. Assuredly they are right—but the resting-spores? Well, I admit all that, and am grateful indeed to Mr. Smith for making it all intelligible. But the resting-spores are harmless enough; it is the active growth of the spores that causes the mischief. The spores at rest are like a barrel of gunpowder in store in a safe place; they are as harmless as a barrel of sand, but bring fire in contact with it and it blows up the house. It is so in measure with *Peronospora infestans*. It abounds in numbers beyond calculation; I fear there is little hope of sensibly reducing these numbers. They are powerless for mischief till the thunderstorm, the muggy, close atmosphere, the lightning, converts from the passive into the active state, and then farewell to the Potato crop if these favourable conditions for the growth of the *Peronospora* last long enough for the destruction of the Potato. As to combating the enemy with Salus or aught else when it is in full activity, as well dash water on a barrel of gunpowder after the match has touched it. What fire is to the powder a muggy atmosphere that follows the trail of thunder through the sky is to the other. In fact, Mr. Smith's Salus dressings are meant to deal with the disease in its weakest, that is, its resting state. It is powerful, and probably kills all the spores in the Potato itself. But it is to be feared that the earth is sown thickly with such spores. The whole of our seed Potatoes were carefully dressed with Salus. At the first symptom of disease on early crops in the neighbourhood we lifted ours—a capital crop—and dressed all the late ones overhead with Salus. As far as appearance goes it has had but little effect. A good many of the early ones are now going since lifted. We fear we were a few days too late, and the late ones dressed overhead have also lost their tops like the others. It must, however, be stated that the whole of our ground has been potatoed for several years, and was probably full of the spores of *Peronospora*, so that though we probably started with clean seed they were planted in a foul bed. The weather, too, all through August has been the worst we ever remember for the Potato disease. A succession of thunderstorms of unusual severity, with enormous rains, dull weather, and little or no sun—weather made for the increase and multiplication of all forms of fungus life from the *Peronospora* upwards. The stimulating powers of Salus have also been most marked in many cases. Not only have the plants been abnormally strong, but after being cut down by the May frosts they pushed afresh with a rapidity, and tubered with an abundance, that I never remember to have seen equalled. I certainly intend to try Salus again, if any Potatoes are left to try it upon. I have found it most useful and effectual in arresting disease, and curing it, on Melons; it is an excellent stimulus for Potatoes and Hops, also may have proved positively deterrent. It has, however, possibly been overpowered by the season this year—a season the most favourable for the development of the Potato disease that we have had for full twenty years or more. I write in the midst of a steady downpour of warm rain, which has continued with hardly a

moment's intermission for twenty-four hours. *D. T. Fish, August 27.*

An Early Frost.—It may possibly interest some of your readers to know that on the night of August 23 (the night of the moon eclipse) we had a sharp frost here. The ground was perfectly white in the morning, and covered with a hard rimey frost, cutting the Vegetable Marrows all to pieces, the leaves of these being completely destroyed, and quite black. The young growths on a large piece of *Rhododendron ponticum* were browned as if they had been scorched. *John Staudish & Co., Royal Nurseries, Ascot, Berks.* [We have also had reports of frosts on the morning of the 24th ult. from near Richmond, and, in fact, all round London, and in the neighbourhood of Canterbury. *Eds.*]

Reports of Societies.

Royal Horticultural: August 24.—FRUIT COMMITTEE.—Henry Webb, Esq., V.J., in the chair. The meeting was held at the Society's garden, Chiswick. The collection of Tomatos, which have been grown in pots under glass, were first examined. The collection is represented by over sixty differently named varieties, two plants of each being grown. These the committee had arranged into classes as distinct in appearance, and amounting in all to thirty-one, which number may, however, be still further reduced or increased when further examined in comparison with those growing in the open air. These Tomatos at the present time are most interesting, and well worthy of inspection. The smallest variety is represented by Red Currant, of about the same size as a Currant; the largest variety is the Trophy, the earliest is the Early Gem, and the latest *D. Lay's*, which is of little value. First-class Certificates were awarded to Little Gem (Bliss), a medium-sized, round, deep red variety, very free-fruited, and very early; to New Improved (Vick), a large smooth ovate variety of a distinct rosy crimson colour, free-fruited; to Vilmorin's Large Red (Vilmorin), a very large slightly-ribbed variety and wonderful cropper; to Trophy (Carter & Co., Veitch, Wheeler), an exceedingly large nearly smooth red variety, of fine appearance, and late. Hathaway's Excelsior was found to well merit the Certificate that was awarded to it some time ago; also Green Gage (Carter), as being by far the best yellow variety. Conqueror, One Hundred Days, and Portsmouth, amongst the new varieties, were greatly admired.

The collection of cordon-trained Peaches and Nectarines on open wall were next examined. These trees, which have this season done good service, are in perfect health, and many of them are bearing heavy crops. Prominent amongst all others stands the Lord Napier Nectarine, which was awarded a First-class Certificate. The fruit is very large, roundish oblate, of a deep, dark purplish colour; the flesh is pale throughout, of rich and excellent flavour, having a dash of the Stanwick in it. It is of fine constitution, and a free bearer.

Turnips were next examined. Of these a very extensive trial has been made. The earliest varieties were found to be the American Strap-leaf, white and red-topped. This is an exceedingly fine Turnip, and completely takes the place of the old White Dutch, which seems to be almost worn out; at least, no true or good stocks of it have been grown here. Following these come the Early Red-top, the Red Globe, and the Early Six-weeks or Snowball, which has numerous synonyms. This is the main crop garden Turnip, and the finest of all. Of other varieties—all good enough in their season, but including no novelties—were noted a very good stock of the Long Vertus, pointed-rooted, which comes in very early, and is much used in France, although not in this country; the Round Black or Chirk Castle, an excellent autumn sort; the Yellow Finland, Yellow Malta, Orange Jelly, &c. The whole of those dry-fleshed Turnips—as the Teltauer and others, so esteemed in some parts of the Continent—proved a failure, as well as many of the varieties generally grown for field culture. A later sowing of Turnips has been made, which will be in due course examined. The collection of Savoys, it may be mentioned, is now nearly ready for inspection.

FLORAL COMMITTEE.—Mr. John Fraser in the chair. This meeting was held at Chiswick, on August 27. The committee proceeded with the examination of the Zonal Pelargoniums, of which there is a large collection planted out this season. Many of the sorts have suffered severely from the recent heavy rains, but the following varieties, being in excellent condition, were deemed worthy of First-class Certificates, viz.:—Excelsior (Denny), scarlet, with distinct white eye; Charles Smith (Pearson), dark scarlet; Mrs. Huish (Pearson), magenta-scarlet; Portia (Denny), magenta-scarlet; Mabel Eden (Pearson), light magenta; Lais (Denny), magenta-scarlet; Mrs. Holden (Pearson), rosy pink; Mrs. Lancaster (Pearson), rosy pink; Lord Giffard (George), bright

scarlet. Among the older varieties Triomphe de Stella, Golden Harry Heover, Vesta, Rose of Summer, Claude de la Meurthe, Arthur Pearson, Princess of Wales, Mrs. Turner, Christoe, Cleopatra, Lady Emily, and Snowdon were conspicuous.

The collection of Pelargoniums, consisting of all the newer varieties which have this season been grown under glass, was then examined, and the following, being considered very suitable for pot culture, were awarded First-class Certificates—viz., Miss Wakefield (Pearson), orange-scarlet; Louis (Pearson), rosy purple; Lustrous (George), very bright scarlet; Lady Eva Campbell (Pearson), salmon; Mrs. Pearson (Pearson), bright orange-scarlet. Among other varieties Thibe, Charles Smith, Miss Strachan, Lizzie Brooks, Rebecca, Blanche Gordon, and Lord Zetland were especially noticeable.

The double Pelargoniums, consisting of a selection of the best varieties of last season and new sorts received during the present year, were then examined, and First-class Certificates awarded to the following—viz., Député Aneelon (Lemoine), deep magenta-rose; and L^e Nord Est, bright scarlet. Madame Thibaut, Noemie, C. Glym, Auguste Villaume, Meteor Flag, Mrs. Trevor Clarke, Madame Amiljo Ballet were also very fine.

Asters.—A large collection of these now in full bloom was then examined, and the following were Highly Commended as being excellent stocks, viz., Pompon (Dippe Bros.).—Of erect moderately bushy habit, producing very close compact heads of flower. Diamond (Haage & Schmidt). This seems to be a larger and more vigorous-growing variety of the Pompon.—Dwarf Chrysanthemum-flowered (Dippe Bros.; Carter & Co.)—This is perhaps the best variety of any for general use, never exceeding 10 inches in height, and yielding in great profusion very large and well-formed flowers. Victoria.—This to all appearance seems to be a tall-growing variety of the Chrysanthemum-flowered. Bitteridge's Exhibition Quilled.—A very distinct and pleasing variety, throwing the flowers well up; and, being of a hardy constitution, does not seem to be affected by rough weather. A full report on these will appear in the Society's Journal.

Dianthus.—Of these beautiful annuals a very large collection has this season been grown, and on examination the following received First-class Certificates, viz.:—Heddwigii hybridus flore-pleno (Benary), Heddwigii laciniatus (Benary), Heddwigii hybridus atropurpureus (Benary), chioensis flore-pleno (Benary), imperialis flore-pleno (Benary), Heddwigii plenissimus splendens (Haage & Schmidt), and Heddwigii (Benary).

The National Carnation and Picotee Society held its fourth and final exhibition for the present season at the Drill Hall, Peel Park, Bradford, on Wednesday and Thursday, August 22 and 23, and it proved a worthy finale to a very interesting series of shows. Late, however, as was the date, it was too early, in this most unpropitious of all unpropitious seasons, for many of the growers of the hill districts of the North, and entirely so for the cultivators of Newcastle and its neighbourhood, who failed to produce even a solitary specimen. Of the collections from which contributions were received many had suffered grievously from the untoward weather preceding the day of show, and thus the show itself was shorn of the proportions which had been expected; but though of less extent than the generality of displays of the Carnation and Picotee in the North, the quality of the specimens produced more than compensated for this comparative paucity of number. Mr. Simonite, indeed, the popular and affectionate "Ben" of his fellows and familiars, fairly surpassed himself, and never did the writer see a finer collection of twelve Carnations, than that produced by him, and which so worthily obtained the first place. Ten of the twelve blooms were simply perfect specimens alike of good growth and artistic management—never to be forgotten by eyes permitted to feast upon their beauties; whilst Mr. Lord, Mr. Rudd, Mr. Bower, and some other contributors followed closely upon his heels. In Carnations, Mr. Simonite's Samuel Cooper, S.B., a new variety in the way of Admiral Curzon, but, as seen, even superior to that glorious old variety, was, by unanimous acclaim, selected as the premier bloom of the whole exhibition; whilst in Picotees a similar honour went to Mr. Lord, for a fine specimen of his Zerlina, purple-edge, a lovely flower of the highest properties and exquisite purity.

First-class Certificates were awarded to Mr. Lord, for his rose-edged Picotee Miss Horner, a variety in the style of Edith Dombain, but with a brighter marginal colour, and a white ground, which is "purity personified;" and to Mr. Simonite, for his light-edged purple Picotee Rosalind, of which it may be sufficient to say it sustains and advances the repute the raiser has attained for excellence in this class. Of varieties now generally distributed there were fine examples in Carnations of Admiral Curzon, Lord Napier, Mars, Mercury, and True Briton, S.B.'s; Eccentric Jack, John Simonite, Lord Raglan, Lord

Milton, and Marshal Ney, C.B.'s; Falconbridge, James Taylor, and Sarah Payne, P. B.'s; Dr. Foster, James Douglas, Juno, and Squire Meynell, P.F.'s; Clipper, John Bayley, James Cheetham, and Sportsman, S.F.'s; Cleopatra, John Keet, Rose of Stapleford, and Sibyl, R.F.'s; and in Picotees, red-edged, Clara, John Smith, Miss Small, Mrs. Bower, Mrs. Dodwell, Master Norman, and Wm. Summers; purple-edged, Alliance, Ann Lord, Alice, Chanticleer, Mary, Minnie, Mrs. Douglas, and Zerlina; and in rose-edged, E'hel, Fairy Queen, Mrs. Allcroft, Mrs. Lord, and Miss Wood. Annexed is the award of the judges:—

Class A. 12 CARNATIONS (dissimilar).—1st, Mr. B. Simonite, Rough Bank, Sheffield, with John Simonite, James Douglas, Samuel Cooper, Simonite; S.B., Sportsman, Cleopatra, Hartley; R.F., Curzon; Seedling R.F., James Taylor, Mercury, Clipper; Seedling C. B., and James Cheetham. 2d, Mr. George Rudd, Undercliff, Bradford, with Mercury, Juno, Garibaldi, Mary Ann, Mayor of Nottingham, Lord Milton, James Carter; R.F. (Adams), Sarah Payne, True Briton, John Bayley, Marshal Ney, and Admiral Curzon. 3d, Mr. Samuel Hartley, Headingley Nursery, near Leeds, with Falconbridge, John Keet, Lord Milton, Lord Derby; P.F., Mars, Elizabeth; S.F., Cleopatra, Admiral Curzon, Rose of Stapleford, James Taylor, Mr. Battersby, and Squire Meynell.

Class B. 12 PICOTEES (dissimilar).—1st, Mr. B. Simonite, with Mrs. Dodwell, Mrs. Slaek, P.P. (Simonite); seedling Lt.P., Edith Dombain, Rosalind; Lt. Purple (Simonite), John Smith; Seedling H.S., Mary, Mrs. Niven; Seedling Heavy Scarlet, Zerlina, and Seedling Heavy Scarlet. 2d, Mr. Rudd, with Alliance, Miss Wood, Ann Lord, Robert Scott, Rev. F. D. Horner, Mrs. Niven, Thomas Fleming; Lt. Rose, Miss Lee; medium red-edged, Unknown, John Harrison, Mary, and J. B. Bryant. 3d, Mr. Samuel Hartley, with Master Norman, broad heavy-edged red; Bertha, Mrs. Gibbons, John Harrison, Mrs. Hanaford, Mrs. Keynes, Fairy Queen, Norfolk Beauty, Brunette, Princess Alice, Mrs. Little, and John Smith.

Class C. 12 CARNATIONS (9 dissimilar).—1st, Mr. John Fletcher, North Bierley, near Bradford, with John Keet, James Douglas, Clipper, Juno, Falconbridge, Admiral Curzon, Squire Meynell, James Carter, James Merryweather, Lord Milton, Sarah Payne, and Lord Napier. 2d, Mr. Samuel Hartley, with Lord Milton, Squire Meynell, Mars, Cristagalli, Eccentric Jack, Elizabeth; S.F., Mary Ann, Lord Napier, Admiral Curzon, John Keet, Mars, and Clipper.

Class D. 12 PICOTEES (9 dissimilar).—1st, Mr. Robert Lord, Todmorden, with John Smith, Ann Lord, Zerlina, Ann Lord, Mrs. Lord, Rev. F. D. Horner, Miss Horner, Miss Horner, Alice, Miss Horner, and Miss Small. 2d, Mr. John Fletcher, with Alliance, Mrs. Love, rose-edged; John Harrison, Miss Wood, Beauty of Pimstead, John Harrison, Miss Wood, Alliance, Leonora, Clara, Bower, light-edged red, Miss Wood, and J. B. Bryant. 3d, Mr. Samuel Hartley, with Mrs. Gibbons, Fairy Queen, Master Norman, Bertha, William Summers, Mrs. Allcroft, Fanny Helen, Mrs. Gibbons, Mrs. Bower, Robin Hood, Alliance, and Master Norman.

Class E. 6 CARNATIONS (dissimilar).—1st, Mr. Thomas Bower, Little Horton Green, near Bradford, with Sibyl, Lord Raglan, Eccentric Jack, Clipper, Admiral Curzon, and Squire Meynell. 2d, F. Bateman, Esq., Park House, Low Moor, Bradford, with Mayor of Nottingham, John Keet, James Taylor, Admiral Curzon, and Juno.

Class F. 6 PICOTEES (dissimilar).—1st, Mr. Thomas Bower, with Chanticleer, Minnie, Ethel, Alice, Zerlina, and Mrs. Dodwell. 2d, F. Bateman, Esq., with John Harrison, Mrs. Dodwell, Mary, Mrs. Allcroft, Mrs. Forester, and Beauty of Plumstead.

SINGLE SPECIMENS.

CARNATIONS: Scarlet Bizarres.—1st, Admiral Curzon, Mr. B. Simonite; 2d, Admiral Curzon, Mr. G. Rudd; 3d, Admiral Curzon, Mr. B. Simonite; 4th and 5th, True Briton, Mr. R. Lord. **Crimson Bizarres.**—1st and 2d, John Simonite, Mr. B. Simonite; 3d, Seedling, Mr. B. Simonite; 4th, Lord Milton, Mr. S. Hartley; 5th, Lord Milton, Mr. John Fletcher. **Pink and Purple Bizarres.**—1st, James Taylor, Mr. B. Simonite; 2d, Seedling, Mr. B. Simonite; 3d, James Taylor, Mr. B. Simonite; 4th, James Taylor, Mr. George Rudd; 5th, Falconbridge, Mr. George Rudd. **Purple Flakes.**—1st, Dr. Foster, Mr. R. Lord; 2d, James Douglas, Mr. B. Simonite; 3d and 4th, Squire Meynell, Mr. G. Rudd; 5th, Lady Peel, Mr. B. Simonite. **Scarlet Flakes.**—1st, Sportsman, Mr. B. Simonite; 2d, Clipper, Mr. Robert Lord; 3d, Seedling, Mr. B. Simonite; 4th, Clipper, Mr. Thomas Bower; 5th, Sportsman, Mr. B. Simonite. **Rose Flakes.**—1st, Seedling, Mr. B. Simonite; 2d and 3d, John Keet, Mr. Robert Lord; 4th, Seedling, Mr. B. Simonite; 5th, John Keet, Mr. R. Lord.

PICOTEES.—Red, heavy-edged.—1st and 2d, Master Norman, Mr. S. Hartley; 3d, Mrs. Dodwell, Mr. B. Simonite; 4th and 5th, J. B. Bryant, Mr. B. Simonite. **Red, light-edged.**—1st, Miss Sharp, Simonite, Mr. B. Simonite; 2d, Wm. Summers, Mr. John Fletcher; 3d, Wm. Summers, Mr. George Rudd. **Purple, heavy-edged.**—1st, Mrs. Slaek, Mr. B. Simonite; 2d, Alliance, Mr. B. Simonite; 3d, Mrs. Slaek, Mr. B. Simonite; 4th, Mrs. Niven, Mr. B. Simonite; 5th, Mrs. Douglas, Mr. B. Simonite. **Purple, light-edged.**—1st, Rosalind, Mr. B. Simonite; 2d and 3d, Ann Lord, Mr. R. Lord; 4th, Seedling, Mr. B. Simonite; 5th, Seedling No. 28, Mr. R. Lord. **Rose, heavy-edged.**—1st, Miss Horner, Mr. R. Lord; 2d, Seedling, Mr. B. Simonite; 3d, Miss Horner, Mr. R. Lord; 4th, Flower of the Day, Mr. John Fletcher; 5th, Juliana, Mr. S. Hartley. **Rose, light-edged.**—1st, Mrs. Allcroft, Mr. R. Lord; 2d, Ethel,

Mr. B. Simonite; 3d, Fairy Queen, Mr. S. Hartley, 4th, Miss Wood, Mr. Jno. Fletcher; 5th, Miss Wood; Mr. G. Rudd.

First-class Certificates, not less than two blooms being exhibited, were awarded to Mr. Robert Lord, Hole Bottom, Todmorden, for his heavy-edged rose Picotee Miss Horner; and to Mr. Ben. Simonite, Rough Bank, Sheffield, for his light-edged purple Picotee Rosalind.

The premier prize for the best Carnation selected from the entire exhibition was awarded to Mr. B. Simonite for his scarlet bizarre Samuel Cooper, a new and superb variety, with the rich colours and quality of a fine Curzon, though quite distinct and more definitely marked. The premier prize for the best Picotee, also selected from the entire exhibition, was awarded to Mr. Robert Lord for a lovely specimen of his fine purple-edged variety Zerlina. E. S. Dodwell.

Battle Horticultural: August 23.—This show was held in the grounds of Battle Abbey, kindly lent by the Duke of Cleveland, and a more beautiful and suitable spot it would be impossible to find. In the early part of the day rain fell in torrents, but it fortunately cleared up, and by the time the gates were opened the sun came out brightly, and the rest of the day was all that could be desired. Stove and greenhouse plants both foliage and flowering were well represented, also Ferns. The flowering and fine-foliage plants sent by Mr. Gilbert, Hastings, would have done credit to any of our London shows. Fruit and cut flowers were also well represented, especially the fine examples of Muscat of Alexandria and Black Hamburg, shown by Mr. Allen, gr. to J. Brassey, Esq., Norman House, who also showed, some of the best examples of Adiantum it has been our good fortune to meet with. They were shown in 24-pots and measured over 3 feet through. In the ladies' tent novelties recently brought from China by Mr. Brassey were exhibited in the shape of Euphorbia splendens trained to represent Chinese junks, and specimens of the Banyan tree said to be eighty years old, trained representing Chinese temples: these attracted great attention and were much admired. The cottagers' classes were well represented, competition being very strong; some of the plants, flowers, and fruit exhibited would have made some of our professionals blush. (From a Correspondent).

Sevenoaks Horticultural: Aug. 23.—Favoured with beautiful weather, this Society held its ninth show on the above date, under very encouraging circumstances. Having left the old selected grounds, the committee, thanks to the liberality of the Right Honourable the Earl Amherst, pitched their tents, and made an excellent and varied display, in Montreal Park. This domain is of the most picturesque type. The ground is excessively undulated, the old timber very fine, whilst the view from the terrace gardens so kindly thrown open afford, on all sides around, pictures which belong, perhaps, to Kent alone. The Wellingtonias, draped to the ground upon the lowlands in intimate association with a meandering watercourse, add greatly to the charm. This part of the garden is ably cultivated in the good old style. Tulip trees, Venetian Sumachs, Magnolia pumila, &c., here meet the eye in fine masses, as well as such a mass of St. John's Wort as we have never before seen cultivated.

The show itself was quite up to the average, the only falling off observable being in connection with Plums, Apples, and Pears, this being a very favoured locality, especially for the former. The stove and greenhouse plants, Ferns, Fuchsias, &c., occupied one huge tent, while others were set apart for cut flowers, fruit, table decorations, &c., and the cottagers' productions.

To W. Spottiswoode, Esq., Coombe Bank (Mr. James Bolton, gr.), was awarded the premier prize for eight distinct varieties of exotic flowering and fine-foliaged plants, amongst which were very excellent examples of Ixora Williamsii, Croton Weismanni, Allamanda Hendersoni, the good old Clerodendron fallax, &c. Mr. Spottiswoode also took 1st prizes for a collection of cut flowers, stove and greenhouse; cut Phloxes, six ornamental-foliaged plants, out-door Peaches, vegetables, &c. H. B. Mildmay, Esq., Shoreham (Mr. Burt, gr.), won 1st prize for three Orchids and single specimen plants, showing in the first Vanda suavis, an excellent specimen of Thunia alba, and Cattleya violacea—his Saccolabium Blumei majus in the other class being fine in length of spike. The same exhibitor won, in a severely contested competition, for best three Caladiums, and the prize for collection of plants arranged for effect. In the above Caladium class Mr. G. Meakin was a very meritorious 2d; and in the class for effective arrangement of a group of plants, Messrs. Boulton (2d), Hubbard, Phillips, and Staples were all well worthy the high commendations they received. H. Oppenheim, Esq. (Mr. J. Staples, gr.), ably took 1st prize for collection of fruit, showing a splendid dish of Nectarines.

A. Swanzy, Esq., The Quarry (Mr. Blich, gr.), staged a splendid collection of flowering Begonias. Mr. Phillips being an admirable 2d with amongst

others a Begonia weltoniensis, about a yard in diameter. The former was also 1st with six exotic Ferns. Some three exhibitors here contested the award most strenuously, Messrs. Staples and Boulton staging very admirable collections, all of which were worthy of a higher award.

Captain Jackson, Moepeth (Mr. Phillips, gr.), was 1st with well bloomed Pelargoniums—still called Geraniums in this schedule, &c. Earl Stanhope, Clevering Park (Mr. Gray, gr.), was 1st with an excellent collection of vegetables. Mr. A. Henderson, Tonbridge, showed and was 1st with Pine-apple named Thorsley Queen. He also staged an immense fruit of the variety named Prince Albert, which in appearance resembles Black Prince. He had also the best black Grapes (Hamburgs), the best collection of three bunches distinct, &c. Colonel Warde, Squerrils Court, Westerham (Mr. Hubbard, gr.), showed the best dish of Peaches (indoors), consisting of Violet Hâtive and other meritorious exhibits. The Rev. T. T. Curteis (Mr. H. Huntley, gr.), obtained 1st prizes for Achimenes, which were splendidly grown and flowered—Boissier and Ambrose Verschaffel being especially good; also for one brace of Cucumbers. L. Lambarde, Esq. (Mr. J. Wood, gr.), had the best flavoured Melon—a splendid green-flesh.

The best white Grapes were those of J. S. Douglas, Esq. (Mr. A. Bashford, gr.)

In the classes for table decorations, which are always well contested, and with very superior taste, at this show, Mrs. Seale took 1st prize in the larger class with an arrangement light and highly pleasing, with but few flowers; Mrs. Fennell, Fairlawn, being a pretty 2d. Her chief effect was produced by an admixture of flowers of Mangles' Pelargonium, and the white leaves only of Acer Negundo variegata. For single epergne Mrs. Bolton was 1st, Mrs. Don being 2d. Wild flowers and three button-hole bouquets were carried by Mr. J. W. Seale. For hand bouquets, Mr. and Mrs. Boulton, Coombe Bank, each took a 1st prize, with very chaste arrangements. A very lovely bouquet was also staged by Mrs. Seale, consisting of Tuberoses and Plumbago capensis.

Mr. Seale, nurseryman, Sevenoaks, took 1st prizes for Asters, Gladioli, Dahlias and Roses, showing also an immense bank of splendid Dahlia blooms. Some of his best blooms were—Vice President, Mrs. Saunders, Fanny Sturt, Her Majesty, Criterion, Grand Duchess, Negro Boy, Chancellor, Henry Walton, James Service, &c. For twelve distinct Dahlias Mr. W. Godden was 1st. Mr. Cannell, Swanley, showed beautiful boxes of Pelargoniums New Life, Echinatum, and a sport from Echinatum called Spotted Gem, a most taking bloom for button-holes, &c. Mr. Cattell, Westerham, brought a collection consisting of Lilies, &c., whilst the display of maiden honey afforded from the apiary of J. M. Hooker, Esq., and produced in his Alexandra hives, deserves mention, as being so pure as to be free from speck or stain, the comb white, and honey transparent. *W. E.*

- AUG. 23.—A very fine bright day. Cool.
- 24.—A fine day. Cloudy after 3 P.M. Cool.
- 25.—Generally dull and cloudy, with frequent rain, accompanied with thunder and lightning. Vivid lightning in evening.
- 26.—A dull, cool, cloudy day. Rain fell in early morning.
- 27.—Overcast and dull throughout. Cool and windy. A little rain fell in early morning, and a few drops in afternoon at 1 evening.
- 28.—Overcast, dull, with thin rain till 10 A.M. Fine but cloudy after. Shower of rain at 8 P.M.
- 29.—A fine bright day, partially cloudy.

LONDON: *Barometer.*—During the week ending Saturday, August 25, in the suburbs of London the reading of the barometer at the level of the sea decreased from 29.95 inches at the beginning of the week to 29.78 inches by the morning of the 19th, increased to 29.85 inches by the evening of the same day, decreased to 29.57 inches by the morning of the 21st, increased to 29.71 inches by the night of the same day, decreased to 29.62 inches by the morning of the 22d, increased to 30.21 inches by the morning of the 24th, and decreased to 29.53 inches by the end of the week. The mean reading for the week at sea level was 29.83 inches, being 0.12 inch below that of the preceding week, and 0.18 inch below the average.

Temperature.—The highest temperatures of the air observed by day varied from 84.3° on the 20th, to 71.3° on the 25th; the mean value for the week was 72.4°. The lowest temperatures of the air observed by night ranged from 42.3° on the 24th to 63° on the 20th; the mean for the week was 55.3°. The mean daily range of temperature in the week was 17°, the least range in the day was 6.1° on the 25th, and the greatest 27.3°, on the 24th.

The mean daily temperatures of the air, and the departures from their respective averages, were as follows:—19th, 67°.9, +7°; 20th, 71°.1, +10°.3; 21st, 65°.3, +4°.6; 22d, 60°.7, +0°.1; 23d, 57°.5, -3°.6; 24th, 54°.7, -5°.9; 25th, 56°.8, -3°.7. The mean temperature of the air for the week was 61°.9, being 1°.3 above the average of sixty years' observations.

The highest readings of a thermometer with blackened bulb in vacuo, placed in sun's rays, were 137° on the 22d, 136° on the 21st and 23d, and 130° on the 20th, but on the 25th the reading did not rise above 83.4°. The lowest readings of a thermometer on grass, with its bulb exposed to the sky, were 30.2° on the 24th and 30.2° on the 23d; on the 20th 58° was the lowest reading. The mean of the seven low readings was 48°.

Wind.—The direction of the wind was S.W., and its strength brisk.

The weather during the week was fine, though showery and dull at times. There was frequent thunder and lightning during the whole day of Saturday, the 25th.

Rain fell on four days during the week; the amount collected was 1.69 inch, 1 inch of which fell during the early morning hours of Wednesday, the 22d.

ENGLAND: *Temperature.*—The highest temperatures of the air observed by day were 84.3° at Blackbeath, 81.4° at Bristol, 81° at Nottingham, and 80° at Cambridge; the highest temperature at Sunderland was 67°, and at Liverpool was 69°; the mean value from all stations was 74°. The lowest temperatures of the air observed by night were 37.4° at Bristol, 38° at Truro, and 38.3° at Nottingham; the lowest temperature at Portsmouth was 50°; the general mean from all stations was 42.3°. The range of temperature in the week was the greatest at Bristol, 43.3°, and the least at Liverpool, 19.1°; the mean range of temperature from all stations was 31.1°.

The mean of the seven high day temperatures was the highest at Blackbeath, 72.4°, and at Cambridge and Nottingham, both 72°; and the lowest at Sunderland, 62°. The general mean from all stations was 69.3°. The mean of the seven low night temperatures was the lowest at Eccles, 50.1°, and Sunderland, 51.3°; and the highest at Portsmouth, 57.3°; the mean value from all stations was 53.1°. The mean daily range of temperature in the week was the greatest at Nottingham, 20°, and the least at Liverpool, 9.2°; the mean daily range from all stations was 14°.

The mean temperature of the air for the week from all stations was 58.3°, being 3° higher than the value for the corresponding week in 1876. The highest was at Blackbeath, 62°, and the lowest at Sunderland, 55°.

Rain fell on every day in the week at Eccles and Hull, and on six days at most other places. The fall was generally large, and varied in amount from 3.4 inches at Liverpool, and 3 inches at Sunderland, to three-tenths of an inch at Portsmouth; and the average fall over the country was 1.3 inch.

The weather during the week was fine, but showery, and the sky was generally cloudy. A thunderstorm occurred at Truro on the 22d, and at Blackbeath and Hull on the 25th. Floods have been prevalent in different parts of the country during the week.

SCOTLAND: *Temperature.*—The highest temperatures of the air varied from 64° at Dundee to 60° at Paisley; the mean from all stations was 62.3°. The lowest temperatures of the air ranged from 35° at Perth to 44° at Glasgow; and the mean value from all stations was 39.3°. The mean range of temperature in the week from all stations was 22.3°.

The mean temperature of the air for the week from all stations was 51.3°, being 7° lower than that of England, and 5° lower than the value for the corre-

sponding week in 1875. The highest was 52.3°, at Glasgow, and the lowest 50.3°, at Paisley.

Rain.—The fall of rain was excessive everywhere, as will be seen from the following:—The amount measured at Edinburgh was 5.46 inches; at Paisley was 3.60 inches; at Perth was 3.52 inches; at Greenock was 3.13 inches; at Aberdeen was 2.92 inches; at Glasgow was 2.80 inches; and at Dundee was 2.40 inches. The average fall over the country was 3.3 inches.

DUBLIN.—The highest temperature of the air was 77.3°, the lowest was 38.3°, the range was therefore 39°, the mean was 57°, and the fall of rain was 1 inch.

JAMES GLAISHER.

Answers to Correspondents.

ANTS: *T. ♀.* Drown them out by immersing the pots in water for a short time. You must let them well drain afterwards though.

AZALEAS: *A Small Grower.* Azalea cuttings in a similar state to those enclosed will strike in a temperature of 70°, inserted in sand, and covered with a bell-glass, either with or without bottom-heat; but they will take longer to root, and not grow away so freely as if they had been put in sooner. The wood has got considerably harder than it ought to have been; if taken off three weeks ago they would have done better.

BOILERS: *E. W. S.* We know of no composition such as you allude to. If you keep the boilers constantly filled with water you need not fear their being injured by rust.

BOOKS: *Warwick.* Bradbury, Agnew & Co., Bouverie Street, Fleet Street, E.C.

INSECTS: *J. Mullins.* Yes, quite correct, as you will see by the accompanying illustration of the larva and perfect insect (fig. 58). The larva feeds on the Potato haulm, and the perfect insect will appear next

FIG. 58.—DEATH'S-HEAD MOTH AND CATERPILLAR.

month.—*Camjee.* We are not quite sure of this. Could you get us a specimen of the beetle that proceeds from it? *A. M.—A. Mel., Forres.* One of the smaller Cockchafer's—probably *Amphimalla solstitialis*. Remedy not known. *A. M.—A Constant Reader.* *Hylobius abietis.* Feeds on Conifers. *A. M.—C. E. F.* A species of *Eupteryx*, very near, if not identical with, one of the species described by Curtis as infesting Potatoes, *Eupteryx Solani*. It is one of the cuckoo spits, that do not make any spit. *A. M.*

CARNATION: *D. M.* Your seedling Carnation is certainly worth saving for its pretty colour and delicious Clove perfume, and if free flowering, as it appears to be, it is doubly worth growing for decorative purposes. There is nothing in the form of the flower to recommend it to florists, so that if you show it at South Kensington it should be in pots, not as cut blooms. The next meeting is on Tuesday, September 4.

CLEMATIS: *Amaleux.* We cannot name variety. Yours look like *lanuginosa*.

CUCUMBER TENDER AND TRUE: *J. H. & S. Teader* and True is neither a white nor a black spine, as Mr. Douglas had it originally; but the spines cannot be expected to come true every time from seed. When it does produce spines it is generally white with a black tip. If it comes white all the better; but being what is called smooth—that is, with few spines—the colour is not noticed much.

EVERLASTINGS: *A Subscriber.* Cut the flowers before they become fully expanded, on a dry sunny morning, and either tie them up in small bundles, and hang them up to dry in a cool shady place, or lay them thinly on shelves. The sealing-wax would do no good. After the flowers are dried, should you want them to expand a little more, place them in front of a slow fire for a short time.

LIQUID MANURE: *N. E. S.* You might easily ascertain the effect of the acid by trying the mixture on a few worthless plants. We should think if you were to dilute the liquid-manure well with water, and use it only in showery weather, you would not experience any annoyance from bad smells. If not, try a little chloride of lime.

NAMES OF PLANTS: *A. W.* *Viburnum Opulus*—the wild Guelders Rose.—*F. E. C.* *Lonicera Ledebourii*,

and Acer Negundo.—A. G. 1, Ipomopsis elegans; 2, Stachys Betonica; 3, Hieracium—a wretched scrap; 4, Teucrium scorodonia; 5, an Umbellifer—a miserable scrap; 6, Solidago virga aurea.—G. Thomson. Lastrea patens.—T. S. P. The Fern is Asplenium Hemionitis, alias A. palmatum. It is infested with thrips, which in your case would, perhaps, be most readily removed by two or three careful spongings of tepid water in which soft-soap has been dissolved. Fumigation with tobacco smoke, repeated at intervals of two or three days, will also destroy the thrips. If the insect is upon the young fronds they must be very carefully handled.—T. Phillpotts. Neither of the Fuchsias you mention, but the common F. virgata.

PASSION-FLOWER: T. J. It strikes easily from cuttings. RATING: An Old Subscriber. See p. 261.

TOMATO: T. J. Jackson's Favourite or Trophy. The latter is the largest, but the former the best.

TOMATOS IN VINEYRIES: S. Lloyd. The story that 'Tomatos grown on the back walls of vineyries are poisonous or injurious to the Vines, is sheer nonsense.

TUBEROSES: Warwick. We have never known Tuberoses do much good after the first time of flowering in this country. Like Hyacinths, they need to be prepared by open-air cultivation, and our climate is not suitable for maturing them as they require to be. Similar treatment as to soil and size of pot will answer for Hyacinths and Narcissus. Both require to have their pots well filled with roots before being subjected to heat. The same temperature, as also light, will answer for each during the time they are making growth.

WHITE PELARGONIUM: T. J. Snowdon.

Correspondents are specially requested to address, post-paid, all communications intended for publication to the "Editors," and not to any member of the staff personally. The Editors would also be obliged by such communications being sent as early in the week as possible. Correspondents sending newspapers should be careful to mark the paragraphs they wish us to see. Letters relating to Advertisements, or to the supply of the Paper, should be addressed to the Publisher, and not to the Editors.

FOREIGN SUBSCRIBERS sending Post-office Orders are requested to make them payable at the post-office, King Street, Covent Garden, London, and at the same time to inform the Publisher at the office of this Journal.

Markets.

COVENT GARDEN, August 30.

The market remains much the same as last week, the supply of home produce being short, with the exception of Nuts and Apples, for which there is a fair demand.

VEGETABLES.

Table with 2 columns: Item and Price. Items include Artichokes, Beans, Carrots, Cauliflowers, Celery, Chilis, Cucumbers, Endive, Lettuces, Mint, Mushrooms, Onions, Parsley, Peas, Radishes, Spanish, New Jersey, Salsafy, Shallots, Spinach, Tomatoes, Turnips, Vegetable Marrows, etc.

Potatoes.—Kent Regents, 100s. to 120s.; Kent Kidneys, 140s. to 160s.; Shaws, 100s. per ton.

FRUIT.

Table with 2 columns: Item and Price. Items include Apples, Apricots, Currants, Chrysanthem, Coriander, Dahlias, Eschscholtzia, Eucharis, Gardenia, Heartsease, Heliotrope, Jasmine, Lilies, Nuts, Oranges, Peaches, Pears, Pige-apples, Figs, etc.

CUT FLOWERS.

Table with 2 columns: Item and Price. Items include Achillea, Asters, Bouvardias, Calceolaria, Chrysanthem, Coriander, Dahlias, Eschscholtzia, Eucharis, Gardenia, Heartsease, Heliotrope, Jasmine, Lilies, Mignonette, Myosotis, Pelargoniums, Primula, Pyrethrum, Roses, Stephanotis, Stocks, Sunflower, Sweet Peas, Tropaeolum, etc.

PLANTS IN POTS.

Table with 2 columns: Item and Price. Items include Balsams, Begonias, Bouvardias, China Asters, Chrysanths, Clematis, Cockscombs, Coleus, Cyperus, Dracena terminalis, Ferns, Ficus elastica, Fuchsias, Heliotrope, Hydrangea, Liliuns, Mignonette, Myrles, Palms, Pelargon, Petunias, Roses, Solanums, Valotta purpur, etc.

CORN.

Trade at Mark Lane on Monday was firm, but with little animation in the trade, and as regards Wheat an attempt to establish a higher range of values did not altogether succeed. There was a small supply of new English Wheat, the best samples of which were worth 64s. per qr. Barley was quiet and unaltered, while the same prices prevailed for malt. Oats were from 37d. to 6d. per qr. dearer. Maize was steady, and in Beans and Peas no change was reported. Flour was firmer, in sympathy with the Wheat market, but in the absence of business prices were nominally as before.—Wednesday's trade was firm, but the more settled weather checked the tendency to improvement. Wheat was quoted nominally the same as on Monday. Barley was fully as dear, while Oats and Maize experienced a better trade on somewhat stiffer terms. Malt was taken off quietly, as also were Beans, Peas, and flour, and quotations were unaltered.—Average prices of corn for the week ending August 25:—Wheat, 63s. 10d.; Barley, 33s. 9d.; Oats, 28s. 4d. For the corresponding period last year:—Wheat, 45s. 4d.; Barley, 32s. 7d.; Oats, 28s. 7d.

CATTLE.

At Copenhagen Fields on Monday prices for beasts advanced a little on all descriptions, and a fair clearance was effected. The supply of sheep and lambs was unusually small; trade was active, at advanced rates, with an early clearance. The few calves on offer made a good price.—Quotations:—Beasts, 4s. 6d. to 5s. 4d., and 5s. 8d. to 6s. 2d.; calves, 5s. to 6s. 4d.; sheep, 5s. 8d. to 6s. 2d., and 6s. 8d. to 7s. 2d.; lambs, 7s. 4d. to 8s.; pigs, 4s. 4d. to 5s. 4d.—Trade on Thursday was steady, but not active. Beasts were in short supply, and sold quietly at the full prices of Wednesday. So also with sheep and lambs, of which about an average supply was on the stands. Calves were quiet and unaltered.

HAY.

At Whitechapel on Tuesday there was not much demand for fodder, and quotations were unchanged. Prime old Clover, 100s. to 137s.; inferior, 85s. to 95s.; good new Clover, 100s. to 126s.; prime old meadow hay, 90s. to 120s.; inferior, 70s. to 85s.; good new hay, 80s. to 100s.; and straw, 44s. to 56s. per load.—There was a moderate supply of hay and straw on sale on Thursday. Clover was scarce and dearer. With a fair trade prices for hay and straw were unchanged. Quotations:—Prime old Clover, 100s. to 140s.; inferior, 85s. to 95s.; good new, 100s. to 126s.; prime old meadow hay, 90s. to 120s.; inferior, 70s. to 85s.; good new, 80s. to 100s.; and straw, 44s. to 56s. per load.—Cumberland Market quotations:—Superior old meadow hay, 100s. to 126s.; inferior, 90s. to 98s.; new hay, 70s. to 100s.; superior old Clover, 130s. to 140s.; inferior, 100s. to 120s.; new Clover, 84s. to 120s.; and straw, 54s. to 60s. per load.

POTATOS.

The Borough and Spitalfields markets reports state that the supplies continue on a moderate scale, and trade on the whole remains steady. Kent Regents, 100s. to 130s. per ton; Essex ditto, 100s. to 115s.; Shaws, 70s. to 100s.; Kidneys, 80s. to 120s.—The imports into London last week were confined to the receipt of 2118 bags from Hamburg, and 1226 from Bremen.

COALS.

The trade at market on Monday showed no feature of special interest. On Wednesday a fair amount of business was done at the following quotations:—Walls End—Hetton, 20s.; Hetton Lyons, 17s. 3d.; Lambton, 19s. 6d.; Hartlepool, 19s.; East Hartlepool, 19s. 9d.; Hutton Henry, 19s.; Tees, 19s. 9d.

Estd. 1844. For the best List of Choice Hyacinths, Tulips, Crocuses, Narcissus, &c., see our Beautifully Illustrated

CATALOGUE OF DUTCH FLOWER ROOTS FOR Autumn, 1877,

Containing numerous fine Engravings and much Valuable and Original Information on the successful Culture of Bulbous-rooted Plants. Should be read by all intending purchasers before ordering. Post-free on application.

Our 21s. Collection (No. 7).

For outdoor or open border decoration, contains the following liberal assortment:—

- 25 Hyacinths, choice mixed
18 Polyanthus Narcissus, mixed
12 Narcissus Poeticus
12 double white
6 Campanelle Jonquils
25 Aemones, fine double
25 fine single
50 Persian Ranunculi, mixed
50 Turban Ranunculi, in 4 varieties
150 Crocus, in 6 vars.
20 Snowdrops
12 Tulips, scarlet Van Thol
12 Cottage Maid
12 Yellow Prince
25 double, mixed
12 Rex Rubrum
12 late mixed
12 Scilla amena
12 Lilium candidum
12 Spanish Iris
9 Herbaceous and Alpine Plants, WITH FULL CULTURAL DIRECTIONS.

Care, Packing, and Carriage Free to any Railway Station in England and Wales. Other Collections, 12s. 6d., 42s., 63s., and 84s. each.

From Mr. H. BENNETT, Belle Vue Crescent, Clifton, Bristol. March 10, 1877.

"I am glad to tell you that the Hyacinths, Tulips, and Crocus I had in the Autumn have given entire satisfaction, the flowers are splendid."

From R. PRONVCE, Esq., Bathgate, N.B. February 7, 1877.

"The Bulbs received from you in the Autumn have been particularly fine; some of the Hyacinths and Tulips now in bloom are large and beautiful, and have far exceeded any that I have had before."

DANIELS BROS., THE QUEEN'S SEEDSMEN, NORWICH.

TEA SCENTED ROSES.

SPECIAL CULTURE.

We have this season devoted nearly the whole extent of our Glass-houses to the Culture of Tea-Scented and other Roses, and are now enabled to offer plants of very superior quality.

PLANTS, in 5-inch pots, suitable for planting out, 15s. to 18s. per dozen.

extra size, in 6-inch pots, for Greenhouse, set with buds, 24s. per dozen.

extra size, in 8-inch pots, for Greenhouse, set with buds, 30s. to 36s. per dozen.

Half Specimens, 5s. to 7s. 6d. each.

NEW FRENCH ROSES of 1877, 30s. per dozen.

HYBRID PERPETUAL ROSES, established in 9 and 10-inch pots, now showing for bloom, 36s. to 42s. per dozen.

CRANSTON'S NURSERIES, KING'S ACRE, near HEREFORD.

WRIGHT'S ENDLESS-FLAME-IMPACT HOT-WATER BOILERS.

GUARANTEED

The most Powerful, the most Rapid, the most Economical, the Simplest, and the Cheapest in the World.

"The 'Boiler of the Future,' I have no doubt about this."—WM. THOMSON, *Tweed Vineyards.*

From the "Gardener," July, 1877.

WRIGHT'S PATENT

ENDLESS FLAME-IMPACT BOILERS.

"The first intimation I had of the existence of these boilers, or of their inventor, was a pamphlet I received through the post. Its perusal satisfied me that Mr. Wright had a sounder theoretical knowledge of the subject of heating water than any author I had ever perused. I also liked the construction of his boiler better than any I had previously met with. Mr. Lewin, gardener, Drumpellier, was represented as having fixed one of these boilers, and as bearing testimony to its excellence; and as I knew Mr. Lewin to be not only a good gardener, but a shrewd, clever man, I felt satisfied that the boiler must be of the excellence which my own knowledge of such matters led me to conclude it was from its construction.

"Having occasion to be in the neighbourhood of Glasgow last February, I went to Airdrie and called on Mr. Wright, who took me to the foundry in Glasgow where the boilers are manufactured. There he put one together in a few minutes, and a closer examination of it only strengthened my preference for it over all boilers I had previously seen. I ordered a 4-C boiler, which I have fixed to heat 2600 feet of 4-inch pipe in two early vineries. One, a Muscat-house, 200 feet long and 16 feet wide, is built and planted; the other will not be built till autumn; so that at present the boiler is only heating 1200 feet of pipe, which it does with a very small fire and the damper nearly close in, burning little more than half the coal used in any other boiler I have—and I have some of the most approved, both of my own and other people's designs.

"The result of the trial I have had of Wright's boiler is, that I have ordered four more, and will pull out all my other boilers as opportunity occurs, and replace them by his, with a view both of saving and efficiency.

"No doubt many will ask wherein consists the cause of the efficiency of this boiler over others? To explain this, it may be well to observe that when fresh coal is added to the fire of any other boiler known to the writer, the first process that goes on is the distillation of the gas from the new coal, and its rapid discharge, in advance of the flame, up the chimney and unconsumed. This is not only a great evil in itself, but to effect it the heat is extracted from the fire that was in the furnace when the fresh coal was added, and little or no benefit is got from the fire till the gas is up the chimney and the destruction of the carbon in the coal has begun.

"Many expedients have been adopted to prevent this loss; and no doubt careful stoking can do much in the case of large boilers for generating steam, where there is a long fire, and where the fresh coal is always added to the front of the fire, compelling the gas to pass over the red fire and get ignited; but in the case of boilers used for heating hothouses, this is not practicable, and especially with ever-changing stokers, who, as a rule, think if they throw a given quantity of coal on the fire no further care is needed. Now, in the case of Wright's boilers, distillation of gas takes place as in others, but it has no possible chance of escape unconsumed—for gas and flame are compelled to meet face to face, over and over again, ere they leave the boiler; consequently all the gas is consumed, and the heat from it made to impinge directly on the flat surfaces of the various sections of the boiler on its way upwards. Here lies the great secret of this boiler's power.

"What also adds not a little to increase the power of the boiler is the method adopted for supplying a hot-blast, by passing air from the front of the cast-iron stand on which the boiler is placed through an intricate passage, till it is discharged at the back of the ash-pit under the bars. This leads to the most perfect combustion of the commonest dress-coal. There is also an arrangement by which a hot-blast is thrown into the furnace through the furnace door. Then there is a moderate supply of air entering the furnace all round, where the first section is laid on the heater-jacket of the boiler; this has the same effect on the fire as the well-known Argand burner has on the lamp, giving a clear fierce flame. These boilers are made up of a series of simple castings, jointed by means of india-rubber rings, which allow them to expand and contract; therefore they are sure to be the safest of boilers."

—WM. THOMSON.

"Tweed Vineyard, June 14, 1877."

"I think yours the most perfect 'Heat Trap' yet invented."
—DAVID THOMSON, *Drumlanrig Gardens.*

For details and particulars as to the various sizes made, and prices, please see our pamphlet, entitled, "OUR BOILERS AND HEATING," which will be handed to all applicants, post-free.

We are prepared to supply **Thirty Different Boilers** of all powers, sizes, and heights, and can vary these to suit any particular situation or requirement.

NEW ENGLISH-RAISED SEEDLING ROSES.

MESSRS. BELL & SON, THE NORWICH NURSERIES,

Are now executing orders for their TWO NEW ROSES, raised at their Nurseries, and described and announced below. They have been thoroughly tested here before being sent out, and can be recommended with confidence as really distinct novelties.

CLIMBING ROSE "CATHERINE BELL."

Very large flowers of a deep rose colour, the backs of the petals a delicate silvery pink, of exquisite shape and very fragrant. It is very free-flowering, and of vigorous climbing habit, making shoots 6 feet to 8 feet long in one season. Figured in *The Garden*, March 18, 1876.

"Your Rose Catherine Bell is both *belle et grande*."—Rev. Canon Reynolds Hole.

Good Flowering Plants, in Pots, 10s. 6d. each.

COLOURED PLATES ONE SHILLING EACH.

HYBRID TEA ROSE "MRS. OPIE."

Bright salmon-rose, tea-scented flowers, with shell-like petals, a most distinct and novel shade of colour among Tea Roses. It will form a charming companion to Madame Falcot, and will be as extensively cultivated as that variety when well known. In flower from May to November. Figured in the *Floral Magazine*.

Good Flowering Plants, in Pots, 7s. 6d. each.

BELL AND SON, 10 & 11, EXCHANGE STREET, NORWICH.

STEVENS' TRENTHAM GREENHOUSE BOILER,
After long experience, has proved the most SIMPLE, ECONOMICAL, EFFECTUAL, and LASTING BOILER extant; recently improved.

Copy of a Testimonial.

"Messrs. SILVESTER. "Royal Exotic Nursery, King's Road, Chelsea, S.W.—Aug. 8, 1877.
"GENTLEMEN,—In reply to your enquiry as to our opinion of your Stevens' Trentham Boilers, we do not hesitate to pronounce them to be by far the best Boilers we have ever used. Our establishment is a very large one, and we have tested most of the various descriptions of Boilers which have been brought out from time to time. We originally commenced with our Trentham Boiler, and we have now *thirteen* of various sizes at work. "For certainty of action, economy in fuel, and freedom from breakdown, we have never had a Boiler at all equal to the Stevens' Riveted Trentham Boilers supplied by you, and we have never felt so little anxiety in connection with our hot-houses during the cold winter months as we do now.
"We are not in the habit of giving testimonials, but we think this may fairly be an exception to our rule, as the matter is one of such importance to the Gardening Public generally, and our experience has led us to form a very decided opinion.
"We are, Gentlemen, yours faithfully,
"JAMES VEITCH and SONS."

For Illustrations, with full particulars, apply to the Sole Makers, F. & J. SILVESTER, HOT-WATER ENGINEERS, &c., &c. Castle Hill Works, Newcastle, Staffordshire.

Our Boilers are the ONLY ones made with the sanction and under the inspection of the inventor, Mr. Stevens—all others being base imitations.

For Sale, a STEVENS' IMPROVED TRENTHAM WROUGHT IRON HORTICULTURAL BOILER, 6 feet long by 3 feet diameter, fitted with Inlet and two Outlet Pipes, Fire-door and Grate complete. For price and particulars apply to HILL AND SMITH, Brierley Hill Ironworks, Dudley.

CRITCHLEY'S PATENT HEAT REGULATOR,
AN APPARATUS FOR REGULATING THE HEAT IN HORTICULTURAL BUILDINGS.

A, Iron Box fitted up water-tight. B, Pipe or Supply of Water from Boiler. C, D, Pipes for Circulating Hot-Water. E, F, Pipes for Return of Water to Iron Box. G, Pipe for Returning Water to Boiler. H, I, J, K, Piston-Rods for Opening and Closing Valves.
The advantages of these Regulators are that houses may be kept at different degrees of heat, or the circulation of water and heat entirely stopped in one part and not in others. They may be fitted with as many valves as required, and are particularly adapted for forcing houses where top and bottom heat is used. They may be fixed in any part of the apparatus most suitable for working, without regard to the position of the Boiler.

The following Testimonial has been received:—
"Berkeley Castle, April 13, 1875.
"Gentlemen,—I am happy to inform you, now that the late severe winter is past, that the Hot-Water Apparatus erected by you does its work to my entire satisfaction. As to the two Heat Regulators, which represent thirty valves, I have had ample opportunities of practically proving them, and unhesitatingly admit they are far superior to any other valve; in fact, I think it the greatest improvement that has come out for horticultural purposes.
"I am, Gentlemen, yours truly, "R. H. CRONK, "Gardener to the Right Hon. Lord Fitzhardinge."
Estimates and Plans furnished for Warming Gentlemen's Mansions and Public Buildings. Orders attended to in any part of the Kingdom, and guaranteed to answer their intended purposes. Prospectus and Price Lists post-free.

ART-WITH-ECONOMY-APPLIED-TO-CONSERVATORIES

In consequence of the increasing demand for Conservatories, in which pure art is combined with moderate cost, T. H. P. DENNIS & Co. have been led to introduce designs of a character hitherto unknown. One of these designs, showing a house 22 feet 6 inches X 13 feet 6 inches, is annexed, and the result, as regards the extremely low price (which includes fixing, glazing, painting, carriage, &c.), has been attained only by special machinery and a system of interchangeable parts.

T. H. P. DENNIS & Co. are also prepared to provide and fix Hot-water Heating Apparatus and Horticultural Buildings of any dimension or description.

Full-sized specimens of Greenhouses, &c. and Hot-water Apparatus in work, can be inspected at Mansion House Buildings, London, E.C.

Gentlemen waited upon at their residences by experienced designers.

Estimates and Plans free.

J. SMITH, The Royal Label Factory, Stratford-on-Avon.

Oil Paint No Longer Necessary.

HILL AND SMITH'S BLACK VARNISH for Preserving Ironwork, Wood, or Stone. This Varnish is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requires no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received, which **HILL & SMITH** will forward on application. Sold in casks of about 30 gallons each, at 1s. 6d. per gallon, at the Manufactory, or 1s. 8d. per gallon carriage paid to any Station in the Kingdom.

UNSOLICITED TESTIMONIAL RECEIVED MAY 3, 1877.
"The *Rylands, Alderly Edge, Manchester*.—Messrs. Hill & Smith.—Sirs,—For some 20 years I have used your 'Black Varnish,' and shall be glad if you will forward me another cask, as I consider it the best thing known for the preservation of all outdoor work, either wood or iron, that requires to be painted.
—Yours respectfully, **ALFRED LOWE, J.E.**
Apply to **HILL and SMITH**, Brierley Hill Ironworks, near Dudley; and 118, Queen Victoria Street, London, E.C., from whom only it can be obtained.
CAUTION.—It having lately come to the knowledge of **HILL & SMITH** that spurious imitations of this Varnish are being offered by unprincipled dealers at a slight reduction in price, they would especially draw attention to the fact that every cask of their Varnish is legibly marked with their name and address, without which none is genuine.

JOSEPH BRAMHAM, HORTICULTURAL and HOT-WATER ENGINEER, WIRE WORKER, WEAVER, &c., 104, Dale Street, and 44, Elizabeth Street, Liverpool.
J. B. strongly recommends the **ALLERTON PRIORY BOILER** as one of the most powerful for extensive work. He has fixed one capable of heating 20,000 feet of 4-inch piping. See *Gardeners' Chronicle*, p. 67. Also a **WELDED WROUGHT IRON WATERWAY BACK** for ordinary Saddle Boilers. These Backs can be fixed to any Boiler now in use, and are a great saving in fuel and labour. He is also prepared to fix any kind of Boiler made.
Manufacturer of the Registered **LIVER FRONT** for large Boilers, **IRON and WIRE WORK** in all branches. References from Noblemen and Gentlemen for work done.
Plans and Estimates given.

THE CHEAPEST and MOST DURABLE SHADING.—"Lasting for years."
MADE OF PREPARED WOOL and HAIR.

Address, the Editor of the *Cultivator*, St. Michael's, Azores.

ADVERTISERS are requested to note that although we do not object to receive Letters to be called for, we cannot undertake to forward them.

PARTNERSHIP.—A Nurseryman, carrying on a successful business within 25 miles of London, is desirous of meeting with a Partner. Failing health causes Advertiser to wish to find a man, or man who in, say, one or two years would be able to take over from him the entire business. Money would be required, but every facility be afforded provided substantial guarantees were given. The fullest references given and required.—Address, by letter, giving outline of means and position, **NURSERYMAN**, Messrs. Norris, Allens & Carter, Solicitors, 20, Bedford Row, London, W.C.

First-class Opportunity.
PARTNERSHIP.—A Nurseryman in the South of England, carrying on a large Business as Nurseryman, Seedsman, Florist, and Landscape Gardener, and doing a large Cut-Flower Trade, is desirous of meeting with a practical Man or Men, with money, who, if arranged, could take over the whole after a year or two. The business is capable of being largely increased. The reason for requiring a Partner is illness in the family, which compels the present proprietor to live away from the business.—Apply, in first instance, to Messrs. **NUTTING and SONS**, 60, Barbican, London, E.C.

WANTED, a HEAD WORKING GARDENER. He must be thoroughly respectable, experienced in Vines, Greenhouses, and General Work, and have a pride in his job. State wages.—Apply, Moraston House, Ross, Herefordshire.

WANTED, a HEAD WORKING GARDENER and LAUNDRESS (Man and Wife): the Gardener must have a thorough knowledge of Vines and Greenhouse Plants. Wages, 30s. per week, with residence.—Apply, by letter, stating full particulars, to **Mr. H. E. PAINE**, Chertsey, Surrey.

WANTED, a SECOND GARDENER (Scottish preferred). Must thoroughly understand Cucumbers and the Working of Kitchen Garden—Apply to THE GARDENER, Drax Abbey, near Selby, Yorkshire.

WANTED, a Married Couple, without incumbrance, to take charge of a small House and Grounds in the Lake District of the North of England—the Man as GARDENER, and to make himself generally useful in and out of doors, the Woman as HOUSE-KEEPER and COOK when the House is occupied. None but of undoubted respectability and trustworthiness need apply. Testimonials preferred. Wages £50 per annum and coals.—Address X., John Williams, Esq., Broomfield, Swinton, Manchester.

Foreman and Grower.

WANTED, a thoroughly conscientious practical MAN. Must thoroughly understand the Management of General Nursery Work, Budding, Grafting, and the Propagation of all kinds of Nursery Stock. As the situation is permanent, one need apply whose character would not bear the strictest investigation—Apply, stating age, if married or single, and last situation, to E. WHITE, Bournemouth Nurseries, Bournemouth, Hants.

Nursery Foreman.

WANTED, an active steady MAN; must have good experience in Forest Trees, Conifers, Shrubs, Fruit Trees, &c.—Apply, stating age, salary expected, with references, to WM. SMITH AND SON, Aberdeen.

WANTED, an experienced Out-door NURSERY FOREMAN and SALESMAN. State age, references, and wages required.—R. THORNHILL, Bowdon Nurseries, Bowdon, Cheshire.

Propagator of Roses, Rhododendrons, &c.

PAUL AND SON want a clever, experienced Man, as Propagator (Indoors) of Roses, General Hardy Stuff, and Soft-wooded Plants. Efficient help and every encouragement given to a really painstaking Man.—Apply, by letter, to The Old Nurseries, Cheshunt, N.

WANTED, a young MAN, that has been used to Outdoor Nursery Work. None need apply who are not well up in the general routine of the same. Character for ability, honesty, and sobriety indispensable.—Apply, in the first instance, by letter only, to Mr. CHARLES YOUNG, The Nursery, Balham Hill, S.W.

WANTED, a Single MAN, for the Plant Houses, under the Foreman. To a suitable man 16s. per week, with furnished lodgings.—Mr. DEDMAN, Sundridge Park Gardens, Bromley, Kent.

WANTED, a Young MAN, under the Foreman, about 20, accustomed to Budding, Grafting, Roses, &c., and General Propagating, Forcing Grapes, Peaches, Cucumbers, &c., and choice Cut Flowers. State wages and references.—M., Merton Abbey Nursery, S.W.

WANTED, IMMEDIATELY, a Young MAN (not under 20), as Improver in the Houses.—J. R. METCALFE, The Gardens, Elsham House, Grantham.

WANTED, a steady, respectable Young MAN, quick at Potting and Tying, and can assist at Painting and Glazing. One from a market nursery preferred. Wages 18s. per week.—Apply with reference to JOHN TURTLE, The Nurseries, Welling, Kent.

Packer.

WANTED, an experienced PACKER of General Nursery Stock.—Apply, in own handwriting, stating wages, references, and where last employed, to CRANSTON AND CO., King's Acre Nurseries, Hereford.

WANTED, a CORRESPONDING CLERK and BOOK-KEEPER; must be well acquainted with the Nursery Business, and competent to take the Entire Correspondence, and occasionally to Travel. Unexceptionable references required.—Apply, stating salary required, &c., to CRANSTON AND CO., King's Acre Nurseries, Hereford.

MESSRS. RIVERS AND SON are requiring the services of a practical Man as CHIEF CLERK, who will be willing to make himself generally useful. Applicants should state full particulars as to references, salary required, &c.—The Nurseries, Sawbridgeworth, Herts.

WANTED, a thoroughly steady Man, to fill the office of SEXTON, and to do three days' work a week in the Churchyard. Further occupation might be found.—Apply to E. W. RUCK, Mayfield, Charn, Surrey.

WANT PLACES.

E. G. HENDERSON AND SON have many excellent GARDENERS with approved testimonials for ability now waiting in their Nurseries for re-engagement.

E. G. H. & Son will be pleased to answer any enquiries from Noblemen and Gentlemen requiring such.—Pine-apple Nursery, Maida Vale, London, W.

B. S. WILLIAMS, having at the present time several very excellent GARDENERS upon his Register, is desirous of placing them in Situations where great experience and trust are required. B. S. W. would at the same time beg to intimate that when a Gardener is applied for that the filling of the situation should be left with him, as that would prevent unnecessary correspondence and delay.—Victoria and Paradise Nurseries, Upper Holloway, London, N.

Head Gardeners.

JOHN LAING AND CO. can at present recommend with every confidence several energetic and practical Men, of tested ability and first-rate character. Ladies and Gentlemen in WANT of GARDENERS and BAILIFFS, or GARDENERS for First-rate Establishments or Single-hand Situations, can be suited, and have full particulars by applying at Stanstead Park and Rutland Park Nurseries, Forest Hill, London, S.E.

GARDENER (HEAD).—Married; has a practical knowledge of the profession in all its branches. Excellent character.—E. W., 32, Appleford Road, Upper Westbourne Park, N.W.

GARDENER (HEAD).—Age 36, married, two children; thorough practical experience in all branches of the profession. Four years' character. Please state particulars.—T. WOOD, Anstey Manor, Alton, Hants.

GARDENER (HEAD).—Age 33, married; thorough practical knowledge of the profession in all its branches. Good character. W. A., Inverness Villas, Manor Road, Staines Road, Hounslow, W.

GARDENER (HEAD), where one or more are kept.—Age 40, married, no family; thoroughly understands the profession (Indoor and Out). Left last situation owing to estate changing hands.—J. E., 17, York Rise, Kentish Town, N.W.

GARDENER (HEAD).—Age 32, married; has a thorough knowledge of Pines, Grapes, Peaches, Cucumbers, Melons, &c.—Is a good Plant Grower, Flower and Kitchen Gardener. Five years' good character.—W. P., 13, Union Place, St. Leonard's Road, Weymouth.

GARDENER (HEAD).—Single; twenty-five years' experience in the Forcing of Fruits of all kinds, Kitchen and Flower Gardening, and Gardening generally; could undertake the Laying-Out of Pleasure Grounds.—B. E., McLaren, Newsagent, Hammersmith, W.

GARDENER (HEAD).—Mr. WILSON, Gardener-in-Chief to His Grace the Duke of Norfolk, Castle Gardens, Arundel, can with great confidence recommend his Foreman to any Nobleman, Lady, or Gentleman. Highest references from several other first-class Noblemen's Establishments.—Please address as above.

GARDENER (HEAD), where two or more are kept.—Age 29, married; left through death and Gentlemen giving up the place; thoroughly understands the profession in all branches. Eighteen months' first-class character.—G. R., Post-office, Bishops Teignton, Teignmouth, Devon.

GARDENER (HEAD).—Married, one child, age 6; first-rate cultivator of all kinds of Fruit, Pines, Grapes, Peaches, ripe this year, April 21, Strawberries ripe March 20. Is also a thorough Plantman, including Orchids, Stove and Greenhouse, Hard and Soft-Wooded Ferns, &c.; also Vegetable Growing and Forcing in the highest perfection, the Erection and Heating of Glasshouses, and the Laying-out and Remodelling of Gardens, &c. First-class testimonials as to ability and probity.—WILLIAM ARMSTRONG, The Gardens, Denham Court, Uxbridge, Bucks.

GARDENER (HEAD, WORKING), where one or more are kept. Good references given.—G., 14, Bouvierie Road, Church Street, Stoke Newington, N.

GARDENER (HEAD, WORKING).—Age 36, married, three children; long experience Good character.—G., 39 Zennor Road, Balham, S.W.

GARDENER (HEAD, WORKING).—Age 39; practically acquainted with Gardening in all its branches. Twelve years and a half in present situation.—G. E., The Lodge, Miss Perceval, Manor House, Ealing, W.

GARDENER (HEAD, WORKING) where one or more are kept.—Age 25; well recommended as to ability. Good character.—Address, with particulars, G. T., Hampton House, Hampton Court.

GARDENER (HEAD, WORKING).—Age 26, single; practical experience in all branches of the profession. Seven years' good character.—X. Y., 10, West Street, Croydon.

GARDENER (HEAD, WORKING), where a practical, experienced, trustworthy person is required.—Age 20, married. Highly recommended, with good testimonials.—R. H., the Post-office, Chesham, Monmouthshire.

GARDENER (HEAD, WORKING), and FARM BAILIFF if required.—Thoroughly experienced in all branches. Wife can undertake a Small Dairy. Near London preferred.—W. P., Elm Cottage, South Norwood Hill, S.E.

GARDENER.—JOHN COWAN, The Vineyard, Garston, near Liverpool, would be glad to recommend to any Nobleman or Gentleman requiring a first-class Gardener a Man in the prime of life, who thoroughly understands the profession in all its branches, having had many years' experience in some of the best places in England and Scotland.

Gardener and Laundress.

GARDENER.—Young, married; fully conversant with the most modern and practical system of Horticulture in all its branches, Wife as Laundress. Unexceptionable references.—J. HOSKINS, Church Farm, Esher, Surrey.

GARDENER, or STEWARD and GARDENER.—ROBERT BURNS, for the last fourteen and a half years with J. L. Naper, Esq., of Loughcrew, Oldcastle, County Meath, and previously twelve years with Sir Charles Isham, Bart., Lamport Hall, Northampton, is open to treat with any Lady or Gentleman requiring a thorough practical Gardener; has had experience in Farm Work and Forestry, and could undertake the General Superintendence of a large Demesne.—The Gardens, Loughcrew, Oldcastle, County Meath.

GARDENER, good SINGLE-HANDED.—Middle-aged, no family. Wife to assist in the House if required.—J. S., Holeport Street, near Maidenhead.

GARDENER (SINGLE-HANDED), or where another is kept.—Age 37, married, two children. Six years' good reference from last situation.—J. J. BURDETT, Nursery, Maidenhead, Berks.

GARDENER (good SINGLE-HANDED, or SECOND).—Age 31, married, no family; understands the profession in all branches. Three years' reference.—A. B., 15, Clark's Cottages, Marsh Street, Walthamstow.

GARDENER (SECOND, or SINGLE-HANDED).—Age 25, single; understands Forcing Grapes, Cucumbers, Malons, Greenhouse, Flower and Kitchen Gardening. Good character.—T. S., Sutton, Guilford.

GARDENER (SECOND, or SINGLE-HANDED).—Age 21; seven years' experience, both Inside and Outside Work. Good character.—J. RICKARDS, Crumlin Hall, Newport, Monmouthshire.

GARDENER (SECOND), in a Gentleman's Garden, where four or five are kept.—Age 21. Bothy preferred.—Good character.—Please state terms to J. MOSS, Titley, Herefordshire.

GARDENER (SECOND, or otherwise).—Age 23, single; six years' experience in all branches of Gardening. Good character.—W. CAVE, 46, Dacre Street, Lee, Kent.

GARDENER (SECOND), or under a Foreman, in a Gentleman's Establishment (small).—Age 22; respectable. Twelve months' good character from present situation. Leaving through breaking up of establishment.—Address, stating wages, to W. B., Rolls Park, Chigwell, Essex.

GARDENER (UNDER, or SINGLE-HANDED).—Aged 25.—P. W., Sunninghill, Berks.

GARDENER (UNDER).—Age 20; five years' experience. First-class references.—ALFRED COOPER, 5, Belmont Street, Chalk Farm, London, N.W.

FOREMAN, in a good Establishment.—Age 24; thoroughly practical, good appearance.—J. A. B., The Gardens, Lambton Castle, Fence Houses, Durham.

FOREMAN, in a Gentleman's Garden.—Can take the Management of the Houses.—Please address, stating particulars, F. P., 6, Camden Place, Bourne End, Maidenhead, Berks.

FOREMAN, or SECOND, in a Nobleman's or Gentleman's Garden. Well up in all branches of the profession. Three years' good character from present employer.—G. L., Post-office, Brighton Road, Croydon.

FOREMAN (GENERAL), in a Gentleman's Garden.—Age 27, single; twelve years' experience in Plant and Fruit Growing under Glass, Flower and Kitchen Gardening. Good reference.—G. W. J., Rose Cottage, Fairfield, Leatherhead, Surrey.

JOURNEYMAN, in a good Establishment.—Age 21; fair knowledge of Pines, Vines, Peaches, &c. Two years' good character from last situation.—W. H., 18, Stunford Road, Fulham, S.W.

PROPAGATOR (HARD-WOODED, INDOOR).—Understands the Propagating of Conifers, Clematis, Rhododendrons, Camellias, &c.—F. R., Meadow Nursery, Godalming, Surrey.

To Nurserymen.

PROPAGATOR (SOFT-WOODED).—Age 28; long experience in Growing Soft-wooded and General Bedding Plants. Last situation nine years.—S., 19, Merton Road, Kensington, W.

IMPROVER.—Wanted to place a Youth, about 16, with a practical Gardener, with a view to Learning Grape Growing, &c.—Box 300, Advertiser Office, Leicester.

To Gentlemen's Gardeners.

SEED TRADE.—HEAD COUNTERMAN, Age 23; over seven years' experience in good houses Good references.—ALPHA, Keith & Co., Edinburgh.

KINAHAN'S LL WHISKY.

Universally recommended by the Medical Profession. A pure old spirit, mild, mellow, delicious, and most wholesome. Dr. Hassall says, "The samples were soft and mellow to the taste, aromatic and ethereal to the smell. The Whisky must be pronounced to be pure, well-matured, and of very excellent quality."—Wholesale: 20, Great Titchfield Street, London, W.

DINNEFORD'S FLUID MAGNESIA.

The best remedy for ACIDITY of the STOMACH, HEARTBURN, HEADACHE, GOUT, and INDIGESTION, and the safest aperient for delicate Constitutions, Ladies, Children, and Infants.—DINNEFORD AND CO. 172, New Bond Street, London, and all Chemists.

HOLLOWAY'S OINTMENT and PILLS

If these Medicines be used according to the directions which are wrapped round each pot and box, there is no Wound, Bad Leg, or Ulcerous Sore, however obstinate, but will yield to their Curative Properties. Numbers of persons who had been patients in the large hospitals, and under the care of eminent surgeons, without deriving the least benefit, have been cured by Holloway's Ointment and Pills, when other remedies had signally failed. For Glandular Swellings, Tumours, Scurvy, and Diseases of the Skin there is no Medicine that can be used with so good an effect. Though potent for good, it is powerless for harm, and though the Cure it effects is rapid it is also permanent.

Send for a PRICE LIST of

BLAKE'S SELF-ACTING HYDRAULIC RAMS,

For Raising Water for the Supply of
Villages, Irrigation, Railway Stations, Mansions,
Fountains, Farms.

No Cost for Motive Power, which is obtained from the
Stream of Water passing through the Rams.

NO OILING OR PACKING REQUIRED.

Made in sizes to raise from 300 to 100,000 Gallons per day.

WILL FORCE TO A HEIGHT OF 1,500 FEET.

This Ram will raise a part of the same water that works it, or will raise pure water from a well whilst it is worked by a stream of impure water.

TESTIMONIALS.

From the Right Hon. T. SOTHERN ESTCOURT, *Estcourt Park, Gloucestershire, September 6, 1875.*

"You will be glad to hear, as I am to tell you, that your Self-acting Hydraulic Ram has worked exceedingly well and continuously since it was erected, more than twelve months ago. It is, in fact, perfectly successful."

(The delivery pipe in the above case is 4200 feet long, with 100 feet rise.)

From Captain TOWNSEND, *Wineham, February 10, 1877.*

"In answer to your inquiry, I am glad to say the Hydraulic Ram you sent me in November, 1875, is working exceedingly well, and gives no trouble. It will work when quite immersed, as it has been several times during the floods this winter, forcing up water through a delivery pipe 900 yards long at the rate of 80,000 gallons per day, although you only promised 50,000."

From JOHN BARNES, Esq., *Contractor, Chatburn and Hellfield Railway, Contractor's Office, March, 1877.*

"Dear Sir,—I have the pleasure to inform you that the three Hydraulic Rams you erected for me on this contract about two years ago, have continued to work very satisfactorily, without requiring any repairing. With a fall of 5 feet sufficient water has been raised daily by each Ram to supply two of my locomotive engines: they have fully answered my expectations and all that has been said of them."

Deanwater, Wiltshire, November 20, 1873.

"Dear Sir,—In answer to your inquiries respecting the Hydraulic Ram you supplied me with six months ago, I beg to state that I am more than satisfied with it, as it is in perfect order, sending up to the top of the house about 2000 gallons of water in the twenty-four hours, whereas you only contracted to deliver in that time 500 gallons. I have, therefore, every reason to be well pleased with your work, and more especially as I had a Ram supplied me by another maker which could not send up a single gallon of water to the height required, and a second maker informed me that no Ram with a fall of 3 feet could send up water to the distance required, namely, 120 feet. But yours is an accomplished fact, and does its work most effectually.—I am, yours truly, L. HANMER."

From Mr. THOMAS MASON, *Alkinoates Hall, Colne, September 30, 1871.*

"Sir,—Your self-acting Hydraulic Ram gives me entire satisfaction; it has been at work about fifteen months, and has only been seen once during the last six months; it is forcing about 1400 gallons per day of twenty-four hours to a height of 194 feet."

From JOHN PENNINGTON, Esq., *Emmott Hall, near Colne, December 21, 1863.*

"Sir,—The Self-acting Hydraulic Ram you supplied me with nine months ago continues in excellent condition. It receives water from a spring through a 2-inch pipe, of which it forces 3600 gallons per day of twenty-four hours to a height of 90 feet, exceeding all you promised, and far surpassing the water-wheel and force pumps which it has displaced. Its cost is small, it occupies but little space (2 square feet), and in mechanical detail is simplicity itself. I have much pleasure in recommending it as a cheap and efficient method of raising water."

JOHN BLAKE,
ENGINEER, ACCRINGTON.

IMPORTANT SALE OF PLANTS, consisting of Azaleas, Camellias, Heaths, Palms, Tree Ferns, and a large collection of Dracaenas, Crotons, Amaryllis, and other Plants suitable for stove, greenhouse and conservatory decoration.

MESSRS. P. BURN, SON and CO., AUCTIONEERS, Glasgow, beg to intimate that they are instructed by Messrs. Thorne, Great Western Nurseries, to SELL by AUCTION, the above, for which they have no accommodation, within the City Hall, Glasgow, on WEDNESDAY and THURSDAY, September 19 and 20.

Full particulars in future advertisements and Catalogues, which will be ready shortly, and may be had on application to Messrs. J. AND R. THYNE, Buchanan Street, or at the Auctioneers' Office, 108, West Nile Street, Glasgow.

N.B. In the above Collection will be offered many Choice Plants, which have been awarded first prizes at the leading exhibitions throughout the country.

TO BE SOLD, a small Suburban FLORIST'S BUSINESS, on advantageous terms (4297).—The Nursery is 2 acres in extent, or thereabouts, adjoins an important station on the North London Line, twenty minutes' ride from the City, and 3 miles from Covent Garden. It occupies a commanding position, with a long line of frontage to the high road. Rich soil, in good cultivation. Good Jobbing Trade. Lease (direct from Lord Mansfield) eighteen years unexpired. Rent, £40 per annum. Income moderate. Stock and Glass by valuation, or a reasonable offer would be entertained. Apply to PROTHEROE AND MORRIS, 98, Gracechurch Street, E.C.

London, West End.—To Florists and Others. (4299)

In the Centre of a First-Class Neighbourhood.

TO BE DISPOSED OF, the BUSINESS of a FLORIST and SEEDSMAN. Premises comprise Dwelling-house with side cart entrance, large Cellarage and Offices, 6 Bedrooms, 3 Reception-rooms (which are at present partially let off and thus pay the rent), also a commanding Shop, 18 feet by 15 feet, with handsome Plate-glass Front. Lease nineteen years unexpired. Rent £90 per annum. Close by is a small Nursery, held at £10 per annum, with 3 Greenhouses and Sundry Frames thereon. Shop Fittings, Glass and Stock in Trade, by valuation, or a lump sum would be accepted for the whole.

Apply to PROTHEROE AND MORRIS, Horticultural Agents, 98, Gracechurch Street, E.C.

Ember Nursery, Thames Ditton.

By order of the Executors of the late Mr. J. Lewis.

TO BE DISPOSED OF, on easy terms, the thoroughly genuine BUSINESS connected with this old established Nursery. The Nursery comprises Dwelling House, about 9 acres of first-class Land, fully stocked, and about 17,500 feet super of modern Glass. Lease 16 years unexpired. Rent £75 per annum. Greenhouses belonging to tenant and also the indoor stock and utensils in trade to be taken by valuation.

N.B. To facilitate the disposal of the Business, it is proposed to effect an AUCTION SALE of the whole of the valuable OUTDOOR STOCK, thus giving the Purchaser the opportunity of buying at a cheap rate what stock he might require to carry on the business.

Particulars to be obtained only of PROTHEROE AND MORRIS, Horticultural Agents, 98, Gracechurch Street, E.C.

To Nurserymen and Others.

TO BE DISPOSED OF, one of the oldest established NURSERY BUSINESSES in the North of England, with valuable connection.

The executors of the late Mr. John Harrison, of the North of England Nurseries, Catterick Bridge and Scorton, are open to treat with a gentleman possessing capital, for the disposal of the business, which has an established connection of nearly 50 years.

The Nurseries consist of about 60 acres of Freehold Land, about 40 acres of which are stocked with a choice Collection of Roses and General Nursery Stock. There are good Residences in the Grounds, and fine Ranges of Glass, close to the Catterick Bridge Station of the North-Eastern Railway, situate between Darlington and Richmond, and offering unusual facilities for doing a large and profitable business. A large portion of the purchase money could remain on security of the property at a reasonable rate of interest. Possession could be given at any time as a going concern. Principals, or their Solicitors only may apply to the undersigned.

A. E. HARRISON, Solicitor, Church Yard, Rotherham.

To Market Gardeners and Others:

DESIRABLE OCCUPATION. TO BE LET, with Immediate Possession, if required, a SIX-ROOMED COTTAGE, with FIVE ACRES of excellent GARDEN GROUND, well stocked with the choicest Fruit Trees, Three Houses with Plants and Vines, and the necessary Out-buildings. The Property is situate at Bracebridge, within two miles of Lincoln, where there is an excellent market for all kinds of garden produce. Rent, £35. Apply to C. WHITE, Brayford Head, Lincoln.

MESSRS. PROTHEROE AND MORRIS invite Owners of Marketable Properties who are desirous of effecting ADVANTAGEOUS SALES to forward them Plans and Particulars, which will be duly placed before such Purchasers as are likely to buy. They have at the present time a number of wealthy Capitalists on their books who are desirous of Investing in Land, and the mode of procedure they adopt avoids all publicity and expense. No charge is made unless they succeed in introducing a purchaser. The Receivership and Management of Estates undertaken upon moderate terms. See p. 304 for Properties recently Sold.

THE IMPROVEMENT OF LANDED ESTATES, BY DRAINAGE, ENCLOSING, CLEARING, THE ERECTION OF FARM BUILDINGS and COTTAGES, WATER SUPPLY, &c.

The Land, Loan and Enfranchisement Co. (Incorporated by Special Act of Parliament) ADVANCES MONEY.

1st.—To the OWNERS of SETTLED and OTHER ESTATES, for the Erection of Farm Buildings and Cottages, and for the Drainage, Irrigation, Enclosing, Clearing and General Improvement of Landed Property in any part of the United Kingdom.

2d.—To the OWNERS of SETTLED ESTATES in ENGLAND, for the Erection or Completion of Mansions, Stables, and Outbuildings, and for the Construction or Erection of Reservoirs, and other Works of a permanent nature, to supply Water for the use of the Estate, or for any other purpose.

3d.—To LANDOWNERS generally, to enable them to subscribe for Shares in Companies for the Construction of Railways and Navigable Canals, which will beneficially affect their Estates.

4th.—To INCUMBERTS, for the Improvement of their Glebe Lands, by Drainage, and the Erection of Farm Buildings and Cottages.

5th.—To COPYHOLDERS, for the Enfranchisement of Copyhold Lands. The amount borrowed, with the expenses, would be charged on the Estate benefited, and repaid by a rent-charge, terminating in twenty-five years.

No Investigation of the Landowner's Title is necessary. Forms of application, and all further particulars may be obtained of Messrs. RAWLENCE and SQUIRE, 22, Great George Street, Westminster, S.W., and Salisbury; of Messrs. ASHURST, MORRIS, CRISP, and CO., 6, Old Jewry, London, E.C.; of Messrs. GILLESPIE and PATERSON, W.S., 81A, George Street, Edinburgh, Agents for the Company in Scotland; and at the Offices of the Company, as below.

T. PAIN, Managing Director. EDWIN GARROD, Secretary. Land, Loan, and Enfranchisement Company, 22, Great George Street, Westminster, S.W.

Case, Packing, and Carriage Free to any Railway Station in England and Wales.

Other Collections, 12s 6d., 42s., 63s., and 84s. each.

From Mr. H. BENNETT, Belle Vue Crescent, Clifton, Bristol, March 10, 1877.

"I am glad to tell you that the Hyacinths, Tulips, and Crocus I had in the Autumn have given entire satisfaction: the flowers are splendid."

From R. PRONVOE, Esq., Bathgate, N.F., February 7, 1877.

"The Bulbs received from you in the Autumn have been particularly fine; some of the Hyacinths and Tulips now in bloom are large and beautiful, and have far exceeded any that I have had before."

DANIELS BROS.,
 THE QUEEN'S SEEDSMEN, NORWICH.

CHARLES VUYLSTEKE, NURSERYMAN, Loochristy, near Ghent, Belgium.

AMIES' CHEMICAL MANURE.

*Used by the Royal Horticultural and
Botanic Societies.*

This Manure, after six years' trial, is unapproached in its
results by any other manure. It is suitable for all soils, and
permanently improves the fertility of even the poorest. It pro-
vides the necessary foods for plants, creates a vigorous growth
without over-stimulating, and it increases the produce. It is
a powerful insecticide. It has been used with perfect success on

FLOWERS, SHRUBS, VEGETABLES,
FRUITS, GRASS, VINES.

PREPARED IN A FINE, DRY, INODOROUS POWDER.

Price, £12 per Ton; 15s. per Cwt.; and in
Canisters, 1s., 2s. and 4s. each.

*Trial Orders of the Manure are invited, to be used
in comparison with other Manures.*

NEW LATE KEEPING BLACK GRAPE, "ALNWICK SEEDLING."

This Grape was exhibited before the Fruit Committee, South Kensington, February 6, 1876, under the name of CLIVE HOUSE SEEDLING, a name the Committee have since thought fit to alter. The following is the description given by the Fruit Committee:—"It is a seedling between the Black Morocco and an unnamed variety raised at Wortley. The bunch shown was of fair size and well shouldered, and the berries large, oval in form, and jet black in colour, with a thick skin. The flavour was decidedly good, partaking of the rich sparkling flavour of the Black Morocco, but much sweeter. It has kept well till February, and will, no doubt, keep longer and prove a better Grape for general cultivation than the Black Alicante."

This has been awarded a First-class Certificate.

B. S. W. has much pleasure in offering this fine new Grape, believing it to be a decided acquisition. The stock offered is from the original plant. Early orders are respectfully solicited, as the stock is limited.

Price 21s. and 42s. each.

NEW FIG—"HARDY PROLIFIC."

The fruit of this hardy Fig is about the medium size, Pear-shaped, rather tapering towards the stalk. The flesh is very sweet and luscious. It was introduced from France some few years ago, and has proved itself perfectly hardy. It must become a general favourite, as it is a very abundant bearer, either in pots or in a cold house, as well as on an open wall. It also ripens earlier than any other variety we know of.

Price 10s. 6d. each. Extra sized Fruiting Plants, 21s. each.

B. S. WILLIAMS,

VICTORIA AND PARADISE NURSERIES,
UPPER HOLLOWAY, LONDON, N.

HUGH LOW & Co.

HAVE PLEASURE IN INFORMING THEIR FRIENDS AND THE PUBLIC THAT THEIR

STOCK OF WINTER AND SPRING FLOWERING PLANTS

Is this season unusually extensive in quantity and fine in quality, and well worth the notice of intending purchasers, who are very cordially invited to an inspection of the Plants, which comprise amongst other things:—

For WINTER FLOWERING.

The annual stock of the above being unusually fine this year, early Orders are solicited, and may be executed henceforth at the undermentioned low prices, viz. :—

AZALEA INDICA (my own selection), good plants £5 per 100; stronger, and very fine, £6, £8, £10, £12, to £20 and upwards per 100.

None but first-rate varieties, all to name.

CAMELLIAS with Buds, best named sorts, with a fair proportion of Old Double White (selection as above), good plants, 1 to 1½ foot high, £7 per 100; stronger and very fine, £10 to £20 per 100; larger plants, 8s. to 30s. each, and upwards.

CAMELLIA ALBA PLENA, without Buds, an immense stock of very fine strong plants, at £12, £16, and £20 per 100 and upwards.

SPIRÆA (HOTEIA) JAPONICA, Clumps for Forcing, £10 per 1000.

ORDERS TO BE DIRECTED TO

JEAN N. VERSCHAFFELT,
134, FAUBOURG DE BRUXELLES, GHENT, BELGIUM.

HOTHOUSES Built with WOOD,
Seasoned and Preserved by Gardner's
Patent Process,
Are rendered practically Imperishable, being
Proof against Damp or Dry-Rot.

We beg to intimate that we have obtained a License from Mr. GARDNER to use his PATENT PROCESS, and that the necessary Apparatus has been erected at our Works here, so that we can now supply **real Imperishable Hothouses** at an advance of from three to five per cent. on our ordinary prices, according to the amount of Timber used.

JAMES BOYD & SONS,
HORTICULTURAL BUILDERS,
In Wood or Iron, and Manufacturers of
Hot-water Apparatus
FOR HEATING HOTHOUSES,
Churches, Mansions, Public Buildings,
Harness Rooms, &c.
PAISLEY.

ESTABLISHED FORTY YEARS.

Our Works (which are now the most extensive in the Trade) being situated within a few miles of Glasgow, we are enabled to forward Materials at the Lowest Rates, by Rail or Water.

Having extensive Sawing and Moulding Mills, employing skilled workmen in all branches of the trade, and giving our whole attention to the business, we can execute any orders entrusted to us at *unusually low prices.*

HOTHOUSES ERECTED BY US
MAY BE SEEN AT—

- Mentmore, Buckinghamshire.
- Hatfield and Nyn Park, Hertfordshire.
- Ragley, Alcester, Warwickshire.
- Haydon Hall, Pinner, Middlesex.
- Ashfield, Edgbaston, Birmingham.
- Oaklands, Harborne, Birmingham.
- Cardiff Castle, South Wales.
- Gogerddan, Aberystwith, Wales.
- Thornton-le-Street, Thirsk, Yorkshire.
- Crofton Hall, Wakefield.
- Sandgate, Puborough, Sussex.
- Pickhurst, Whiteley, Surrey.
- Ashburne, Sunderland.
- Browtop, Keswick, Cumberland.
- Derwent Lodge, Cockermouth.
- Newbottle, Dalkeith.
- Oxenford Castle, Dalkeith.
- Castle Kennedy, Stranraer.
- Stapleton Tower, Annan.
- Glasserton and Tonderghie, Whitthorn.
- Belle Isle, Ayr.
- Auchmore, Perthshire.
- Inverary Castle, Argyleshire.
- Mayfield, Dundee.
- Ardgowan, Renfrewshire.
- Rawcliffe Lodge, Glasgow.
- "Kibble Crystal Palace," Glasgow.
- Elie, Fifeshire.
- Duart Castle, Mull.
- Powerscourt and Glanmore Castle, Co. Wicklow.
- Phoenix Park, Dublin.
- Carton, Maynooth, Dublin.
- Lismany, Cregglare, and Garbally, Co. Galway.
- Summerville, Limerick.
- Cahercon, Co. Clare.
- Ashford, Cong, Co. Mayo.
- Tollymore, Gilford, Seaford, &c., Co. Down.
- Rathmore and Orangefield, Belfast.
- Parkanaur, Dungannon.

And in most parts of Great Britain and Ireland; also in Australia, New Zealand, Cape of Good Hope, &c.

From the COURT CIRCULAR, September 1, 1877.—"Sutton's Autumn Catalogue of Flowering Bulbs is one of the neatest and prettiest books of the kind yet published, and contains a vast amount of valuable information on the cultivation of bulbous flower roots, which is sufficient to commend it to the notice of all who are fond of floral beauties. Messrs. Sutton & Sons, the Queen's Seedsmen, have long enjoyed the enviable reputation of standing in the foremost rank of floriculturists, and the painstaking care evidenced in the production of this year's catalogue deserves the warmest commendation."

FRUIT.

THE English are often said to be the beef-eating nation—more disposed to animal than fruit diet. This in a great measure is no doubt correct, and there are a combination of circumstances to which collectively it is attributable. Climate in all cases has a potent influence in rendering particular descriptions of food not only more palatable in one part of the world than another, but also more necessary to support and nourish the human frame. A native of the frozen regions will swallow with avidity an enormous amount of fat, the sight and idea of which would disgust an inhabitant of the tropics. Our changeable climate, with its moisture-charged, chilling winds through a great portion of the year, quickly extracts the warmth from our bodies, and requires suitable food to keep up animal heat. This the long prosperous condition of the country, consequent upon the industrious hard-working disposition of the people, enables them to procure, and when those of other nations taunt us with our beef-eating propensities we may retort by the old rejoinder that "those who lose may laugh, for those who win are sure to," and it is generally noticed that, when foreigners come to reside amongst us, somehow or other they usually experience remarkably little difficulty in getting used to "the roast beef of Old England." Again, our climate (we are always finding fault with it, although by no means deserving of all the blame laid to its charge) is not the best adapted for the growth of many kinds of edible fruits, the greater portion of which, although their origin rests in obscurity, have evidently sprung from species indigenous to countries where the mean temperature is higher than in ours, or the summers longer, with an absence of the spring frosts so disastrous to most of the fruits we grow. Yet, nevertheless, with these difficulties, fruit culture, if even to a limited extent, has long been pursued in this country, as evidenced by the Vine alone, of which there are proofs innumerable of its being grown at a remote period. The records of the old monasteries show that the monks, when located in any part of the kingdom where the climate and soil was such that it could be induced to bear fruit, never failed to take it in hand. From their habits of patient industry and observation, there can be little doubt that they would accomplish all that was possible with it in the conditions under which they laboured, but what their success really amounted to, measured by our ideas of Grape growing at the present day, is likely to remain a conjecture. Their principal object no doubt was to grow Grapes for the wine-press, and there are few who have any knowledge in these matters who are not aware that wine of fair quality can be made from Grapes that would not be very agreeable to eat.

Some twenty-five years ago there was a good deal of stir made about growing Grapes on what were called Hoar's Vine pillars, but the system, as was predicted by most of those who studied the subject, never came to much; and such I fear will be the result of the attempt now being made to grow Grapes in an open-air vineyard, by the Marquis of Bute, at Castle Coch, near Cardiff. Although far from being disposed to throw cold water on the project, I should be

much pleased if my mistake was proved by the success of the undertaking. In this, as in the cultivation of many other things, there is a wide difference betwixt what it is possible to accomplish where no account is taken of the cost, and that which accrues from a reasonable expenditure in labour and appliances. In the production of Apples and Pears it is doubtful if there has been very much increase in recent times, at least for market supply; at all events if there has it bears no comparison with the increased consumption, as evidenced by the immense importations of these fruits; neither is there likely to be under the uncertainty of seasons, of which we continuously have unwelcome evidence—at any rate, market growers are the most likely people to know if further extension in this branch would have a fair chance of being remunerative, although, if the ideas entertained by some who write on this subject were correct, and the advice they give deserving of being acted upon, it would follow that the market growers were the most ignorant set of individuals as to their own interests in existence. It must ever be borne in mind that the land which will grow these fruits must be good in quality, and not of the miserable character sometimes spoken of as suitable, and all who treat upon this subject should never lose sight of the fact that in this country land and labour—the two most important elements involved—are both dear, and that the countries that send us these fruits are immeasurably less under the influence of seasons that result in failure, and land and labour with them conjointly does not cost more than one-half what it does with us. To set against this the foreign cultivator only labours under the disadvantage of extra cost in carriage. In numbers of private gardens, especially of the smaller class, no doubt much might be done by a better system of cultivation, and in all the one great desideratum is a discarding of the many varieties which do not bear freely, and the substitution of the comparatively few which may generally be relied on. The fatal and unaccountable mistake—a mistake that is all but general amongst private growers in the cultivation of Apples and Pears in this country—is the planting of uncertain bearing kinds.

In the cultivation of small fruits there has evidently been a great increase in recent years, particularly for the supply of large towns, where these, as well as Apples, Pears, and Plums, are consumed by the working portion of the community to a much greater extent than they once were. This cannot fail to be an advantage in every way, as a reasonable quantity of wholesome fruit is no doubt more conducive to health than otherwise, and its cultivation affords employment to large numbers of people in the districts where it is grown, in addition to the land making a far greater return than what it would do under agricultural crops. There can be no doubt the consumption in the principal towns, especially London, would be double what it now is, were it not for one serious obstacle—namely, the unreasonable disproportion that exists between the price the grower realises, and that which the consumer has to pay—a difference frequently of from 100 to 200 per cent., and sometimes more, as in the present summer, when during the height of the Strawberry season the best fruit in the London markets was not making to the growers more than from 4s. 6d. to 6s. per dozen punnets, and the same fruit was charged in the shops from 1s. 3d. to 1s. 6d. each punnet.

This is only a simple instance of what is continually going on. The mass of the people in London never get fruit at a reasonable price until there is a glut, and it reaches the costermongers' carts and barrows, and then the grower scarcely receives enough to pay the cost

of picking and marketing, leaving him minus anything for rent and taxes; and the disparity, only to a somewhat less extent, exists in English-grown fruits of a character that will keep several weeks. *T. Baines.*

NOTES FROM A LANCASHIRE GARDEN.

SEPT. 1.—This summer is certainly, so far as I am concerned, "the winter of my discontent." Everything since last I wrote these notes (in February) has been going wrong. My first grievance I share with all the world—was such a cruel spring ever known before? Pears, Plums, and Peaches, were all a mass of blossom, and nothing could look more promising. Then came frost after frost, cold winds pierced through every screen of defence, and down fell unset bloom or half-set fruit. Only eight Peaches remain on all my trees, and not one single Nectarine; the Apricots grew to the size of Walnuts and then tumbled one by one, and the Plums never grew at all. Cherries were the merest handful; Pears seemed to have set, but the young fruit turned yellow, and many trees are entirely bare; even of Apples our crop is but a short one.

But this was not the worst, and I am going to tell my further troubles as a lesson and a warning to others. I have never been very fortunate in my gardeners. My first gardener was so sulky that I had to part with him; my next gardener was good in his way, but he often drank and neglected his work; then I had a man who was so lazy that he scarcely did any work at all. At last three years ago, I got (apparently) an excellent gardener. He worked with a will, and he was an intelligent, sober, and rather well-read man. For some time nothing could be more satisfactory, but the second year there seemed a falling off, the houses were not so well kept, everything appeared to be a failure. If I found fault there was always some capital excuse, and I tried to be satisfied and hope for better times. Meanwhile, my bills became increasingly heavy, and, besides what the stable supplied, we were for ever buying manure. Still, whenever I made a particular point of anything it was done, and sometimes well done, and though I was feeling more and more discontented there was nothing tangible for me to seize hold upon. But this last spring my uneasy feelings grew more uneasy still. On the other hand the excuses were stronger than ever: such a bad spring had never been known; the under gardener had been ill, and work had been thrown back; there was more lawn to mow; the old-fashioned flies in the vineries had been out of order; thrushes had been more destructive than ever, and yet I did not like them shot; the children would keep pigeons, and the pigeons devoured everything. However, I did not see that all these excuses together accounted for many things that were going wrong. The Rose trees were covered with greenfly, and the Orange trees with scale. Our forced Strawberries were good, but forced French Beans and Tomatos were complete failures. Many favourite old herbaceous plants seemed to have disappeared, and my new cuttings were neglected. We had scarcely any Cucumbers, and Vegetable Marrows had not been planted. The Peach trees, nipped by the frost, were half destroyed with aphid. The spring bedding was only partially successful, and the summer bedding was kept back too late. It was clear this could go on no longer. I spoke sharply to the man; he was insolent, and I told him he must go. Just then most fortunately the half-yearly bills came in, and I analysed them with an attention which I had never given to the garden bills before. I found that I was patronising three different nurserymen, and each had been good enough to supply me with a very select assortment of seeds and plants. For years past I had had some fine *Lilium auratum*, which I took in each winter and planted out in summer; but this year they appeared all to have died without giving any notice (!), and one nurseryman had replaced twelve at 2s. 6d. each, and another three for 15s. Hepaticas and double Primroses had not been very successful with me, and my gardener had been buying new plants in pots, and then allowed them to perish from neglect. Nineteen quarts of garden Peas had been requisite during the six months, and a row of Sweet Peas had taken a gallon of seed. One nurseryman had within the half-year supplied four pruning knives, and within two months three pair of pruning gloves. Many plants, which I cannot find at all, appear in these

bills, and the variety of seeds which have never come up is quite astonishing.

Of course the nurserymen all say they supposed my gardener was getting all these things (pruning gloves and all) with my knowledge and consent, and deny that they are in any way to blame. I can only consider them a singularly unsuspecting class of people, and in one case at least I am very far from being satisfied. However, it will be my own fault if I have any further cause of complaint, for I shall not allow a single packet of seed to be purchased without a written order from myself.

But now let me turn away from these troubles to the pleasures, of which even the worst season and the worst gardener could not deprive me. As I have already said, the spring garden was a failure, but we had nevertheless three beautiful beds. One was of Anemones, the delightful old flowers—"pied wind-flowers" Shelley calls them—which first sprang to birth when Venus wept Adonis. The two other successful beds were of *Ranunculus*, one of the finest scarlets, so deep and intense that they seemed to be almost black in the inner shadows of the petals. And this reminds me of what a gifted American lady once said to me—"Does not black seem to underlie all bright scarlet?" I thought of this when I saw this bed of *Ranunculus*, and I think of it often when I see the red coats of our soldiers passing by. I have often noticed, too, that in an evening, when there is still light enough to see flowers that are yellow or blue or pink, the blossoms of a scarlet *Pelargonium* give forth no colour, but look as if cut out of some soft black velvet. The other bed of *Ranunculus* was of various sorts, most prettily and fancifully mottled. One bed, from which I had hoped much, was a disappointment, for hardly one half of the Crown Imperials of which it was composed flowered at all. Why this was I cannot tell, for the bulbs were fine enough, and the flowers of some of them were magnificent. I had never examined a Crown Imperial properly till this spring, and never knew that its great beauty lay in the little circle of pearls—nectaries, I suppose they are—which lie at the bottom of each orange bell. They are quite exquisite in their grey and white glittering movement as the light plays upon them, and are more like pearls than anything else in Nature.

But if the spring garden was not what it should have been, the flowering shrubs on the lawn were simply wonderful. Everything seemed to blossom, and every blossom seemed finer than I had ever known it. All the more ordinary shrubs were in fullest splendour, and I had several which were comparatively new to me. Among them were the large-flowered *Philadelphus*, and the lovely little *Diplopappus*, while the very *Hollies* became (as I never saw them before) ornamental flowering shrubs. The one exception was the *Rose des Alpes*, though the *Kalmias* in the same bed did capitally.

But I must now speak of our summer flowers. Roses have never blossomed so abundantly with me, in spite of the greenfly. A bed of *Sweet Williams* was effective in its way, but the strain was not a good one. Some of my favourite beds, which I have mentioned in previous years, have done well this year also. Here is the blue *Agapanthus* with the *Lobelia cardinalis*. Here are the *Lilium auratum*'s for which I paid so dearly, with *Heliotrope* between. Here are the hybrid *Begonias* set in a mass of *Sedums*. Here is the long row of *Sweet Peas*; here are the *Canna indicas* and *Yuccas*, with the *Thamnocalamus Falconeri* (*Arundinaria falcata*), which has unluckily taken to flowering, and will, I suppose, die away. Other successful beds are the *Bijou Pelargonium* surrounded by a belt of *Viola cornuta* and a bed of *Zinnias*, through which pierce the scarlet swords of the *Gladiolus*. A row of *Cuphea* in a ribbon border is new, but not particularly striking, and the *Carnation* bed is spoilt by the number of single flowers which it contains.

But really I sometimes wonder that any beds are good. The spring was ungenial, but what has the summer been? It poured on St. Swithin's Day, and, ever since, the weather has done its very best to keep up the reputation of the Saint.

One of the many evils of a wet summer is the difficulty of keeping the lawn in order. The mowing-machine is of comparatively little use, and yet we can hardly fall back upon the scythe—I sometimes wish we could. Who does not remember Andrew Marvell's delightful poems about mowers—and he wrote at least five of them. There is "Damon the Mower," "The Mower to the Glow-worm," "The Mower's Song," "The Mower Against Gardens," and

"Ametas and Thestylis Making Hay-ropes;" and again, in his fine poem on "Appleton House," he describes the "tawny mowers" dividing the "grassy deeps"—

"With whistling scythe and elbow strong."

One of our latest poets, Mr. Allingham, too, has a delicious little mower's song with a quite perfect refrain of—

"A scythe-sweep and a scythe-sweep,
We mow the grass together."

And surely no sound has such poetry in it as the strong sharp sweep of the scythe when it whistles through the falling grass, or the shrill murmur of the blade upon the whetstone.

as these, and yet there are some, scarcely less good, by Browning about a thrush; and, after all, it is the thrush and not the swallow to whom we owe the best voice that spring can give us. The nightingale may be stronger and sweeter of note, but the nightingale only sings in certain districts, and the thrush seems to be everywhere. The nightingale sings later in the night, but the thrush will go on till nine and begin again at four, and surely that is all we need. But now for Browning's lines—

"Hark! where my blossomed Pear tree in the hedge
Leans to the field, and scatters on the clover
Blossoms and dewdrops—at the bent spray's edge—
That's the wise thrush—he sings each song twice over,
Lest you should think he never recapture
The first fine careless rapture!"

"The large Peach," says Mr. Rivers, "which I have named Prince of Wales, was raised from a stone of a Pitmaston Orange Nectarine. Out of ten seedlings of the second generation—*i.e.*, stones of the Prince of Wales Peach—five are Peaches, three are Orange Nectarines, and two are white-fleshed Nectarines." It is not necessary to cite more illustrations of the fact that Peaches and Nectarines are varieties of one and the same stock. Numerous confirmatory cases have been cited in our columns, and a short *resumé* of the subject is given in the first volume of Mr Darwin's *Variations of Animals and Plants under Domestication*. Mr. Darwin thus sums up—"We have excellent evidence of Peach stones producing Nectarine trees, and of Nectarine stones producing Peach trees—of the same tree bearing Peaches and Nectarines (such Nectarines reproducing Nectarines by seed), as well as fruit in part Nectarine and in part Peach; and, lastly, of one Nectarine tree bearing half-in-half fruit, and subsequently true Peaches. "From these facts it has been concluded that the Nectarine is a variety of the Peach, which may be produced either by bud variation or from seed."

GREENHOUSE PLANTS.

THEIR CULTURE AND MANAGEMENT.

THE CAMELLIA.—Amongst the immense number of flowering plants that have been introduced into this country, it would be difficult to point to one that surpasses the Camellia either in the general estimation in which it is held, or in its adaptation to the various purposes for which flowers are required. True, neither the plant, taken as a whole, nor its individual flowers, can lay claim to the graceful elegance possessed by many things in cultivation; yet, in a well-grown example of Camellia, especially a white variety, clothed with its chaste flowers, backed by ample, glossy, deep-green foliage, there is a massive grandeur that has few equals. Neither do the flowers individually, when fully blown, and grouped with the choicest productions of the stove or Orchid-house in a vase or epergne, or the half-open buds that grace a bridal bouquet, lose by comparison with the fairest of flowers grown. When we add that, if desirable, the flowers may be had the whole year round, and that the plant is easily grown, and with fair treatment will last individually half a century, we have an assemblage of good properties that place it in the front rank of flowering subjects.

The first of the species that found its way to this country came before the middle of the last century; but it was about 1824 when the double white (*alba plena*), and the red semi-double *reticulata*, made their appearance, that their value was fairly understood. These were followed by numerous others, of more or less merit, and from which collectively have sprung the numbers of grand varieties we now possess, and which have so well rewarded the care and patience of the seedling-raiser. Some of the semi-double varieties seed tolerably freely, and the seeds can be induced to vegetate without difficulty; but this raising of new varieties may be safely left in the hands of those who interest themselves in this kind of work, and it will be better to confine these remarks to the general details of cultivation.

Camellias strike readily from cuttings made of the half ripened shoots, but the more usual and also more satisfactory method of increase is by grafting on some of the free-growing single kinds; but this work, also looked at from an economical point of view, either as regards time or cost, will be generally better left to those who make the propagation of this and kindred subjects their business. In the selection of young stocks to grow on, there are two things to be kept in view, first that the plants are in a free vigorous state, not pot-bound, and that they are of the right shape. Quantities of the young plants sold are wrong in respect to the latter essential. They usually consist of a single shoot, inserted in the stock some 6 inches above the collar, and allowed to grow on with a leading stem, from which, at 10 or 12 inches above the pot, proceed several weaker shoots, that seldom get a chance of attaining their wonted strength through the leading shoot being allowed to run away with more than its share of sap; the result of which is that in after years these side branches die off, and leave the plants naked and bare at the bottom, whereas, if at the proper time the leader had been stopped, so as to induce the production of three or four shoots of

FIG. 59.—PEACH AND NECTARINE ON THE SAME SHOOT.

But there are, nevertheless, other sounds that haunt a garden and make it full of life, and I half wonder that I have said so little of the birds that give almost as much pleasure as do the flowers themselves. When I last wrote I spoke of the swallows that build in our porch. This year a second nest has been hung there, and the birds dart in and out with a swiftness and a grace which nothing I know of can pretend to rival.

Mr. Courthope in his "Paradise of Birds" makes a nightingale boast that a bird is better than a man, for—

"He never will mount as the swallows,
Who dashed round his steeples to pair,
Or hawked the bright flies in the hollows
Of delicate air."

Few modern poets have written four lines so exquisite

Nothing can be truer, nothing better said, nor can anything close more pleasantly these garden notes of to-day. II.

PEACH AND NECTARINE ON THE SAME BRANCH.

NOT long since we received from Mr. Blair, of Shrubland Gardens, a branch bearing a Barrington Peach and a Nectarine, a representation of which is given at fig. 59. Peter Collinson, in 1741, was the first to record a Peach tree producing a Nectarine. Sir James Smith described the more remarkable case of a tree in Norfolk which usually bore both perfect Nectarines and perfect Peaches, but during two seasons some of the fruits were half-in-half in nature.

equal strength, and these in their turn were again timely shortened to cause them to breakback, the foundation for a well-shaped specimen in the future would be laid. Half the Camellias we meet with are spoilt in the early stages of their existence for want of sufficient use of the knife, traceable to a reluctance to sacrifice any growth that has been made, unmindful of its being rightly placed, or otherwise, with a view to the subsequent shape of the plants. The Camellia is naturally of a bushy habit, and for general purposes is much best grown in this bush form.

If young plants are procured early in the spring, just before they begin to grow, they may at once be placed in a night temperature of 55°, allowing the heat to rise 10° or 15° in the day time, keeping the soil well moistened, and syringing overhead once or twice a-day, as the Camellia requires to be kept, especially during the growing season, moister at the roots as well as in a more humid atmosphere than most hard-wooded plants. Previous to the commencement of growth the branches should be tied out, so as to admit light to the centre of the plants, and to give them the required shape; but in this training the shoots must not be bent down to a horizontal position in the way advised with most hard-wooded subjects, or it will most likely have the effect of stopping the points of the branches from extending further, causing them to break back in a way neither requisite nor desirable with plants that from the first have had their growth properly regulated. In the case of any branch that is stronger than the others, it will be well to tie such down a little lower, which will tend to strengthen the rest, and when growth has fairly commenced any shoots that show a disposition to take an undue lead should be pinched out, which is much better than letting them grow on to the end of the season, and afterwards cutting them back, as it is a waste of strength, as well as a sacrifice of time, in getting the plants up to a useful size.

During the growing season they will need a thin shade, to protect them from the direct influence of the sun; but, nevertheless, they must have plenty of light, and not be stood too close together. To over-shading and overcrowding through the growing season may be attributed the unsatisfactory condition that these plants are often met with in. Give a moderate amount of air in the early part of the day, shutting up soon enough to secure, by the help of the sun, a warm, close atmosphere in the evening. When the shoots have ceased to extend further, the flower-buds will form in the points. As soon as these are fairly distinguishable pot such as require it; for although the Camellia is a plant that does not need or will not bear so much root-room as many things, they must not be allowed to get pot-bound. Supposing the plants are in 6 or 8-inch pots, a 2-inch shift will be enough. They will thrive in either loam or peat; the latter induces more luxuriant foliage, with a greater disposition to growth; but good turfy loam is preferable, as it does not so soon get exhausted, and the plants usually flower freer in it. The turf, cut about 2½ inches thick, should be stacked before use sufficiently long, but not more than necessary to allow of the roots of the grass dying, for if these are further decomposed the plants do not grow so freely in it, and the soil is more liable to get into an adhesive state before fully occupied by their roots. It should be broken by hand, into pieces about the size of small Walnuts for young stock, and larger for such as are older; add sand in proportion to the more or less sandy nature of the loam, bearing in mind that it is a plant that should never need shaking out, or any considerable portion of the soil removing, consequently enough sand should be mixed with it to insure continued porosity.

Before moving the plants from the pots they occupy, see that the balls are quite moist. If in good condition the roots will be closely interlaced round the ball, often enveloping the drainage material, which should be removed completely; disentangle a portion of the outside roots, so far as can be done without much breakage—they are very brittle; drain well with clean crocks, covered with some of the turfy matter selected from the soil, so as to effectually prevent the finer portion from getting down amongst them. In potting, ram the new soil to make it quite close and as solid as the ball. If this is not done, when water is given it will pass off through the new material, leaving the old quite dry, in which case a sickly condition of the plants will follow. *T. Baines.*

(To be continued.)

A SHADY ROCKERY.

LAST year we had a piece of wild uncared-for land underneath the shade of large trees, and which we wanted to convert from a wilderness to a garden, so we made a rockery there. It is neither a "natural" nor a Battersea ornamental one, but a useful and true home for many of our wild wood plants; in fact, we built the house for the inmates' comfort, and not for the beauty of its architecture. We meant it for shade-loving plants and early-blooming ones that come into flower before the tree leafage is developed, and so far our work has been a decided success, judging from the increased strength and luxuriance of the plants therein planted. Of course there are a few sunny places where are growing those subjects that prefer such a location. This rockery covers a space of 860 square feet, is in mound fashion, traversed by stone-edged narrow walks, from which we can conveniently reach every plant, and has a maximum earth height of 4 feet.

The soil is all odds and ends of rubbish earth—muck, old potting soil, vegetable rot-heap stuff, and, in fact, whatever we could scrape together to make up the heap. The stones are rough and shaggy lumps and slabs, the heaviest of which two men carried on a hand-barrow. They are arranged in pocket-fashion, firmly bedded in the earth, and the joints closely fitted. The pockets are 9 inches to 2 feet 6 inches square, as we prefer clumps to single plants irregularly formed and disposed, and the soil in them is level instead of sloping, thus preventing the escape of rain-water, and to a great extent the miseries of a dry summer.

In addition to the value of my own time, the cost of construction of this rockery was as follows:—Thirty loads of stones at 1 dol., 30 dol.; one team three days carting soil at 3 dol., 9 dol.; two men five days at 1½ dol., 15 dol.; total, 54 dollars.

The following is a list of our native (U.S.) hardy plants now growing in this rockery, and all of them are in the most flourishing condition. We have many others equally suitable, as our Ericaceous gems, but their absence is simply because they have quarters in another and more favoured location; besides, we have also quite a number of Old World plants:—

Cystopteris fragilis	Caulophyllum thalictroides
" bulbifera	Hedysarum boreale
Woodia ilvensis	Streptopus roseus
Adiantum pedatum	" amplexifolius
Aspidium cristatum var. Clintonia	Mitella diphylla
Asplenium Trichomanes	" Breweri
" ebonum	Houstonia cœrulea
" thelypteroides	" purpurea
Lycopodium lucidulum	" longifolia
Asarum canadense	Polemonium reptans
" caudatum var. hirtum	Allium Douglasii
" arifolium	" tricoccum
" virginicum	Gratiola
Arisæma Dracontium	Actæa spicata var. rubra
" trifolium	Veronica officinalis
Potentilla canadensis	Malvastrum coccineum
" var. simplex	Berberis repens
" tridentata	Cedronella cordata
Viola blanda	Tiarella cordifolia
" rostrata	Uvularia perfoliata
" canina var. sylvestris	" flava
" Patrinii	" grandiflora
" pubescens	" puberula
" cucullata	Pachysandra procumbens
" palmata	Clematis ochroleuca
" rotundifolia	Senecio millefolium
" canadensis	Lithospermum longiflorum
Galax aphylla	Hepatica acutiloba
Comelyna virginica	" triloba, six vars.
" erecta	Claytonia virginica
Jeffersonia diphylla	Clintonia borealis
Trillium, several species	" umbellata
Dicentra cucullaria	Anemone nemorosa
Corydalis aurea	Tradescantia virginica
Helonias bullata	Tolmiea Menziesii
Cyperus esculentus	Oxalis violacea
Sanguinaria canadensis	" var. alba
Trautvetteria palmata	Mertensia virginica
Epigaea repens	Mitchella repens
Smilacina bifolia	Synthyris Houghtonia
Convallaria majalis	Onosmodium Thurberii
Polygonatum giganteum	Hydraxis canadensis
" bitorum	Gelone Lyoni
Diphyleia cymosa	Harpella parviflora

F.

FOREST TREES OF CANADA.

[THE following notes are extracted from Mr. Rowan's excellent little book, entitled the *Emigrant and Sportsman in Canada* (Stanford):—

Coniferae.—White or Prince's Pine (*Pinus Strobus*). This is the Pine of the lumber markets. It grows everywhere in Canada, but owing to its value the best Pine has been long since cut away in the more accessible portions of the Dominion. Most of the lumber that now finds its way to other countries comes from the heads of those great rivers that flow

into the St. Lawrence from the northward, such as the Ottawa and its tributaries. The best of the Pine is squared in the woods, and exported in that shape under the name of "square timber." The smaller trees are merely cut in lengths, and called logs; they are generally manufactured in the sawmills into deals. This tree is the most valuable of Canadian timber. It finds its way into every carpentering establishment in Great Britain, is easily wrought, durable, and free from knots. The best shingles for roofing purposes are made out of split Pine, and the log canoes used by the lumberers are hewn out of Pine trees.

There are two other Pines in the Canadian forest, the Yellow Pine (*P. mitis*) and the Red Pine (*P. resinosa*). The latter is the most resinous of the Fir tribe, and is consequently very durable, the resin acting like paint in preserving the timber from decay. Neither of these trees are much lumbered at present, owing to the superior size and excellence of the White Pine. The old roots and knots of the Red Pine, which are of great weight and completely saturated with resin, are called "Pitch Pine;" they burn fiercely, give a brilliant light, and are much used for torches.

The Hemlock (*Abies canadensis*). This tree grows to a great size, second only to the White Pine among the Coniferae. Although considered an inferior wood for general purposes, and not known in the lumber markets, it is a valuable tree. In the first place the bark, which is thick and heavy, forms the chief ingredient used by the tanner in preparing hides. It is collected in great quantities by the back settlers, hauled into market when sleighing is good, and sold like firewood by the "cord" measure. The timber, though soft and inferior for general carpentering purposes, is the most durable of all wood when immersed in water; it is therefore used in building wharfs. Hemlock generally grows on undulating land, mixed up with Birch, Beech, Maple, and other hard wood; and the settler looks upon it as an indication of good soil.

There are two species of Spruce in the Canadian forest, the White Spruce (*A. alba*) and the Black (*A. nigra*); also a variety of the latter, called by the Indians "skunk Spruce," from its smell. The Spruce is excellent wood, and grows in immense quantities all over Canada. It constitutes the main article of lumber in certain districts out of which the Pine has all been culled. The lumberers raft it down to the sawmills in logs, where it is manufactured into deals, boards, clap-boards for walls of houses, laths, and twenty other things. The Black Spruce grows on rough and rocky places, and is in general a mark of bad or indifferent land; the White Spruce grows mixed up with hard wood and Pine on a better description of land. The bark of the White Spruce can be peeled off in the month of June with the greatest ease, and is used by the back settlers for roofing barns and shanties. The sportsman camping out in the summer knows the value of this bark in wet weather. From the young twigs of the Black Spruce Spruce beer is made—an abominable concoction, said, however, to be wholesome. The roots of this species are tough and supple; they make excellent ties, and are used by the Indians for sewing their bark canoes. Spruce sparks and crackles too much for firewood, but it answers very well in close stoves.

The Tamarac, called also Hachmatac and Juniper (*Larix americana*). A deciduous tree, almost identical with the English Larch. It grows in clumps in low-lying ground, generally in the vicinity of lakes, swamps, and beaver meadows. It indicates inferior land. A very hard, durable, resinous, and valuable timber; in great demand for ship timbers, knees, and so on. It also makes admirable railway sleepers. When dry it is capital firewood. Pendent from the boughs of this tree and of the Black Spruce hangs in festoons the moss on which the Cariboo feed in winter. It comes next to Cedar for fencing purposes, and the young trees run up straight and free from knots, and make the toughest of poles for canoeing and other purposes.

The Fir (*Abies balsamea*), called "var" by the settlers, is a pretty tree, but the wood is not much valued. In fact Canada is so rich in valuable woods, and there are so many kinds to choose from, that Canadians can afford to be particular and only use the best; however, it is used for making tubs, butter dishes, milk pails, and so on; it is a soft, easily-worked wood, and tasteless. The Fir, as we have seen before, grows everywhere, sometimes in clumps by itself, more often mixed with Spruce and hard wood. It grows very rapidly, but does not attain a

great age. Fir trees left in isolated positions by themselves generally blow down or decay. The smell of this tree is delicious; it scents the forest. The tender boughs form the most elastic, fragrant, and sleep-provoking of couches for the camper-out; and the balsam, which is found in large bubbles under the bark, is the best and quickest cure that I know of for cuts, scratches, and bruises, and it possesses the great advantage of being always at hand when required in the woods. Of the sixty or seventy varieties of trees in the Canadian forest, there is not one without its use; it may be said of them, in the words of the Psalmist, "In wisdom hast Thou made them all."

The Cedar or Arbor-vitæ (*Thuja occidentalis*) is the most remarkable wood in the Canadian forest, the most useful one to the settler, and, next to the White Birch, the most valuable to the Indian and the backwoodsman. It grows generally in wet places, and on the banks of lakes and rivers, and is by no means a sign of bad land. There are hundreds of square miles of Cedar forests in Lower Canada and New Brunswick, but, strange to say, it does not grow in Nova Scotia. This is the lightest and the most durable of Canadian woods. A bridge made of it lasts for fifty years without repairs, and a fence for seventy or eighty. Cedar, exposed to the air and clear of the ground, as fence rails, actually wears out before it rots. It is largely used for making shingles, also for telegraph-posts, gate-posts, sills of houses, &c. I think if its wonderful durability were better known in England it would be largely imported. A good woodman can split a Cedar log into boards of a uniform size, using no tool but his axe. It is very useful in the backwoods for roofing sheds, barns, and camps. The bark peels off in long strips, and when green is as tough as leather, and makes excellent ropes. The Cedar is a very pretty tree, and grows to a large size. I have seen it in the Bay of Chaleur from 3 to 4 feet in diameter at the butt. The scent of the timber is delicious.

Betulae.—Black Birch (*Betula lenta*) grows in dry undulating land, and is a very common forest tree in Lower Canada and the maritime provinces. It indicates good soil, and is generally found in company with the Yellow Birch, with the Maple, the Beech, the Hemlock, or the Pine. It is valuable, but, owing to its great weight, hard to bring to market. Birch timber will not float down the streams when green, and consequently has to be cut a year before it is rafted. The wood is dark in colour, pretty in the grain, and much used for furniture. It is used to make keels for wooden ships, and for other purposes in shipbuilding and machinery, where strength, hardness, and durability are required. A great deal of Birch timber is exported to Europe; it makes capital fuel.

Yellow Birch (*B. excelsa*). This is like the Black Birch, both in foliage and quality of timber, but smaller. It is abundant in Canada, and is chiefly used for firewood. When bled in the spring the sap makes good vinegar.

White Birch (*B. alba*). The general character of a North American forest is dark and sombre, but wherever this tree occurs it helps to light it up. Its tall, graceful stem of pure white forms a charming contrast to the Spruce and other trees it grows amongst. It is very hardy, and is found the farthest north of the deciduous trees. The wood is inferior, and not much used even for fuel; but the bark is a treasure to the Indian and the backwoodsman. The former makes his canoe of Birch bark, his wigwam, his troughs for holding water and collecting the sap of the Sugar Maple, his torches for spearing fish, and the numerous little ornamental wares he brings into market. Formerly the squaws cooked their food in bark cauldrons, in which water was brought to the boiling point by putting in a series of red-hot stones. The back settler uses Birch bark for roofing purposes, and it is highly prized in house-building; a layer of bark under the clap-boards makes a very warm and comfortable house. The Indian wigwams, made entirely of Birch bark, are perfectly tight in all weathers, and very warm. But perhaps it is in kindling fires and making torches that Birch bark is most valuable. Without bark it is very hard to kindle a fire in the woods in wet weather; but the bark is always dry and always inflammable. Often and often the backwoodsman would have to spend the night in the woods were it not for the Birch bark torch, which serves to light him home to his camp. Out of it he makes his plates and his drinking cups.

(To be continued.)

Natural History.

THE CUCKOO.—It may be interesting to some of your correspondents to know that here, in a pied wagtail's nest, was reared a fine young cuckoo. At the end of the fruit-room the wall is clothed with Ivy, in which a nest of young thrushes was reared, and after the thrushes had flown a pair of wagtails took possession of the old thrushes' nest, and built their own nest inside the larger nest, and in this nest was the young cuckoo hatched. As soon as it was nicely fledged I removed it into a box, and placed a piece of wire netting over the front to make it answer the purpose of a cage; the meshes of the wire admitted the wagtails into the cage, which they kept quite clean. Here they continued to feed the young cuckoo for more than a fortnight, taking scarcely any notice of men working within a few yards of the cage. Whilst in the cage it had many admirers, and would peck any one's fingers put to it. Towards the middle of the month of August it seemed to be impatient of confinement, and so on the 18th we opened the cage, and it flew to some high Elm trees, and here the old wagtails soon found it, and they continued to feed it till the 29th, which was the last day I saw it. For the first day or so after it was liberated it seemed to be rather shy, but after that time it would allow of a very near approach. Your correspondent (p. 270) seems to say that cuckoos are known everywhere in England at least to be very fond of sucking other birds' eggs. I myself have very great doubts on the subject. I have never been able to ascertain any one instance of any one catching the birds in the act. After long observation I come to the conclusion that insects form their chief food, as I have seen both old and young ones busily engaged catching them. That the young cuckoos are always reared in soft-billed birds' nests goes, I think, a long way to confirm that conviction. Is not the cuckoo often blamed for what jays, squirrels, snakes, &c., do? I this season knew a hedge-sparrow's nest which contained, in addition to three of its own eggs, a cuckoo's egg, which I watched with great interest, and I was much vexed to find soon after they were hatched that the jays had destroyed them. The young cuckoo perished with the rest. The most mysterious part is, what becomes of the young birds that are hatched with the cuckoo? We read of the young cuckoo being provided with a hollow in its back, in which it gets the other occupants of the nest, and then tucks them over the side of the nest. Whether it is so or not I cannot say positively; but this much I do know—you may look in vain for the young birds hatched with or about the same time as the cuckoo, either inside or outside the nest. In conclusion, I may add that I have reasons for believing that the old cuckoo visits the nest in which she has deposited her egg. *W. E. T., Stanmore, N. IV.*

Foreign Correspondence.

SALT LAKE CITY, UTAH: August 7.—As for me, I never worked harder in my life, and the incessant travelling, collecting and packing adds enormously to the drudgery. I am very pleased to have seen what I have of the trees, and especially of the Pines, of Colorado. The association of so many species is a feature quite new to me, and such as exists nowhere else. To find eight or ten *Coniferæ* on one mountain is a marvellous feature in vegetation. Thus, in Colorado, we have, between 5000 feet and 10,000 feet, *Pinus edulis*, *ponderosa*, *aristata* and *flexilis*, *Abies Douglasii*, *Menziesii* and *Engelmanni* (varieties of one), *Picea concolor* and *Juniperus virginiana*, *occidentalis* and *communis*, all abundant. Of these, except two of the Junipers, none are found east of the Rocky Mountains. Of other plants I have collected as diligently and largely as I can, and have some 500 species from all elevations of 4000 feet up to 14,000 feet. Hence we are going into the mountains east of us (the Wahsatch, east of Salt Lake), which will give us a glimpse of West Colorado vegetation, and perhaps we shall find *Pinus monophylla*, which replaces *edulis* and extends west to Nevada, getting to the Taxodium Grove by the rear by Carson and Silver City (off the line of rail), and so by Calaveras and Monterey to San Francisco. Thence I hope to visit the Red-wood (*Taxodium*, &c.) district to the north and Monterey to the south, and then home by the end of September.

I am pulling through pretty well, though completely covered with bruises chiefly from tearing on mule or horseback through the Aspen brakes on the mountains and slipping on stones. I got up to 14,300 feet on Gray's Peak without difficulty on my legs, but I have not the wind and muscle I had, and, indeed, the mountain climbing is pretty severe work. When near the top of Gray's Peak in a severe hailstorm, the electric fluid fizzed out of the side of my head like the fizz out of a half-drawn soda-water bottle, followed by a loud clap of thunder. Soon after I had a shock in my arm, followed by another clap. The fluid also fizzed from the horses' ears, and one of my companions had so severe a shock that he did not recover for two hours. *H.*

BOTANIC GARDENS, CAMBRIDGE, MASS., U.S.A.—*The Colorado Beetle.*—The likes and dislikes of this voracious pest, as proved and noted in the gardens here, may be of interest to some of your readers. So far as I have observed the beetles confine their attacks to Solanaceous plants only, and they seem to have a decided partiality for the genus *Solanum*. *S. xanthii*, a somewhat shrubby and ornamental species, from Southern California, is their most appetising food, for notwithstanding rigid vigilance they keep these plants almost denuded. Then come in equal order the Potato—*S. tuberosum* and *S. capense*. Next is *Atropa Belladonna*, and in almost equal degree *Solanum Dulcamara*, but neither of these last two are much infested. The *Atropa*, however, suffered considerably for a month after being planted out, but now it is growing so luxuriantly as to appear less tasteful to the beetles. I find a few of the insects on the Tomato plants, but not enough to injure them, and I believe were the Tomato plants not in proximity to other infested Solanaceæ they might have escaped untouched, and I am confirmed in this belief by having a few Tomato plants in another part of the garden, and on which I have been unable to find one beetle. I may remark, however, that last year, when these insects were fewer, and in the absence of *S. xanthii* and *tuberosum*, they preyed heavily and exclusively on *S. capense*. Nor is their distribution this year owing to the presence of the Potato, as there is not a Potato plant within 400 yards of the other plants referred to.

Several species of *Solanum*, such as *robustum*, *atropurpureum*, *nigrum*, *aculeatissimum*, *Pseudo-Capsicum*, *Torreyii*, *jasmoides*, and others, growing alongside of the infested plants are untouched, as are also the following genera:—*Physalis*, *Nicandra*, *Capsicum*, *Datura*, *Nolana*, *Cestrum*, *Lycium*, *Nierembergia*, *Nicotiana*, &c. *F.*

Notices of Books.

Ferns: British and Foreign. By John Smith, A.L.S. New and Enlarged Edition. London: Hardwicke & Bogue, 192, Piccadilly.

This is a new edition of a useful reference book, giving the names, according to Mr. Smith's views, of the Ferns cultivated in gardens. There is a history of the introduction of exotic Ferns, and remarks on organography and classification; but the principal part of the 450 pages is occupied by the list of garden Ferns, which is accompanied by generic characters and woodcut illustrations of each genus. Some thirty-three pages of appendix devoted to Ferns introduced since the work was first published form the difference between this edition and the last.

Practical Dairy Farming. By G. Seaward Whitcombe. "The Bazaar" Office, 32, Wellington Street, Strand, London, W.C.

This is a handybook, of small cost, by a writer who has been among dairy cattle all his life, at all seasons early and late, and practically engaged in the details of their management. He treats the subject of dairy farming in the following order:—First, the farm; secondly, the management of dairy cattle; thirdly, the rearing of young stock; fourthly, the manner of letting dairies, as practised in Somersetshire and other southern counties; fifthly, the making of butter and cheese; sixthly, the breeding and feeding of pigs, which are the necessary scavengers of dairy farms.

A dairy farm, the author says, may be entirely in grass, or it may be arable land managed on "the soiling system." No practical man would plough up

rich pastures, but Mr. Witcombe very properly points out that a large proportion of the old cow pastures are poor and would produce more under the plough. We entirely agree with him that, so far as the economy of land is concerned, all poor pasture should be converted into arable; there is, however, the economy of labour as well as land to be considered, and that is a serious consideration just now. We should prefer ploughing up a portion of the grass land, and enriching the remainder; and, in point of fact, the most profitable dairy farms are of this class. During the summer, Tares, Trifolium, Clover, and Cabbages, are eaten upon the grass land, very much to its advantage, and the arable is enriched with artificial and "town" manures. The other crops recommended for soiling are Lucern, Sainfoin, Rye, and Comfrey. The crops for winter use are Parsnips, Swedes, Carrots, and Mangels. We think that in a future edition of the work a chapter should be added on the cultivation of these crops, and on the kind of soil they each require. On deep, rich land, the Parsnip is the mainstay of the dairy farmer; the Carrot has its special soil, and the Mangel—a less nutritious crop—is less particular as to soil, and only asks for as much manure as possible. The Cabbage, too, must be heavily manured. In fact, the quantity of manure required to produce heavy crops for "soiling" must alone render the mixed system preferable, except in the neighbourhood of towns, whence an *ad libitum* supply of manure can be obtained. Cows yield the least amount of manure in proportion to the food they consume, and light forage crops are the least profitable of any, their cost per ton being in proportion to their yield per acre; hence it follows that all the land under the soiling system should be very highly farmed, and how is this to be accomplished when all the land is in arable, unless manure can be imported, or made upon the spot by means of fattening stock?

The chapters on buildings are illustrated, and the plans appear to us to be excellent, and the dimensions of the sheds and stalls arranged by an experienced hand. There is good advice as to the breeds of cows which are best adapted for the dairy. The chapters on the management of cows and the rearing of young stock are altogether trustworthy. A page and a half is given to the subject of "utensils," and three and a half pages to that of "butter and cheese making." We have seen more space occupied and less information given, still we think that, considering the nature of the subject, the pig, with his dozen pages, seems to have been exalted beyond his legitimate deserts. We have, however, 90 pages in all, closely printed, and full of valuable information.

PUBLICATIONS RECEIVED.—Science Gossip.—Grevillea.—The Florist and Pomologist.—The Gardener.—Descriptive Catalogue of the Timbers and Economic Woods of Victoria.—Descriptiones Plantarum Novarum, &c., auctore E. Regel.—Teratological Extracts, P. Magnus.—Catalogus Plantarum Serbie, Bosnia, Hercegovine, Montis Scodri (Montenegro) et Albanie.—Claudiopoli (Klaassenburg).—Le Moniteur Horticole Belge.—Hamburger Garten Zeitung.—Relazione sui Cotoni Coltivati nel orto Botanico di Palermo, per Agostino Todaro, with coloured plate of *Gossypium microcarpum*.—Floral Magazine.—Botanical Magazine.—Journal de la Société d'Horticulture de France.—Revue de l'Horticulture Belge.—Monatsschrift des Vereines zur beförderung des Gartenbaues.—Synopsis Raborum Germanie, von Dr. W. O. Focke (Williams & Norgate)—A Critical Study of German Brambles. The author admits about 130 species and sub-species. In accordance with his principles there is surely no reason why this should not be multiplied by 100 or 1000. Certainly he will not find two plants exactly alike.—State Forestry: its climatic and financial aspect. By Captain Campbell Walker.—Mr. Darwin on the Fertilisation of Flowers, by Thomas Meehan.—The Clematis as a Garden Flower, by T. Moore and G. Jackman, new edition.

The Villa Garden.

LAYERING CARNATIONS AND PICOTEES.—This work may be done up to the middle of September, but a nurseryman who grows a large quantity of plants in pots sets about it early in the season, in order to have plants for sale as soon in the autumn as possible. We have been growing a collection of choice Clove Carnations, and very useful they have proved as border flowers for cutting from; and the supply of blooms is by no means exhausted yet. But we are

layering some of the best grass at favourable opportunities. The layers of vigorous growing Cloves will soon strike root; but it is very different with delicate-growing Carnations and Picotees, some of which are very slow to take root.

When we proceed to layer it is not uncommon to notice that the growth of some of the plants has become so erect, and thrust up from the ground, that there is danger of breaking off the growths when they are bent down for layering. The best thing to do is to build up a bed of soil around the plant, using some pieces of brick to form the basin of the bed, till it is sufficiently high to enable the shoots to be layered. The act of doing this will probably kill the plant, but the layers will be saved.

Really there is very little difficulty about layering Carnations, Picotees, and Cloves. A sharp knife is necessary, and if the shoot (at the point at which it is to be layered) be cut through about half-way, a third or half an inch below a joint, and then be cut upwards a little way towards the joint, and then pegged down in the fine soil, it will scarcely fail to root. What unskilful layerers have to do, is to avoid snapping off the layer when it is brought down to the soil and pegged into position. A little practice, however, is of great advantage; and the art of doing it nicely and cleverly is soon acquired.

But there are often some shoots that cannot be layered, and as they encumber the plants the question is what is best to do with them. Last October we found ourselves with a number of these shoots, and being desirous of making plants of them, if there was any possibility of doing so, they were planted out in a bed with a quantity of rough red sand placed about the base of each, some two inches in the soil. During the winter these shoots began to make roots, and by the early part of the spring they put forth a vigorous growth, and eventually made good plants, and bloomed profusely during the summer. There was scarcely a failure. The shoots were from a strong growing variety, it is true, but many may be rooted in this way.

Any rooted layers of choice Carnations and Picotees should be potted off singly into large 60-pots, or a pair of plants in a 48-pot, as soon as they are ready for removal. A good yellow loam, some loam and leaf-mould makes a suitable compost, and the plants should be potted hard. Nurserymen who winter Carnations and Picotees in pots, pot very hard—the plants do best when so potted—and winter them in a cold frame on a dry bottom. If the plants stand on a wet bottom during the winter, the foliage is apt to be affected injuriously.

LARGE-FLOWERED PELARGONIUMS.—Owing probably to the moist, cool weather that has so long prevailed the duration of the blooming time has been unusually long, and such free-blooming varieties as Triomphe de St. Maude, Rob Roy, Heroine, Duchess of Cambridge, and Empress are still flowering, and appear likely to bloom for some time to come. A month ago a few of the earliest plants were cut down, leaving only a framework of the main branches cut back hard. They were then put by on a shelf of the greenhouse, and kept dry for a time. They have now commenced to break into growth, and in a few days they will be ready for repotting. The plants should be growing before they are shifted into other pots. When this is done the plants should be turned out of pots, the soil shaken from the roots, and the roots trimmed, cutting away the long stout roots, and then repotted in smaller pots than those in which they have been previously growing. This is the usual practice of all cultivators. Then another shift into the blooming pots will be given at the end of October, and the plants will be kept in a light, airy place near the glass all the winter.

The branches that are cut off at cutting-down time make excellent cuttings. We put them singly or in couples in small 60-pots, or small Tom's as they are termed, using a light free sandy soil. The pots are then stood by themselves on a shelf of the greenhouse, and kept sprinkled till they begin to root. Then a little water can be given, to keep the soil nicely moist about the young roots. We winter these young rooted plants in the cutting pots without a shift, and then by potting off the forwardest in early spring some nice free-branching, blooming plants can be had to flower during the summer. In early spring the leading shoot is pinched back, so as to induce the young plants to break into a bushy growth. When once the growing plants are shifted into 48-pots they

make rapid headway, and excellent cut-back specimens for the following year.

The fancy varieties, or the ladies' Pelargoniums as they used to be termed, are very pretty indeed, but being of a more delicate nature than the more robust growing large-flowering varieties cannot be so easily managed. The fact is, artificial heat is necessary at certain seasons of the year to keep them in robust health. The Villa gardener who has no heating apparatus had better let them alone, and confine himself to the large-flowering sorts. A selection of free-blooming varieties will yield an abundance of fine and continuous bloom.

PLANT PORTRAITS.

MASDEVALIA TROGLODYTES, Ed. Morr., sp. n., *Belg. Horticole*, 1877, t. 5.—A singular small-flowered species, with a cup-shaped perianth, whitish on the outside, reddish within, and prolonged into three long filiform spreading tails. The species belongs to the same group as *M. nycterina* and *M. chimera*. The column and the lip have a resemblance to a grotesque figure concealed in the cavity of the perianth, hence the name troglodyte. The plant flowered in the collection of M. Oscar Lamarche at Liège in December, 1876, and subsequently. It is a native of New Granada.

MESEMBRYANTHEMUM COOPERI, Hook. fil., *Bot. Mag.*, t. 6312.—A very handsome and free-growing species, with terete fleshy pointed glaucous leaves studded with pimples, and bearing a handsome purple flower 2 inches in diameter. It was collected in South Africa by Cooper, and flowers at Kew in June.

NOTYLLIA ALBIDA, Klotzsch, *Bot. Mag.*, t. 6311.—This is not likely to be a great favourite with Orchid growers, but is, nevertheless, not devoid of elegance. The habit is that of an *Eria* or a small *Aegæacum*, the small greenish yellow flowers being borne in dense pendulous racemes 6 inches in length. It was discovered in Central America by Warszewicz, and sent by him to Chiswick, since which time it has been reimported by Messrs. Veitch, from whose specimen the present figure was taken in April, 1872.

ODONTOGLOSSUM ALEXANDRÆ VAR. ROSEUM, *Floral Mag.*, t. 269.—A very handsome variety, with the sepals and petals flushed with rosy lilac. The plant figured is that shown out long since by Sir H. W. Peck at the Royal Horticultural Society.

ODONTOGLOSSUM KEGELJANI, Ed. Morr., sp. nov., *Belg. Hort.*, 1877, t. 10.—A species in the way of *O. triumphans*, with flowers 2 inches in diameter, with lanceolate yellow segments blotched with brown. The lip is oblong, abruptly acuminate, whitish, with a yellowish brown edge. The species is dedicated to M. Kegejian, of Namur.

ONCIDIUM MASSANGERI, Ed. Morr., sp. nov., *Belg. Hort.*, 1877, t. 6.—One of the paniculate yellow-flowered group; the flowers of medium size, the sepals and petals marked with brown blotches, the lip panduriform. The column is destitute of wings. It is allied to *O. fasciferum*; but, according to M. Morren, presents some differences from that species.

ORYTHIA UNIFLORA, Don, *Gartenflora*, t. 906.—The old yellow-flowered Ornithogalum or Gagea uniflora.

PEACH, GOLDEN RATHRIPE, *Bulletin d'Arboriculture*, June, 1877.—A Peach which our Belgian friends, misreading an ill-written label, at first took for Golden Catherine! The fruit is large, melting, highly flavoured, the earliest of the yellow Peaches, ripe in the middle of August. By some it is supposed to be the same as Yellow Admirable, but it ripens earlier.

PEAR, BELLE D'ECULLY, *Bulletin d'Arboriculture*, July, 1877.—A coloured figure of an early Pear, ripening in August and September. It is of large size, yellowish in colour, regular in form, with a shallow eye, and a short stout stalk. The flesh is white, melting, sugary, and with a vinous flavour. Does well on the Pear stock or on the Quince.

PENTSTEMON GRANDIFLORUS, *Natt., Gartenflora*, t. 900.—A tall-growing, pink-flowered species, to which the figure gives but scanty justice.

TRICHOCENTRUM TIGRINUM, *Ill. Hort.*, 282.—An Orchid, with the appearance of a *Miltonia* described in our columns in 1869, p. 892. The sepals and petals are strap-shaped, green barred with purple, lanceolate-acute, the lip deltoid, two-lobed, white, with a purplish spot at the base. It is a native of Ecuador.

BRITISH GARDENERS.

WILLIAM J. CROSS.

In the pretty little village of Whitechurch, on the banks of the Thames near Reading, the subject of our present memoir was born, September 10, 1832. His father, a poor but honest tradesman, strove hard to bring up a large family respectably, and to give them all the best education the neighbourhood afforded. "My own, however," writes Mr. Cross, "was poor indeed; for in the National School, to which I was sent, there was no grammar, geography, history—in short, nothing taught but the common rules of arithmetic, reading and writing. Our only two books were the New Testament and the five books of Moses, excepting a "Dialogue" between William Walker and Thomas Brown on the subject of getting a boy christened—the one asking the favour of the other to stand godfather. A better school was looked out for me, but one morning, when on my way to read this silly story in my fourteenth year, I met a man looking for boys to hold up little forest-trees for the planters. I went, and, having spent a season at that work, my master and father made arrangements for me to go into the gardens of S. W. Gardiner, Esq., Coomb Lodge, in the same parish. A premium was paid, and my wages were to start at 2s. per week.

The gardener, Mr. J. Piggott, was what is known as a good old-fashioned gardener, and the gardens, although small, were under his management productive. Good Pines, Melons, Cucumbers, excellent Grapes, and plenty of forced and common vegetables, formed the usual supply to the house. He used hot dung properly prepared with good effect, and, I believe, sent away all his young men ignorant of thrips and mealy-bug. My scanty income was in due time raised to 4s. per week, and, having the apprentice's privilege—that of killing the rats of the place at 1d. each—I began to lay out plans for myself. My fancy for gardening soon grew into an intense love for it, and my duties by night and day gave me the greatest pleasure. A sharp frosty night compelled one or the other to remain on duty nearly or quite all night, but my lodging a mile from the gardens made this duty hard and wearying, so that it can hardly be wondered at, that on one cold November night I found myself floundering about in an open tank in the centre of the gardens, containing several feet deep of water, having walked in asleep on my way to the Pine-house fire.

"My first spark of garden literature, in the shape of McIntosh's *Practical Gardener*, I bought with my rat-tail pence. A description in the *Floricultural Cabinet* of some wonderful Fuchsia or other plant, and an occasional peep into the *Gardeners' Chronicle*, increased my strong desire to progress. I owe a deep debt of gratitude to Mrs. Piggott, a very ladylike person, and sister to Mr. T. Webster the artist; her many kindnesses and advice to me at a time when my troubles ran high, will ever be remembered and appreciated by me.

"Having spent one season weeding and several in the stokehole and houses, and in serving the kitchen and kitchen gardening, I was considered a fit subject for a London nursery. Accordingly in the spring of 1851 I was placed in the Pine-apple Nursery under that best of all propagators, the good old Mr. Fancourt—a man hardly to be equalled in the art of increasing hard-wooded plants. One day I asked him to what did he consider his great success mostly due? He replied, 'close observation.' 'Observation,' he continued, 'will enable a man to propagate and grow any plant living.' Although his work lay principally under bell-glasses, yet for the principles of plant-growing there is no man to whom I owe so much as to him. My wages at that time being but 8s. per week I could not do much in what I so much desired—self-improvement. My handwriting being considered suitable for seed-packets I was ordered, with four or five others, to write each evening till 8 o'clock, but no extra pay was allowed for it. Being already a member of a Mechanics' Institute, I begged off on certain evenings weekly to attend it, and this was readily granted. From one department to another I went with a small increase of wages, till I was made foreman of the soft-

wooded propagating department, including choice hardy shrubs and Tea Roses, with the assistance of one little boy, and pay 15s. per week. My staff soon increased to six or eight men. This position enabled me to satisfy myself as to the value of large pots for soft-wooded specimen plants applied in the early stages of growth—what is known as the one-shift system—which I am convinced is the true principle for the production of handsome plants. My evenings now were my own, and were devoted to education—practical geometry and music forming part. I attended all the lectures possible on a variety of subjects. Before leaving London I must have heard some hundreds by clever men, but, I regret to say, not one did I hear, or hear of, on botany or any branch of it. My lessons on geometry were taken in a class; then at my lodgings, when all the inmates of the house had gone to bed, I worked out the problems, and copied them, with definitions, into a large book, and carefully lettered and described all through the course, in the hope my book would be a useful one some day. This work generally brought me into the small hours of the morning. I may mention that the tens of thousands of plants I had to produce were obtained principally by means of well-prepared hot-beds, which for speed, and for securing health and strength, I think

gardeners of the present day but the finished foremen of a few years back, who needed all the assistance and encouragement their masters could give them? Every one of such will remember with pleasure the man who gave him valuable instruction and encouragement as contrasted with those who practised a tyrannical authority discharging men by the dozen on the simplest fault, or with no fault at all, regardless of consequences.

"It was soon settled for me to go to Kinmel Park, North Wales, as foreman to the late Mr. Mountford, gr. to H. R. Hughes, Esq., where I remained two years. Soon after arriving there I found, to my great sorrow, my book of practical geometry was missing, never to be recovered. I hoped a letter to my last place would recover it, but it did not. At this place I grew a dozen tree Mignonettes 4 feet 6 inches high, with heads as much through; the leaves had almost the substance of Cabbage leaves all up the stem. Some plants were very graceful, and bore flower-spikes 13 inches in length. I had some little difficulty to convince Mr. Mountford that they were from an ordinary packet of seed. Mr. Barrow had some men at Kinmel Park lifting large trees, and his simple method of lifting a heavy ball with the tree perfectly upright was I thought worth remembering.

"During my stay here I began to form my little library, and learnt the art of entertaining myself in the long winter evenings. My duties at other seasons were hard, as often, while the Vines required so much attention, we worked from 4 in the morning till 9 at night. In fact the work went with but one change—from work to sleep, and from sleep to work. In the spring of 1858 I left Kinmel for London, to seek a situation as head gardener, and the following summer was sent by Mr. Arthur Henderson to manage a small garden for Mr. Nicholl, Cowley Grove, near Uxbridge, Middlesex. This gentleman was an ardent lover of his garden, and I spent two very pleasant years with him. While there I wished to try an experiment with some plants of free growth, to test the principle of raising the temperature about mid-day to the highest degree possible by sun-heat. Accordingly I selected some young Fuchsias struck the previous autumn, and by this time in 6-inch pots. I shifted them into 16 or 18-inch pots, using rough rich soil and free drainage, and placed them on a bed of warm tan some time in March. Ventilation was given as usual in the morning when the temperature rose high enough, but at about half-past 12 o'clock I shut all up as tight as possible, and syringed away pot after pot of warm water all over plants, pots, glass, walls, and all surfaces till the house in the full blaze of the sun rose to 120° or more, and was charged with all the vapour possible. I locked it up to make sure no one could open the door by any chance. At about 6 o'clock I gave an inch of top air to every sash, and during the evening increased it so that the tem-

perature would stand through the night at about 60°. This treatment was followed up for two or three months, when the plants were taken out for conservatory decoration. Their growth was remarkable for thickness of wood and leaves. The leafstalks on the main stem were much shortened by the wood burying them in; they broke at every joint, these being extremely short, and branched again and again till without stopping a shoot they became a thick pyramid, and during the summer and autumn flowered abundantly at every point. When carried out of the conservatory to let in Chrysanthemums they measured from 6 to 14 feet high according to habit. I was much pleased with the result.

"In the year 1860 I went again to Messrs. A. Henderson & Co.'s nursery to wait a better situation, and in the autumn of the same year was engaged as head gardener to A. J. R. Stewart, Esq., Ards, Co. Donegal, Ireland. Here I had a good staff of excellent men and a good garden, and was much pleased with the wildness and natural beauty of the place. Five or six vineries were still holding their crops, but not one bunch of Grapes was fit for table. The roots of the Vines ran outside. The next season, having all ready for a good start, I loaded the borders with 18 or 20 inches of stable dung, which was well attended during the season, and the inside properly

cannot be equalled by any other kind of heat. In search of further information I decided to leave London for the country, and was engaged to serve Mr. Scott at Leigh Park, Havant, Hants, in the houses, leaving one guinea a-week, with the promise of a rapid advance, to accept 14s. This engagement did not turn out a happy one, for in a month or two I was discharged at a moment's notice—to leave the place the same night—for stopping a few Calceolarias, some of which were being stopped daily as they grew long enough. This sudden change drove me to lodge at a dirty public-house till it could be settled what my next step was to be. But for the kindness of Mr. Arthur Henderson my gardening career might have been sadly interrupted, and perhaps, as is the case with many young men, cut short. I think head gardeners have a duty to perform, and a responsibility in the management of young men, which should be seriously felt. I do not believe in the degeneracy of the rising generation of gardeners, but I think there is evidence enough to prove that even better results will be obtained by them when the present head gardeners have passed away. Suppose only one young man in ten is promising: is he not sufficient to carry away one's best practice, and add that to the practice of the other good men? What are the best head

cared for as to ventilation, &c. The result was five houses of good black Grapes and one of Muscats. The next season the bunches came much larger, without disturbing a root. This garden was remarkable for a very fine collection of Pears planted by Mr. McLachlan, a good gardener, once at Ards. The climate of the North of Ireland seems most suitable to a clean healthy growth and large well-finished fruit.

"In 1862 I left Ards for London once more, and was destined the same autumn to come to Melchet, being engaged by the late Lord and present Louisa Lady Ashburton. Besides the management of the garden much more important duties fell to me about the new mansion, which was begun the following spring by H. Clutton, Esq., architect. Under him I carried out extensive ground-works during several years, such as the terraces, carriage road, &c. Having a love for trees, and a dislike to destroy any, Lady Louisa ordered me to transplant. Now the recollection of Mr. Barron and his excellent plan became of use to me. I was allowed to purchase one of his machines, and transplanted many trees weighing from 1 to 6 tons without a single death; they are all, in fact, at this time more vigorous than ever. I found some little difficulty in removing smaller trees and shrubs of from 10 to 15 cwt.; and consequently for this purpose I had a truck made which when attached to the ball, the young tree is lifted by the horse pulling down the shaft, causing the tree to swing up on to the bed of the truck in a perpendicular position. When drawn to its destination, the operation of lifting is reversed with much ease and speed, the tree being readily planted without the slightest risk. About this time the valuable and interesting collection of plants was begun to be formed, and many soon grew into size. Among the plants I have raised may be mentioned *Actinopteris radiata* from spores, for which the Royal Horticultural Society awarded me the Silver Flora Medal; hybrid *Cypripedium Ashburtonæ* and *Crossianum*, also *Harrisianum*, but in this last Mr. Dornay was before me. [Good Grape and other fruit growing was not lost sight of.

"In 1869 I left Melchet and was engaged as gardener to the Rev. S. Phillpotts, Porthgidden, Cornwall, a gentleman possessing much horticultural knowledge, and a profound lover of his garden, in which there is a great deal of glass, a nice collection of plants, and good fruits. Here I applied my usual remedy to exhausted Vines, namely, a heavy coat of stable dung and due attention to the inside of the house, with excellent effect. On the walls are two Pear trees remarkable for their large size—*Glou Morceau* and *Beurée Rance*. The estate is exceedingly pretty, and situated on the banks of Falmouth harbour. I remained at this place very comfortably for two years, when arrangements were made for me to return to Melchet to my former post. Here I found most of the garden buildings swept away and new ones erected, besides a new kitchen garden formed. During my absence the big Lily and *Phalæopsis* had been awarded each the Lindley Medal when exhibited at South Kensington.

"Through the kindness of Lady Louisa I have exhibited plants and fruits successfully. The last time I exhibited plants I won at Southampton the cup I prize more than all I ever was awarded, inasmuch as we carried off the laurels, beating a large collection brought from Leigh Park, the only place (I must own it) I ever owed a grudge to."

PLANT GOSSIP.

On a lawn near Stanmore, *Galium saxatile* has gradually ousted the grass. It is said to be somewhat less easily mown by the machine than grass, but it forms, nevertheless, a nice elastic turf.

— An inspection of the Rev. F. D. Horner's fine collection of Auriculas, at Kirkby Malzeard, shows them to be in fine condition, and as usual full of promise. While information is reaching us from other quarters that the Auriculas are getting usually active at this season of the year, the Kirkby flowers have reached that period of pause which comes between the summer and the autumnal growth. It is no doubt very pleasant to cultivators to have lively plants in early autumn, but it almost always means mischief, it results in a premature autumn bloom. The Auriculas at Kirkby are quite as large as they ought to be, and they are particularly quiet; much of their

work has to be done. The autumn growth should commence in September, and continue to the first week in November. It may be perhaps because Kirkby Malzeard lies in one of the latest districts of England, but as a general rule the plants do not begin to make their autumn growth till September. They are now in the raised frames under the cool north Ivy-clad wall in the vicarage garden, and there they will remain till they are housed for the winter at the end of November. In wet weather the lights are kept over the plants, but air is freely given on fine days, of which but very few have been experienced of late in the North Riding of Yorkshire; the lights are pushed back, and air freely given. The soil about the plants is kept fairly moist and no more, and yet the pots are thoroughly full of vigorous roots. Such fine and scarce varieties as Alderman Wisbey, Booth's Freedom, and Taylor's Glory, are seen to have their leaves much mottled with yellow. This is not a sign of health, but the natural character of the leaves at this season of the year. The leaves of George Lightbody, a fine grey-edge, become slightly streaked with yellow in autumn. The seedling house is now a most interesting sight. A conspicuous feature is a line of some fifteen or eighteen selected seedlings of high-class quality, that are to be subjected to another trial in the coming spring. There are also some 2000 or more seedlings in all stages of growth—from the strongest, some of which are throwing up autumn trusses, to the very youngest, from seed sown in August last. Though the seed is saved only from the very finest varieties crossed with others of equal value, a great many inferior flowers are certain to result. Only a very small proportion indeed of cracks can be expected to come out of 1000 seedlings, and it often happens that flowers of otherwise fine qualities have the fatal defect of a pin eye; but these make valuable parents in many instances.

— Mr. W. Calverwell, of Thorpe Perrow Gardens, Bedale, has forwarded some flowers of a seedling white Clove Carnation, named Susan Askey. The flowers are large, full, pure in colour, and richly fragrant. It has a good habit of growth, blooms freely, and it is without the fault that spoils many otherwise good flowers—it never bursts its pods. It is one of those varieties that deserves to be grown for its flowers; which last for some time without losing much of their exquisite fragrance.

— *Crinum Moorei* is beautifully in flower in the cool end of the T range at Kew. Without doubt it is the finest species for greenhouse decoration. The flowers are large, of fine substance and form, ranging in colour from nearly pure white to deep pink. An important feature is the facility of its cultivation, requiring only to be potted at long intervals. It is nearly if not quite hardy, a specimen having remained fully exposed all last winter, and is now making strong growth.

— Which is the more elegant, *Tacsonia Van Volkemii* or its hybrid offspring, *T. exoniensis*? A matter of individual taste this, no doubt, but when we saw the two together at Hardwicke lately, we were disposed to yield the palm to *T. Van Volkemii*. Perhaps the hybrid is the more free-flowering of the two, but, in any case, no one would do wrong to choose either of them, and those who have room enough should have both.

— In the flower garden at Culford, near Bury St. Edmunds—a garden with a well-earned reputation—we lately saw a flower screen of a somewhat novel and brilliant character. It was formed of Canary Creeper, Sweet Peas, and *Convolvulus major*. When we saw it the *Tropæolum* was predominant, but it may easily be imagined how gay such a hedge would be when in perfection.

— The tuberous-rooted *Begonias* are brilliantly in flower in the cool end of the T range at Kew. Emperor, with flowers approaching those of *Vesuvius*, is much superior in habit and is really one of the finest. *Kallista* is also new but with fewer branches, though fine and distinct in colour. Dr. Masters, one of the earlier productions, still remains an essential, no other having appeared with equal colour and length of flowers. Orange Boven is distinct and desirable. *Chelsoni* is profuse in bloom, and branches to the extent of being a most effective kind, with flowers that

are not equal to many others. Comet, Rosette, *Vesuvius* and Prince of Wales are all highly effective. Starlight is one of Colonel T. Clarke's hybrids, and valuable from its quantity of white flowers. It is a cross between *Insignis* and *Pearcei*, but with little of the latter in its appearance. The original species are here of some importance. *B. roseiflora* is extremely pretty, but the colour, we believe, is not yet found among the results of hybridising. One, indeed, is an approach, but scarcely worth mention. *B. Pearcei* is splendid from its clear yellow flowers and rich foliage, perhaps not likely to be improved in this respect. *B. Veitchii* has grown with great strength, and is handsome, with large flowers elevated on stout stems. The old *B. Evansiana* is well worth attention from its large leaves and pink flowers. *B. Froebelii* is in flower from seed sown this year, and is of excellent colour, with fine ample foliage. *B. boliviensis* widely differs from other species, but from a decorative point of view is now quite superseded. Several other tuberous species are cultivated in the Royal gardens, though unfortunately one or two appear to have quite passed out of cultivation. The new *B. Davisii* is evidently of great value and merit.

— We do not know whether the circumstance is general or no, but the scarcity of fruit includes, in our experience, the *Aucuba* also. The male blossoms were severely injured by May frost, and especially by the unfavourable weather on June 1, and the consequence is that the berries did not form on the female bushes. On the other hand, the crop of *Pyracantha* berries is very large. Some prophets, with more audacity than sense, would argue from this that a hard winter was to be expected.

— On the south coast, as at Folkestone and Brighton, we have noticed the flowering of *Euonymus japonicus* year after year, but not until the present year have we observed any but exceptional flowers on the bush in the neighbourhood of London. This year, however, the shrub, and even the variegated variety, has flowered freely. What possible climatic combinations can have influenced it?

— In a front garden in one of the streets of the town of St. Albans may now be seen a thriving young plant of *Encalyptus globulus* 5 or 6 feet high, and which was unprotected last winter. Until lately a very young plant of the same or some nearly allied species might have been seen on the Thames Embankment, in the corner of a yard belonging to Messrs. Mioier, Nash & Co. As it has disappeared of late we presume the local circumstances were not propitious.

— Among deciduous climbers for covering walls *Cissus orientalis*, figured by us in 1871, p. 1615, should not be overlooked. A plant at Messrs. Veitch's shows a rich profusion of dark coloured elegant foliage. The new tuberous *Begonias* which have such a future before them, as they are highly decorative, easy to grow, and in many cases hardy, also form a very noteworthy feature in Messrs. Veitch's establishment at the present time.

Garden Operations.

PLANT HOUSES.

PLANT STOVE.—To grow *Luculia gratissima* when planted out in the manner it is capable of, and to produce its splendid flowers in the profusion in which they are occasionally met with, it must have an intermediate temperature—a description of house much less frequently met with than it once was, consequent upon the greatly increased number of fine-leaved plants that have been introduced and have found favour in recent years, that will not succeed without a high temperature and a very humid atmosphere. The absence of such flowering subjects as the above is much to be regretted, especially through the dull autumn months. Every one who has a house wherein a night temperature of 50° or 55° is kept up during the autumn and winter, with a corresponding rise in the daytime, and the summer-heat night and day in keeping with this, should grow this *Luculia*, more particularly if there is a back wall to cover, as it is one of the best possible plants for such a situation. When it happens to be grown under conditions where it receives a little more heat than it likes, I have found it less disposed to flower early, from an inclination to keep on growing. This may be checked by allowing it to get dry at the roots for a week or

two, which will sometimes cause it to bloom later in the autumn; but this checking process must not be carried so far as to injure the leaves. As soon as it shows flower it will be benefited by the use of manure-water. The splendid climbing *Hexacentris mysorensis*, although a native of the warm Mysore country, I have never found do so well in a hot stove as in the cooler temperature of an intermediate house, so here it makes a glorious plant for a rafter, and its large, pendent racemes of highly-coloured crimson and yellow flowers are seen to advantage, flowering much more freely, though later in the season than when subjected to more heat. It is naturally a strong grower, and if planted out should not have too much room. Where grown in pots, directly it begins to show blossom it will be greatly assisted by the application of manure-water. So treated I have had it continue blooming on to the end of the year. Grown thus cooler its flowers will be found much more useful for cutting than when subjected to hotter treatment. It should be closely cut in after blooming.

Hedychiums.—These stately flowering plants, so useful for conservatory decoration when in bloom, also do best in a medium heat; it is not well to let them get too large, as from their strong-growing, free-rooting habit when allowed to remain for years without division of the roots the soil becomes so exhausted that they do not flower so freely. In most cases they will now be done blooming, and where the plants are big enough may with advantage be divided. The way I have usually dealt with them is to turn them out of the pots and cut them in pieces with an edging-iron. A plant that has occupied a 15 or 16-inch pot may be cut into three or four pieces, accommodating each with a 10 or 12-inch pot and placing them where they will keep on growing through the winter. They will succeed in either peat or loam, but they usually flower most freely in the latter. *Mediolla magnifica*, and the handsome, newer *M. amabilis*, will be now about finishing their growth; this is easily seen by a stout bud being formed at the base of the terminal leaves, which acquire their full size and substance with no further disposition in the shoots to extend. When these plants have attained this condition they will be better through the autumn and winter in an intermediate temperature, and kept considerably drier at the roots. *Griffinias* that have been subjected to more air and cooler treatment since their growth was completed, will now be pushing up their flowers. They must not be kept too cool whilst these are advancing, and care should be taken in watering that the ascending bloom stems until they have got somewhat advanced are not wetted, excepting sufficiently early in the day for them to get dry before night, or they will be liable to damp. *Lachenalias* that flowered in the spring, and have now completed their growth, must have the supply of water gradually reduced, as when growth is fully matured the soil should be kept in almost a dry state until they show signs of again commencing to grow, either by being submitted to a higher temperature for forcing into flower during the early months of the year, or later in spring, when they come in more gradually. The species of *Gloriosa* or *Methonica*, when done blooming, and that indicate signs of going to rest, should have the water gradually withheld so as to cause their tops to die down by degrees. To succeed with these, as with all plants of a similar character, the moisture supply must not be suddenly cut off whilst the leaves and stems are yet green, otherwise they are sure to suffer and to show the effects by puny growth in the spring. When quite at rest they must not be kept too cool or damp; a shelf in an intermediate-house will suit them. Any plants of a tender character yet remaining in conservatories should at once be moved to warmer quarters, or they will be likely to suffer; but in doing this care must be taken not to at once subject them to a very high temperature, for even in the case of such things as require to be kept growing more or less through the autumn or winter, if at once placed in stong heat it will have the effect of exciting them too much whilst the leaves are more or less stagnant. *T. Baines*.

ORCHIDS.—As many of the plants will have in a great measure formed their new growths, it will now be necessary to give them a little more exposure to the light; and at the same time, on every favourable opportunity, give a free admission of air, as well as careful attention to the watering, in some degree withholding moisture from those that are in a forward state, so that by these means the bulbs may be hardened and matured, and thus be the better prepared to remain healthy and plump during the resting season, so that in due course the flower-buds may be formed, and ultimately perfect blooms may appear. Weak and thinly formed bulbs cannot bring such a show of blooms as those that are stout and thoroughly ripened, even if they are somewhat short. The aim, therefore, should be, instead of continuing the growth long into the autumn, to endeavour to perfect the medium-sized bulbs in preference to those which have a tendency to continue growing. The collection as a whole must also have less shade, the back blinds being only run down when it is absolutely necessary, and those

on the front side, or rather the side facing the south or south-west, should be run up in the afternoon as early as it can be done with safety. *Calanthes* will mostly have finished up their bulbs. The stout leaves, however, must be encouraged to remain on as long as possible, and the spikes as they form at the base of the bulbs must have support, and be treated so that they may start away with strength and vigour, and also be kept in a growing state, so that *Veitchii*, if the bulbs are large and sound, will reward the care bestowed upon it by producing spikes 4, 5, and even 6 feet in length, those of the vestita section bringing also spikes of from 3 to 4 feet. The later flowering varieties, *Turnerii* and *nivalis*, will not be quite so forward as those just mentioned; they will, however, come on, and succeed the others, and be very welcome during February and March. *C. Turnerii* is certainly a gem of a flower, the white being so pure. A little manure-water should still be given to the whole of them; being free rooting plants they enjoy a liberal treatment at the roots, at the same time they should now have scarcely any shade at all, though the leaves must not be scorched. By this means they become strong and ripened, and in the dull months are objects of grandeur and intense gratification. The varieties of *Veitchii* vary considerably, some having flowers of a much darker colour than others. When the deep rose form is obtained, it should be carefully preserved and increased by divisions in the early spring, so that in due time the whole stock may be of the better sort. *Acerides*, *Vandas*, and *Saccolabiums* are still growing vigorously, and must have a good supply of water, that the stout fleshy roots may quickly find the desired support. Syringing overhead must now be discontinued, water lodging in the axils of leaves often causing them either to become spotted or fall off altogether. *Angraecums*, too, are still in free growth; these are much disposed when the roots enter the moss to start away into many lateral divisions, thus increasing the means of obtaining its share of moisture. They must not, at any time, be kept very long without water. *A. eburneum* will now be showing its flower-spikes, and will, in a very short time, be succeeded by the magnificent *sesquipedale*. *W. Swan, Fallowfield*.

FLOWER GARDEN, ETC.

After the heavy rains we have lately experienced, the great attraction of the flower garden has faded for a time, but a few days of sunshine would again renew the appearance greatly. Have the *Pelargoniums* picked over, and all the decayed flowers and foliage removed; some of the sorts have suffered considerably. Several of the plants in the beds and borders have rather outgrown their proper limit. These must be stopped, or the shoots thinned in a careful manner, so as not to mar the general appearance, for so much depends upon all: the plants being well-balanced that discrimination is required to execute the work with neatness. The grass will also require more attention now to keep it solid and clean, as the worms are getting troublesome and making mowing more difficult. Push forward the propagating of *Pelargoniums* and all other bedding plants, with the exception of shrubby *Calceolarias*, which are better delayed until next month. *Roses* may still be budded. Those that were done early in the season had better be looked over. See that the binding material is not cutting into the wood. Any that have not taken may be done again. The buds are now in good condition, and the season not yet too far advanced for the operation. Where there are many trees the leaves will soon begin to give additional labour and make the place littery; have them swept up as often as may be needful. *T. Blair, Shrubland Park*.

FRUIT HOUSES.

STRAWBERRIES IN POTS.—If former directions have been carried out in respect to these plants they will now be making rapid growth, and will soon have filled the pots with roots. With us early potted plants of *Black Prince* in 4-inch pots, and others also, are already in this condition. At this stage of growth weak manure-water will be highly beneficial to all the plants, but particularly so to those in small pots; and it should be given at least once every week if water be required. Watering, in comparison with some seasons, has been reduced to a minimum state this year by reason of frequent rainfalls; under such circumstances see that no imperfection in the drainage exists, as, if this be the case, and it be not remedied at once, it will speedily prove fatal to the health of the plant. As the plants increase in size give them more room to perfectly develop themselves, and keep them free from runners and weeds. This remark will likewise apply to those plants which are planted out in open quarters. The present season is a good time to prick out runners beside the margin of walks and other such suitable places, for the sole purpose of producing stock for the subsequent year: this method is highly commendable. Where plants of *Keens' Seedling* and similar early fruiterers were planted out early last spring after being forced, there will probably

in most cases be some which are showing fruit now; if this crop be valued provide the means to keep the fruit free from grit at once, and if any hand-lights be at liberty these might be placed over them and be advantageous. *Geo. Thos. Miles, Wycombe Abbey*.

HARDY FRUIT GARDEN.

It is only those who have charge of the fruit department of a garden that can have any idea of the vexation and annoyance wasps cause, and voracious as they are, spoil much more than they devour, for no sooner is the skin of a Peach or Plum broken through than it begins to decay, and is soon totally unfit for use. Unfortunately there are not many of either of these, or, indeed, anything else except Figs and a few Apples and Pears, for them to attack this season, but that is the more reason why increased vigilance should be exercised to preserve what little there is, and as this cannot be done by the ordinary means of protection (the use of hexagon netting and such-like), the only thing is to seek out their nests and destroy them. This is most readily effected by pouring into the hole some carbolic acid, turps, or tar, and then to block it up tight, so as to prevent any fresh air getting in, when they will soon be suffocated; but this should be done at night when they are all home, otherwise those out will continue their depredations. The small quantity of fruit at stake may deter some from taking much trouble in the matter, but it should be borne in mind that every nest destroyed now does away with a great many queens that would most likely winter securely and form fresh colonies next year. These may likewise be trapped by banging up bottles containing a mixture of coarse sugar and stale beer, which decoys them in and seals their fate. Next to blackbirds, the most destructive to the Fig crop are the small tom-tits and a migratory bird about the size of a hedge-sparrow, that does much mischief unless very fine nets are used to keep them out, and these should be put on at once, and made secure before any damage is done to the fruit, which are now fast ripening. Early Pears, such as *Williams' Bon Chrétien* and others that are now approaching maturity, should be frequently looked over, so as to gather the most advanced, by which means a longer succession may be kept up, besides having all of improved quality, as when they become over-ripe from laying they get mealy and lose much of their flavour. The same remarks apply to *Kerry Pippin* and other short keeping Apples that soon deteriorate after they are fit for use, and should therefore be watched to catch them at the right time, and when this is the case any one at all acquainted with fruit will have no difficulty in judging. The late heavy rains have caused fresh shoots to start on Peas, Plums and most wall trees, which should be kept closely stopped back or laid in according to their respective kinds. Owing to the late growth Peaches and Nectarines made, much attention will be requisite in order to get the young wood properly ripened, in which process they may be greatly assisted by thinning out all superfluous shoots, and nailing or tying in others quite close to the wall so as to afford them the full benefit of any extra heat absorbed by the bricks or that may be reflected from them. Now that summer fruiting Raspberries have done bearing, the old canes should at once be cut away to let in plenty of light and air amongst those formed during the present summer, that they may become well hardened before winter sets in. The present season has been eminently favourable for the growth of Strawberry plants, all of which are looking in a most vigorous healthy condition, and as they are now forming their flower-buds there is not likely to be any lack of this most useful and wholesome fruit next year. It is the practice with some to clear away the greater part of the foliage when trimming the beds, but this is a very barbarous proceeding and has a decidedly weakening effect on the plants by checking root-action, besides which, the leaves are necessary in developing and maturing the crowns. Every leaf therefore that is at all green should be carefully preserved and allowed to remain as a natural winter protection, in addition to a coat of half rotten manure to act as a mulching, for the purpose of enriching the ground and to prevent frost penetrating sufficiently deep to have an injurious effect. Although Strawberries should not be trimmed up in the severe manner they usually are, or have the soil between them disturbed by being dug or forked up, all runners that are not required for forming fresh plantations should be at once removed and the ground cleaned by giving it a shallow hoeing with a Dutch hoe. *J. Sheppard, Woolverstone Park*.

KING RENÉ AND FLOWERS.—The last of the troubadours, as he has also been called, introduced Carnations into Anjou and Poitou, for which all lovers of flowers should be grateful. Nowhere do you see these glorious flowers in such perfection as in this part of France: the most delicate perfumes, the richest colours mark it the crowning glory of flower-beds. "*A Year in Western France*," by *M. Bethune-Edwards*.

THE
Gardeners' Chronicle.

SATURDAY, SEPTEMBER 8, 1877.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, Sept. 10	— Sale of Dutch Bulbs at Stevens' Rooms, Autumn Show.
	Royal Caledonian Horticultural Society's Newcastle-on-Tyne Botanical and Horticultural Society's Autumn Show (two days).
WEDNESDAY, Sept. 12	— Brighton and Sussex Horticultural Society's Autumn Show (two days).
	— Sale of Dutch Bulbs at Stevens' Rooms.
THURSDAY, Sept. 13	— Alexandra Palace Fruit Show (three days).
SATURDAY, Sept. 15	— Sale of Dutch Bulbs at Stevens' Rooms.

WE learn by a telegram, received as these sheets are passing through the press, from our correspondent at CARLISLE, that the prospects of the INTERNATIONAL EXHIBITION of Fruits and Flowers which opened in that city on the 6th inst. are sadly marred by extremely unpropitious weather. Up to Wednesday evening the promise of a successful exhibition was all that the most energetic of committee-men could desire, but, as BURNS has well said, "The best-laid schemes of mice and men gang aft aglee;" and so it has proved in this case. The weather was, comparatively speaking, fine for the last week, but on Thursday morning it commenced to rain before daybreak, and rained an incessant downpour up to the time our telegram was despatched, thoroughly damping the spirits of all concerned in the undertaking. The show ground is one of the best that could possibly have been selected had the weather only been fine. As it was, the visitors had to wade ankle-deep in slush or water, and there was no exception—show tents and outside promenades were all alike a perfect Slough of Despond. The Saucerias, a piece of ground belonging to the Corporation, and on which the show was held, is, without exception, one of the prettiest places for holding a show of this kind that could be met with. It is near the centre of the town, not far from the railway, generally convenient of access, and surrounded with pleasant scenery; but the weather has upset everybody's calculations. In another column will be found the full details of the show, but we may here say in general terms that, as compared with similar exhibitions held in the North during the last few years, the show is only of second-rate importance. The preparations that are made were on the most liberal scale. There is enough and to spare of everything but the essentials to a successful show—plants and fruits. As regards the plants we are bound to say that the display on the whole is good, but when we come to the fruit department—really the life and soul of an autumn show—we are obliged to admit that it is a long way beneath the standard. The arrangements made by the committee are all that could have been desired, and had everything been shown that was entered, and the weather been fine, it must have been an unqualified success. As the exhibition does not close until Saturday, it is to be hoped that the efforts of the committee may still find their justly merited reward.

The luncheon was held on Thursday in the grounds, Lord MUNCASTER in the chair, supported by the Mayor of Carlisle, Sir WILFRID LAWSON, the Earl of LONSDALE, and a large number of the gentry of the neighbourhood.

A CORRESPONDENT has lately forwarded us a most interesting WAIF FROM OVER THE SEA, in the shape of a young plant of CÆSALPINIA or Guilandina Bonduc, raised from a seed washed on shore in August, 1876, in Festrol Bay, on the north coast of Cornwall. It was sown in April of the present year, and has germinated well. The two species of Guilandina are trailing leguminous plants, found in nearly

every tropical country, particularly on the seashore, their extensive distribution being caused by the transport of the seeds (which have an exceedingly hard impervious shell), from one country to another by means of oceanic currents. In the present instance the seeds must have crossed the Atlantic probably from the West Indies. How long they were on the journey who shall tell? The average rate of Atlantic currents is given at 33 miles a day, some running at the rate of 60 miles. In any case the seeds must, in all probability, have been a considerable time on the journey, and afford an instance of resistance to the injurious action of seawater. In Mr. DARWIN'S experiments, out of eighty-seven kinds of seeds sixty-four germinated after an immersion of twenty-eight days in salt water, and a few survived after an immersion of 137 days. Ripe Hazel-nuts sank immediately, but when dried they floated for ninety days, and afterwards germinated. Mr. DARWIN concludes, from his own experiments and those of M. MARTENS, that the seeds of about 10 per cent. of the plants of a flora could, after having been dried, be floated across a space of sea 900 miles in width and then germinate.

Referring to this very plant (Guilandina), amongst others, ROBERT BROWN remarks "that the two conditions of development and protection of the embryo co-exist in so remarkable a degree that I have no doubt the seeds of those plants would retain their vitality for a great length of time, either in the currents of the ocean or in the digestive organs of birds." The eminent botanist adds in a note that—"Sir JOSEPH BANKS informs us that he received some years ago the drawing of a plant, which his correspondent assured him was raised from a seed found on the west coast of Ireland; and that the plant was indisputably Guilandina Bonduc; Linnæus also seems to have been acquainted with other instances of germination having taken place in seeds thrown on shore on the coast of Norway. Other instances of like nature are cited by Sir HANS SLOANE. These cases afford interesting proofs of the manner in which plants migrate and under favourable circumstances occupy new territory, though it is clear that the climatal conditions of North Cornwall are not such as would be suitable to the requirements of such a plant as Guilandina Bonduc. Let us hope the Colorado beetle will find these shores equally inhospitable. In any case our thanks are due to the correspondent who sowed the seed in question, and has thus afforded evidence that such seeds, wafted from a tropical country, may yet retain their vitality—a point which has been questioned.

— OUR figure (fig. 61, p. 305) represents a flowering plant of LILIUM CORDIFOLIUM, which has flowered at Kew during the present year, and also with M. KRELAGE, of Haarlem. The flowers are whitish on the exterior, marked with purple on the interior, especially towards the base of the two inner segments. These coloured spots evidently serve as signposts to insects, which in visiting the flower for the honey must necessarily pass between the spots in question, and the anthers, which are curved downwards so that the insects would brush out the pollen therefrom. This is one of the innumerable illustrations of adaptation and design offered to the intelligent plant lover. It was at one time supposed that the Japanese L. cordifolium was the same as, or a variety of, L. giganteum of Nepal. From our figure, however, it will be seen that the differences between this species and L. giganteum are well marked. The leaves are more distinctly cordate than in L. giganteum, the flowers less numerous and more crowded, the bracts much broader, the flower-buds erect, not pendulous, the flowers of a different shape, more widely spreading at the limb, the segments of a different form, and the curvature and relative length of the stamens quite different. We do not know if these are general characteristics, as we speak only from the specimen before us. It would seem that botanists have been misled by the

examination of dried specimens only. Much allowance must also be made for individual variation, as is apparent from the letters which have appeared in our columns lately from Messrs. KRELAGE, MAX LEICHTLIN, and NOBLE.

— The COLORADO POTATO BEETLE has become simultaneously the special subject of an Act of Parliament and the theme of a music hall comic song. Looking at what has taken place in one branch of our Legislature recently, it would be difficult to say which of the two was the greater honour or the greatest absurdity. The other day, in the Richmond Police Court, the Act and its provisions became the theme of general laughter and ridicule, the absurd red-tapeism of the Act assisting to expose the greater absurdity of the great beetle scare.

— It is a somewhat remarkable fact that the VINE MILDEW seldom displays itself on Vines grown in the open air. Does this arise from the hardier nature of these exposed Vines, or does it follow because they are grown in a pure free air? We have lately seen in rural districts large quantities of Grapes produced on cottages, the culture being of the rudest, and the roots finding food amidst those of trees, hedgerows, flowers, and, indeed, where and how they can, yet not a trace of the mildew could be found. Of Vines so grown have been found such tender kinds as Muscat of Alexandria and Black Hamburgh—varieties that take it freely under glass, and yet grown in the open air they are as clean as could be desired. The best sorts for cottage culture are Royal Muscadine and Sweetwater, as these will ripen fruit well in any ordinary summer. The former and the Esperione are the best for wine-making, and for this purpose need not attain to perfect ripeness. Nice ripe imported Grapes, both black and white, have during the past week been selling in the streets of London at 6½ per lb. What will our Grape-growers say to this?

— The following particulars with reference to sales recently effected by Messrs. PROTHEROE & MORRIS may be of interest to our readers, as showing the value of land:—The Park Estate, Leytonstone, consisting of 24 acres of freehold land, family mansion, out-buildings, &c., realised £16,800; the Grove Estate, of Leytonstone, comprising 6 acres of freehold building land and house, £6350; 8 acres of freehold land, part of the estate known as The Cedars, Leytonstone, £7000; the Garston Vineyard, Liverpool, consisting of about 6 acres of freehold land, thirty greenhouses, dwelling-house, &c., £11,500; Broomfield Hall, Herne Bay, 12 acres of freehold land, dwelling-house and out-buildings, £3750; result of sale of land (fifty plots) in the Mornington Grove and High Roads, Leytonstone, £5500—the total amount of these and other minor sales not here detailed being £53,900.

— It is very necessary to look at things from all possible points of view. Perhaps if the Richmond agitators who seek to overthrow the walls of the ROYAL GARDENS, KEW, by "shouting with a great shout," were to look on the other side of the wall, they would not be so desirous to level it, at least those portions which now conceal from view sheds and out-houses, coke stores and rubbish-heaps, turf stacks and rearing places for ornamental waterfowl, cloak-rooms and furnaces, and all the miscellaneous offices which are now concealed between the shrubberies and the wall bounding the Richmond Road. Again, it would be most undesirable to remove the wall where it skirts the herbaceous ground. Making allowances, then, for those portions of the wall which are absolutely necessary for the purposes of the protection of the property, shelter to the plants, or concealment of unsightly objects, there does not remain much for the Richmond folk to spend their breath on.

— The annual FUNGUS MEETING of THE WOOLHOPE CLUB is appointed for the week beginning Monday, October 1. Messrs. Berkeley, Broome, Cooke, Houghton, Lees, Percival, Phillips, Plowright, Renny, Smith, Vize, and others have, we believe, promised to take part in the proceedings. Tillington, Wormsley Grange, Holme Lacy, Downton, Dinmore, and Moor Court will be visited in turns in search of edible and poisonous fungi, and such species as possess botanical interest. Amongst the papers to be read at the evening meetings we may

FIG. 61.—LILIUM CORDIFOLIUM.

mention two by Dr. COOKE—one termed "What is the Use of Fungus Hunting?" the other on "The Structure and Classification of the Myxogastres." Mr. WORTHINGTON SMITH will also read some notes on "A Fossil Fungus (Phythium) of the Paleozoic Epoch, with zoospores *in situ*," and exhibit the actual specimens, with drawings.

— Mr. GREENFIELD, The Priory Garden, Warwick, informs us that the subscription is closed for Mr. GARDENER's testimonial, and that Mr. GARDENER begs to tender his best thanks to the numerous friends who kindly subscribed.

— The Report of the Fruit Grower's Association of the Province of Ontario, 1876, is largely occupied with a detailed report of the fine exhibition of fruit made under the Society's auspices at the recent Centennial Exhibition in Philadelphia. To it is appended the report of the Entomological Society of Ontario.

— Mr. MEEHAN sums up his review of Mr. DARWIN's work on CROSS AND SELF FERTILISATION OF PLANTS by stating his opinion that "there is infinitely more self-fertilisation among flowers than advocates of insect agency have of late years been contending for; that cross-fertilisation, as developed to advantage by Mr. DARWIN's artificial experiments, is an almost impossible occurrence in most cases in Nature; and where it must and does occur the fact is capable of a very different explanation."

— The second part of the recently resuscitated *Journal of the Royal Horticultural Society* has just been issued in the form of a single sheet containing the report of the Pelargonium grown at Chiswick in 1876, and the commencement of a paper by Mr. WOLLASTON on the best means of preserving from extirpation some of the aboriginal plants of St. Helena, which is very tantalising, inasmuch as only a page or so is given—"to be continued." The author, in view of the difficulty of getting seeds to germinate in this country, proposes to introduce them by means of rooted cuttings.

— In the report on the SINGAPORE BOTANIC GARDEN for 1876 it is mentioned that "a little insect, *Baridius aterrimus*, has proved very destructive to the Orchids by depositing its eggs in the axils of the youngest leaves; the young insects, or larvae, when hatched, soon destroy the whole centre of the plant. *Phalaenopsis*, *Saccolabium*, *Aerides* and *Vanda* are the genera most infested with them, and all the attempts made to stop its ravages have hitherto proved futile.

— We have received the programme of the EXHIBITIONS OF FLOWERS AND FRUIT to be held at DRESDEN in 1878 in honour of the jubilee of the Flora Society of Botany and Horticulture, established in that city in 1828 by Professor REICHENBACH the elder. The first exhibition will be held from March 21 to 25, and will include Camellias, Azaleas, stove plants, forced Hyacinths, &c. The second exhibition will take place from May 16 to 20, and will comprise Azaleas and Rhododendrons; the third, from July 25 to 29, is a general summer show; and the fourth, from October 3 to 7, will be devoted mainly to fruit and vegetables. Following the example set at South Kensington this season, there will also be exhibitions of market plants. Prizes will be given. Communications should be addressed to the secretary of the Floral Society, Brückenstrasse No. 6, Dresden.

— The usual monthly meeting of the SCOTTISH HORTICULTURAL ASSOCIATION was held at 5, St. Andrew Square, Edinburgh, on the evening of the 4th inst. Mr. DUNN, Dalkeith Park Gardens, occupied the chair. Fifteen gentlemen were elected members, while other ten were proposed and seconded for election at next meeting. Mr. KERR, of Messrs. DOWNIE & LAIRD, nurserymen, read an interesting paper on "The Rose," in which he pointed out its antiquity, the appreciation in which it was held by the ancients, described the most essential parts of its culture, and the conditions requisite to its successful growth. He detailed the mode of propagating by cuttings, of collecting stocks, of pruning, budding, &c. He referred to an eminent American author, Mr. SCOTT, Philadelphia, who recommended

budding of the Maréchal Niel Rose on the Banksian, a natural climbing Rose, which is more vigorous, and shoots more suitable than any other; but Mr. KERR, as well as the Chairman, Mr. DOWNIE, Mr. GRAY, Mavisbank Gardens, and others, who afterwards spoke, were of opinion that Roses did generally well on their own roots, if they were only properly attended to, and people had the patience to wait on them until they grew into fair-sized plants. A hearty vote of thanks was awarded to Mr. KERR for his admirable paper. The Chairman intimated that provision had been made for the reading of papers for the next three months; Mr. ROBERT LINDSAY, of the Botanical Gardens, having agreed to read a paper at next meeting on "Root Propagation." Mr. ROBERTSON, Seacot Gardens, Leith, exhibited a stand of two dozen very superior seedling Carnations of his own raising, for which he received the high commendation of the meeting. A vote of thanks was also awarded to Mr. HUNTER, Newhailes Gardens, for a pan of his new *Tropaeolum Hunteri*, which was shown in excellent condition, and proves to be a decided acquisition in the flower garden.

— We are informed that Mr. D. LAMONT, late gardener to Lord CHESHAM, has been appointed gardener to Captain HAWKESLEY, Ranelagh House, Fulham, a distinguished fruit and plant grower.

— At the CONGRESS organised by the BOTANICAL and HORTICULTURAL SOCIETIES OF FRANCE, to open on the 16th of August, 1878, and continue for six days, it is proposed that the following subjects should be treated:—

BOTANY.

Scientific Department.—1. Physiology of the root. 2. Gymnospermy—present state of our knowledge concerning. 3. Fecundation of Hymenomyces and Ascomycetes.

Practical Department.—1. Organisation of botanical and physiological laboratories; description of the best ordered establishments and plans for the organisation of a model laboratory. 2. Comparison of the mode of organisation of the large botanical collections of Europe; conditions to be fulfilled in such collections; Herbaria, collections of woods, fruits, fossil plants, &c. 3. Different modes of arrangement, labelling, &c., in various botanic gardens.

If possible, plans should be exhibited in connection with these communications.

HORTICULTURE.

Scientific Department.—1. Influence of the age of the seed on the offspring. 2. Circumstances determining the production of double flowers. 3. Production and fixation of varieties. 4. VAN MONS' theory of the production of varieties, is it well founded?

Practical Department.—1. Hortus Europæus, continuation of the discussion of. 2. Means of cultivating plants in botanical gardens which at present are rebellious to cultivation. 3. Indication of woody plants remarkable for their age, habit, form, or other peculiarities. 4. Artificial manures applied to plants cultivated in the open air or under glass.

Other subjects may be treated of, and a list of the subjects which botanists or horticulturists may desire to bring under the notice of the congress will be hereafter published. Those botanists and horticulturists who may not be able to be present, but who send papers, are requested to furnish abstracts thereof, to be read at the meetings. An exhibition of herbaria, and all materials for the preparation and conservation of plants, and for the study of botany generally, plans of laboratories, museums, botanic gardens, books, plates and drawings relating to the study, or to the mode of teaching botany and horticulture, will be held at the meeting-place of the congress, 84, Rue de Grenelle St. Germain. Directors of museums and botanists are earnestly desired to contribute specimens, so as to render this exhibition as complete and instructive as possible. The President is M. LAVALLÉE, the Secretary M. MER, and among the names of the committee we find those of MM. Baillon, Bureau, Chatin, Corne, Cosson, Duchartre, Duvierv, Hardy, Jamin, Ketelee, Malet, Moras, Briot, Planchon, Prillieux, Ramon, Roze, Verlot, and Vilmorin.

— In this all but fruitless season it would be very desirable if our correspondents would kindly name those sorts of Apples and Pears which are bearing a crop. In some places we hear of Small's Admirable bearing a good crop.

— The "RIPENING OF THE WOOD," a process familiar enough to gardeners as taking place in hot autumns, receives some illustration from some experiments lately published by M. VESQUE of Paris, in the *Annales des Sciences Naturelles*. We are all familiar with the maturing process that goes on in this hot weather, a process so characteristic of the month of August in these latitudes that the French word for it is *aoûté*, from *août*, August. It is, however, questionable whether we have any but a vague and general idea of what the process really consists in. An excessive amount of evaporation of fluid from the surface of the leaves as contrasted with the quantity absorbed by the roots, a consequent withering of the leaves, and a general drying up of the tissues of the plant, with consequent chemical changes, resulting partly in a hardening of the tissues, partly in an alteration of their several contents, so as to enable them to be stored up as reserve stores for future use under altered circumstances—this is, roughly speaking, all we know about the consolidating maturing process commonly known as ripening of the wood. M. VESQUE's experiments were devised with the object of determining the quantity of water absorbed when the amount of transpiration was varied. Does absorption increase in the same proportion as transpiration? What is the effect of changes of temperature? It is not the extent of surface merely but the age of the leaf which must be taken into account, younger leaves, as a rule, transpiring more freely than older ones. As to the effect of temperature M. VESQUE's experiments show that every sudden rise of temperature of the air diminishes the amount of water absorbed by the roots. A lowering of the temperature promotes the absorption of water by the roots. When a plant is removed from darkness to diffused light the amount of transpiration does not immediately increase, and inversely, when a plant is withdrawn from the action of the light the amount of evaporation is not immediately diminished. The effects of changes of temperature may be explained by the expansion or condensation of gases in the interior of the plant.

— We are informed that the date of the ROYAL HORTICULTURAL SOCIETY'S PROVINCIAL SHOW AT PRESTON in 1878 will be from Tuesday, July 9, until Saturday, July 13, both days inclusive, and that a committee has been appointed to draw up a schedule. The show is to be held on a beautiful and well adapted piece of land, some 35 acres in extent, belonging to, and a portion of, the Preston Nursery and Pleasure Garden Company's grounds, on the outskirts of the town, easy of access, and in every way calculated to give confidence of a successful gathering. Those who take an interest in, and are acquainted with horticultural matters are well aware that this country, so engrossed in manufacturing and mercantile pursuits, has always cherished gardening to an extent not surpassed by any other portion of the kingdom; the numerous and splendid collections of plants existing in the surrounding district at once furnish the material for a grand display, and the spirit always shown in horticultural affairs in this division of the kingdom is sufficient to warrant our expecting its being one of the most satisfactory visits the Society has made to the provinces. We hear that the local authorities are taking steps that will leave nothing undone to secure a favourable issue, calculated alike to reflect credit on the town and district, and give an increased impetus to good gardening, in the way these summer shows of the Society have so far done in the different localities they have been held in.

— In the last issued part of the *Journal* of the Linnean Society Mr. LYNCH calls attention to some very curious cases of Cladotopsis or DISARTICULATION OF THE BRANCHES. This process, as is well known, occurs in *Taxodium distichum*, in *Thuja*, and sometimes in Oaks and Elms. The process is quite analogous to that by which the ripe fruit—say a Pear—is separated from the stalk bearing it, and by which the fall of the leaf is brought about. *Vitis macropus*, a curious fleshy-stemmed Vine, thus year by year detaches a portion of the season's growth, a small section only being permanent. Mr. LYNCH gives other instances of detachment of the branches in *Castilleja*, in *Antiaris*, and in *Phyllanthus*.

— Among BEETS the EGYPTIAN TURNIP-ROOTED variety may be recommended as very early and of good flavour. We lately saw some samples

of it at Hardwicke, which fully bore out Mr. Fish's commendation.

The last part to hand of the *Wiener Gartenfreund* contains, in the form of an appendix, a history of the Proceedings of the Horticultural Society of Vienna during the years 1864 to 1877, preceded by a short sketch of the progress and work of the society from the time of its foundation in 1827 up to 1864. The occasion of this was the celebration of the fiftieth anniversary of the society. Like our own society it has enjoyed periods of prosperity interrupted by the most gloomy and hopeless reverses. More than once it has been apparently on the eve of dissolution, when a few energetic and enthusiastic men have by almost unceasing labour succeeded in resuscitating it, liquidating outstanding debts, and raising it to its proper level. A part of the self-imposed functions of this society is a school of gardening, but hitherto want of funds has hindered the perfect realisation of the scheme.

ON THE SEDUMS OF THE RUPESTRE GROUP.

THERE are no succulent plants more common in gardens than the yellow-flowered perennial Sedums, with narrow, turgid, pointed leaves, and none about the naming of which there is more confusion. As I have this summer taken some pains to ascertain the right application of the various names which have been used, and the relationship to one another of the plants which they denominate, I should like to be allowed to explain in your columns my conclusions in detail. I have named all the specimens at Kew in accordance with the nomenclature here followed, and any one who is interested in the matter may easily study for themselves on the rockeries in Kew Gardens authenticated specimens of all the leading forms here described.

I admit in the group six fully distinct species, five European, for which, according to my interpretation of the recognised rules of botanical nomenclature, the proper names to be used are *S. reflexum*, *rupestre*, *ochroleucum*, *anopetalum*, and *amplexicaule*, and one American species, *S. stenopetalum*. In the *Hortus Cliffortianus* (1737) Linnæus represented this group under two varieties, one of which is *S. reflexum*, and the other a plant gathered by Dillenius at Cheddar, which is figured and described by the latter in *Hortus Elthamensis*, p. 243, tab. 256, fig. 333, under the name of *Sedum rupestre repens foliis compressis*, and is identical with what was afterwards called *S. pruinatum* by Brotero, and *S. elegans* by Lejeune. These two are perfectly distinct species, but in his *Species Plantarum*, in which the foundations of our present system of nomenclature of genera and species are laid, Linnæus combined the two together as a single species, for which he adopted the Dillenian name of *rupestre*. In his *Herbarium* the type specimen is neither *S. reflexum* nor the Dillenian *rupestre*, but the very different South European *S. amplexicaule*. In his later writings (*Flora Suecica* and *Species Plantarum*, 2d edition) Linnæus defines two species, which he calls *rupestre* and *reflexum*, but he does not seem to have understood the plants clearly, and the wild form which in the *Flora Suecica* he calls *rupestre* is not the Dillenian *rupestre*, but a variety of *reflexum*. Through this has arisen much confusion in the application of the name of *rupestre* by later writers, but although in doing this I am at variance with several of the most highly esteemed florists written by Continental authors, it seems to me that the proper thing to do under these circumstances is to limit the name *rupestre*, as Hudson, Smith, and English writers have done, to the original Dillenian plant. The only other alternative would be to let it fall out of use altogether. This premised, I proceed next to characterise the six species and their varieties.

Key to the Species.

- Leaves without any wing in the lower part.
 - Leaves distinctly compressed on both face and back.
 - Leaves oblanceolate or linear-lanceolate.
 - Petals lanceolate, pale yellow. 1. *S. OCHROLEUCUM*.
 - Petals linear, bright yellow. 2. *S. STENOPETALUM*.
 - Leaves linear. 3. *S. RUPESTRE*.
 - Leaves subulate.
 - Petals 3-4 times as long as the deltoid sepals. 4. *S. REFLEXUM*.
 - Petals barely twice as long as the lanceolate sepals. 5. *S. ANOPETALUM*.
 - Leaves with a broad chartaceous wing down the lower part. 6. *S. AMPLEXICAULE*.

1. *S. ochroleucum*, Chaix, in Vill. Fl. Delph., vol. i.,

p. 325 (1786), vol. iii., p. 676; Smith, Prodr. Fl. Græc., p. 312; *Semperivium sidiforme*, Jacq. Hort. Vind. i., t. 81 (1770); *Sedum altissimum*, Poir. Encyc., vol. iv., p. 634 (1796); Reich, Ic. Crit., t. 285; D.C., Plantæ Grasses, t. 40; *S. lasitimum*, Brotero, Phil., t. 178; *S. fruticosum*, Brot. Fl. Lusit., vol. iii., p. 206 (1804); *S. rufescens*, Tenore, Fl. Nap., vol. i., p. 243, tab. 41; *S. dioicum*, Donn, Cat., edit. iii. (1804); *S. altum*, Clarke; *S. Jacquinii*, Haworth.—Stems $\frac{1}{2}$ — $\frac{3}{4}$ inch thick, trailing in the lower part, the leafy shoots 3-4 inches long, bearing oblong tufts of leaves for 1 or 2 inches, leafless below them. Leaves arranged in spires of six, a light rather glaucous green when young, when old tinged with claret-red, oblanceolate, $\frac{3}{4}$ —1 inch long, $\frac{1}{4}$ — $\frac{3}{8}$ inch broad, acute, both the back and face nearly flat. Flowering-stem stouter than in the other species, 1 foot or more long, bearing 30-40 leaves, which are stouter and more ovate than those of the sterile rosettes, the lower 1 inch, the upper $\frac{1}{2}$ inch long, all erect. Cymes dense, 1 $\frac{1}{2}$ —3 inches in diameter, consisting of three or four dichotomously forked reflexed branches, the lower flowers only furnished with very short pedicels. Calyx $\frac{1}{2}$ inch in diameter, $\frac{1}{2}$ inch long; teeth deltoid, twice as long as the tube. Expanded corolla above $\frac{1}{2}$ inch across; petals lanceolate, deeply channelled, $\frac{1}{2}$ inch long, always pale yellow, spreading between the sepals. Stamens little shorter than the petals; filaments linear, pale yellow, slightly pubescent; anthers oblong, orange-yellow. Carpels greenish, erect, $\frac{1}{2}$ inch long; style half as long as the ovary. Parts of the flower usually 6-8.

This is spread through the South of Europe, from Portugal to Palestine and Asia Minor. It may easily be distinguished from any of the other Old World kinds by its flat oblanceolate leaves. As will be seen by the synonymy, it has received eight different names under *Sedum*, the oldest being that which I have used. *Sedum niceense* of Allioni, Fl. Ped., vol. ii., p. 122, tab. 90, fig. 1, which is sometimes referred here, goes back to 1785, but the figure looks as if it was made up of a cyme of *S. amplexicaule* put on the top of a flower-stem of this species; and I therefore reject it. The old figure of Jacquin is a very good one. The only variety worth mentioning with which I am acquainted is *S. cœrulescens*, Haworth, in Phil. Mag., 1825, p. 174, which is not more than half as tall as the type, with very glaucous leaves.

2. *S. stenopetalum*, Pursh, Fl. Amer. Sept., vol. i., p. 324; Hook. Fl. Ber. Am., vol. i., p. 223; Torrey and Gray, Fl. vol. i., p. 560; S. Wats. Bot. 30 Parall., p. 101; *S. lanceolatum*, Torrey, in Ann. Lyc. New York, vol. ii., p. 205; *S. subcylindricum*, Haw. in Phil. Mag. 1841, p. 414.—Densely tufted. Barren shoots not more than 1-1 $\frac{1}{2}$ inch long, bearing in the upper half dense rosettes of leaves, which are about $\frac{1}{2}$ inch in diameter. Leaves linear-lanceolate, acute, under $\frac{1}{2}$ inch long, $\frac{1}{16}$ inch broad, $\frac{1}{16}$ inch thick, turgid on both faces, glaucous. Erect flowering-stems under $\frac{1}{2}$ foot high, clothed with dense erect small narrow lanceolate leaves. Cymes dense, reaching a diameter of 3-4 inches, bearing as many as 4-5 dichotomous forks, only the lowest flowers furnished with very short pedicels. Calyx $\frac{1}{2}$ inch long; teeth deltoid, twice as long as the tube. Petals 5-6, bright yellow, linear, $\frac{1}{4}$ — $\frac{3}{8}$ inch long, spreading widely when expanded. Stamens nearly as long as the petals. Carpels as long as the filaments, narrowed gradually into a long slender style half as long as the ovary.

A native of the Rocky Mountains in Oregon, Upper Missouri, and Nevada, ascending to a height above sea level of 5000-9000 feet. It is most like *S. reflexum*, from which it is easily distinguished by its flattened leaves. It is rare in English gardens, and our Kew specimen has not yet flowered.

3. *S. rupestre*, Linn. Sp. Plant., both editions in part; Huds. Fl. Angl. 195, as regards all the English synonyms and localities; Smith, Engl. Bot., t. 170; Engl. Flora, vol. ii., p. 321; Symb. Eagl. Bot. edit. iii., vol. iv., p. 58; *S. rupestre repens foliis compressis*, Dillen. Hort. Elth., p. 343, tab. 256, fig. 333; *S. minus of rupe S. Vincentii*, Kay, Synops., edit. ii., p. 152; *S. pruinatum*, Link. in Brot. Fl. Lusit., vol. ii., p. 209 (1801); Willk. and Lange, Prodr., vol. iii., p. 137; *S. elegans*, Lejeune, Fl. Spa., vol. i., p. 205 (1811); Gren. and Godr. Fl. France, vol. i., p. 626; Koch, Syn. Germ., edit. ii., p. 233.—Densely tufted. Dark red-brown stems under $\frac{1}{2}$ in. diameter, trailing at the base, bearing copious barren leafy branches 2-4 inches long, at the top of which the ascending leaves form a dense obconical rosette $\frac{1}{2}$ to 1 inch in diameter, the lower part of these branches clothed with ascending withered leaves. Outside leaves of the rosette linear, $\frac{1}{2}$ inch long, $\frac{1}{16}$ inch broad at the middle, not more than $\frac{1}{16}$ line thick, pale glaucous green, only slightly turgid on both faces, distinctly cuspidate. Flowering stem about 1 foot high, densely clothed with erect leaves shorter than those

of the rosettes, the lowest $\frac{1}{2}$ inch long. Cymes dense, 1-2 inches broad, consisting of about four dichotomously forked branches; lower flowers furnished with pedicels $\frac{1}{16}$ — $\frac{1}{8}$ inch long, upper sessile. Calyx under $\frac{1}{2}$ inch long; teeth oblong-lanceolate, twice as long as the tube. Petals bright yellow, lanceolate, $\frac{1}{2}$ inch long, spreading widely when fully expanded. Stamens bright yellow, very little shorter than the petals. Carpels as long as the filaments, the slender permanently erect ovary narrowed into a style half as long as itself. Parts of the flower in fives to sevens.

Widely spread through France, Spain, and Portugal. It grows wild also in Belgium, and in England in the Cheddar gorge, and on St. Vincent's Rocks, near Bristol. We have specimens at Kew gathered at Lochnaiv, in Galloway, by Professor Balfour, but I am not aware whether it be truly native in Scotland. It seems to be quite absent from Italy, Switzerland, Germany, Scandinavia, and further east. The *English Botany* figure, which is rather too robust in habit and thick in the stem-leaves to give a good idea of the species as contrasted with reflexum, was drawn from a specimen sent to Sir J. E. Smith, by my relative Edward Robson, from walls at Darlington. The plant drawn by Redouté for De Candolle in the *Plantæ Grasses* (tab. 115) as *rupestre* is simply typical reflexum. Though this species is so common and well known a thoroughly satisfactory plate, with the character of the leaves of the sterile shoots well brought out, is yet a desideratum. It flowers in our London gardens early in July, a fortnight or three weeks earlier than reflexum, from the smaller forms of which it may easily be recognised by its compressed leaves and very dense rosettes. The original account of the plant given by Dillenius is as follows:—

"Quoniam in rupe D. Vincentii prope Bristolium primum fuit repertum hoc Sedum, ideo hactenus Sedum minus e rupe D. Vincentii dictum fuit. Postea in Cambricæ rupibus, dictis Hisvæ, Lloydio et mihi anno 1725, in Chedderensibus Somersetæ rupibus observatum fuit, quapropter rupestre tantum voco et foliis compressis a Sedo minore luteo foliis acutis C.B. (cujus varietas tantum a Rajo habetur, Sedum minus luteum ramulis reflexis, Ejusd.), cui proximè accedit, distinguo. Porro folia sunt breviora et crebriora, ad basin parte aversa apophysi quadam, violæ caninæ calycis æmula, donata, caules autem teneriores sunt et minus lignosis magis pevoluti, e quorum parte inferiore surculi novi in globulos magis congesti egrediuntur." Dillen. Hort. Eltham., p. 343.

This Cheddar plant, of which the description above given is drawn up from living specimens which I brought from the wild station to Kew two years ago, is the most robust form of the species, and is the variety majus of Dr. Bisswell-Syme, as described in third edition of *English Botany*. This runs down by gradual degrees into his variety minus, in which the leaves of the sterile shoots are not more than $\frac{1}{4}$ inch long, and the flowering stems shorter and more slender.

Var. *S. Forsterianum*, Smith, Engl. Bot., t. 1802, Engl. Flora, vol. ii., p. 322; *S. rupestre* subspecies *Forsterianum*, Syme, Engl. Bot., edit. iii., vol. iv., p. 59; *S. Forsteri*, Haworth, Syn. Succ., p. 117; *S. auricum*, Wirtgen, Flora Preuss. Rheinprov. p. 181; *S. elegans* var. *virescens*, Donck. and Durand, in Bull. Bot. Soc. Belg. xiii., p. 503.—Differs from the type by its bright green, not glaucous, leaves.

This is the Montfaucon plant mentioned by Dillenius. It grows about several of the waterfalls in North Wales, and also in Shropshire. Forster's plant, which was distributed to many botanists from his garden, came from the Devil's Bridge in Cardiganshire. Wirtgen's *auricum*, which is undistinguishable from *Forsterianum*, grows on the hilly banks of the Rhine at Coblenz, Ems, and Ehrenbreitstein, and in Belgium in the province of Liege. I have not seen specimens of the closely allied *S. brevisse*, described by Wirtgen at p. 185 and t 86 of his *Flora of the Palatinat*. F. G. Baker.

(To be continued.)

Home Correspondence.

Melon Growing at Longford Castle.—I am sorry that I was not more explicit in the few remarks I hurriedly made in the *Gardeners' Chronicle* at p. 214 respecting Melon growing here, and for which shortcoming I have called forth an interrogatory voice from Manchester (p. 278), to which call I readily respond. Mr. G. F. Dilymus asks for the length and breadth of the sashes, &c. They are 8 feet long and 4 feet wide, and the compartment in which the Melons are growing consists of four lights, each light having one plant, and each plant four fruits, each crop; hence "four times four" (sixteen fruits) each crop—I trust I shall make myself sufficiently understood this time—making eighty fruits altogether, but

a few either way is of little consequence—all of which, *a maximis ad minima*, were fit for the table, otherwise I should not have written upon the subject. Mr. Didymus asks how about flavour: suffice to say that my noble employer wrote me last May to say that the flavour was excellent. I now send you a fruit of the "fifth" crop for your opinion. I think I have answered all your correspondent's questions, and I hope to his entire satisfaction. Having done so I will now, with your permission, refer briefly to Mr. G. F. Didymus' concluding remarks, when he says that "from the first week in May to August is fifteen weeks, and to finish five crops in fifteen weeks leaves three weeks for each crop," and goes on to say that to flower, set, and swell and ripen a crop of Melons in twenty-one days (I did not say I had done so), and that without much sun-heat, is quick work even in these fast days. I think Mr. Didymus is in error when he says five crops in fifteen weeks. I think, if he refers to the article in question again, he will see there, in very plain type, that we commenced cutting in the first week in May (first crop), and not, as Mr. Didymus reads it, commenced flowering at that date. Thus Mr. Didymus' five is converted into a four. Therefore, he must start with four crops from the first week in May to the 18th of August, at which time I stated the plant were finishing their fifth (say fourth) crop. Now, I think Mr. Didymus will find that there is a difference between "ripe" and "being ripened," and consequently a difference in his calculations. That being so, he will allow that he has given us credit for being faster than we really are, and that he would have been nearer had he written thirty-one days instead of twenty-one days to flower, set, and swell and ripen each crop of fruit. I think, in conclusion, I shall have again to refer Mr. Didymus to the *Gardeners' Chronicle* (p. 214), where he will find me among the Melons, where I have found something not altogether to my surprise, but to my entire satisfaction; and from what Mr. Didymus sees there I think he will infer that each succeeding crop has not only flowered and set, but that the fruits have commenced to swell before the preceding crop has been cut. There is nothing at all wonderful in this. It is true all practical gardeners endeavour to procure an equal and regularly distributed set of fruit on their plants, so that all may swell together; but, nevertheless, another good set can be secured by the time the fruit have done swelling, so long as the plants are treated as they require to be, which means keeping them clean, a judicious application of water (including liquid manure) to the roots and otherwise, thinning and stopping, a suitable temperature, and, above all, not to crop too heavily. There is no reason why—no matter how many crops have been taken from the same plants between May and September—the flavour of the last should not be as good as that of the first, providing the foliage is kept clean, and hot-water pipes at command; at least, such is the humble opinion of *H. D. Ward*.

Glass Coping.—We have a Peach wall, with a due south aspect, the greater part of which has a wide glass coping from which nets were suspended, the same as described by Mr. Sheppard. But the trees have shared the same cruel fate as the remaining part of the wall that had none, so far as the fruit is concerned, but the leaves under the coping were not so badly blistered; so that I hope we may next season derive some benefit from the part so covered. *T. Shingles, Tortkooft Gardens.*

Primula cortusoides.—In a garden at Brighton I have some *Primula cortusoides* now in flower, which, as the bloom declines, throw up a stalk from the centre with a new head of bloom, leaving a circlet similar to the growth of the *Primula japonica*. I mention this as I have not before observed it. In case you may consider it worthy of notice, I could send you a specimen if desired. *W. E. Heathfield.*

Turf: its Uses.—I believe it was Mr. Thomson, of Dalkeith, who spoke so highly of the use of turf for striking Vine sets on. He stated that the roots struck into the turf in a circle, and that this was the plan for growing the roots of the Vine, as when planted out permanently they continued to grow in this form, instead of running away into long straggling roots. I have often weighed this matter, and it is no doubt a plan of great value. I extended this by paying the whole of a wooden trough with turf—forming strata of rotten dung, sand, and turf to a foot in height. As the roots could not extend beyond this trough they in time exhausted all the nutriment from its contents. The surface turf was then taken off, and the roots gently lifted with forks, and the whole contents removed. The same thing was again carried out as before. I have adopted another most important use of turf, and this is the season of the year for it. Procure some good thick turf from an old pasture, and cut it into pieces 9 inches square; then with a broad hoe scrape away 3 inches of soil,

and place the turf grass-side downwards in this hole, draw the loose earth round the edges, and on the top of the turf put a handful of good rotten dung. Place a Strawberry runner on the dung, you will then get plants equal to two years old, and capable of bearing fruit equal to any two-year-old bed. It does not take a long time to prepare a thousand plants. This is one of the best uses of turf I have tried. Again, pave the inside bed of a vinery or orchard-house with turf, placing 3 inches of fine, good mould on the surface, then sow all your annuals in rows—not too thickly, as any seed will grow if good. The first week in June cut out pieces 6 inches by 6, and plant out in the borders. I have now many plots 2 feet in diameter from these pieces growing most luxuriantly, especially Mignonette. A month is gained by this plan. *Observer.*

Orchids in August.—The list shrinks considerably for this month, whose principal business is growth. Nevertheless, there is variety enough to charm the eye of the florist, and many are very beautiful.

Cattleya crispata	Oncidium nobigenum
" Forbesii	" Kramerianum
" marginata	" Papilio majus
" Pinelli	" luridum
Laelia elegans	" incurvum
" Dayana	" trulliferum
" Crispata	" trigetrum
Dendrobium fimbriatum oculatum	" Wentworthianum
" crumenatum	" tigratum
" muschatum	Compartmentia coccinea
" musulatum	Trichopilia fragrans
" calceolus	Polycycnis muscifer (a very remarkable flower, yellowish-brown, on upright spikes about 8 inches in length; flowers profusely, and should be in every collection)
" formosum giganteum	Sigmatostylis radicans (a very prettily-branched plant, the flowers very small but extremely beautiful when closely inspected)
" chrysanthum	Lycaste Skinneri
Saccolabium Blumei majus	" aromatica
" Blumei	" nigrescens
Masdevallia nycterina	Brassavola acaulis
" Veitchii	Brassia Girooudiana
" peristeria	Thunia alba
" Lindeni	Maxillaria venusta
" amabilis	Stanhopea Wardii
" oethodes	Warszewiczella discolor
" myrostrigata	Mesopitidium sanguineum
" Wagneriana	" sulfuratum
" Harryana	Angulosa uniflora grandiflora
Zygopetalum maxillare	Acerides roseum
" Gautieri	Disa Barelli (magnificent)
Miltonia spectabilis	Sobralia macrantha
" candida	Odontoglossum Alexandree
" cuneata	" crocidipterum
" cereola	" Rossii
" festiva	" rubescens
Epidendrum radiatum	" angustatum
" cochleatum	
" speciosum	
" vittatum majus	
" consipicuum	
" macrochilum	
Gongora species	
Cypripedium Sedeni	
" nigrum superbum	
" superbiens	
" niveum	
Oncidium flexuosum	
" Lanceanum	

Odontoglossum angustatum is a very remarkable plant. It has been in flower for four months. The stalk is 9 feet in length, it throws out numerous long branches thickly set with flowers of pleasing and soft shades of brown and yellow, about 1 inch in diameter. These branches are still growing and throwing out new flower-buds. The same bulb has also lately sent forth a second flower stem, already 4 feet in length. I am surprised that so little notice has been taken of this very beautiful and interesting *Odontoglossum*. It should have a place in every collection. It seems to be known to but few Orchid growers. It is very hardy, and flourishes in the coolest house. *Edward W. Cox, Moat Mount, Mill Hill, N.W., Aug. 31.*

Rose Madame de Cambacères.—In reading Mr. D. T. Fish's paragraph, headed the "Roseless Autumn," I should have liked to have seen the above old favourite Rose mentioned in his few true Hybrid Perpetuals. I am afraid it has been discarded by many Rose growers, and why so? Its fragrance is nearly equal to the old Cabbage Provence, and no other Hybrid Perpetual blows so late and free. It has fine foliage, and is one of the hardiest of Roses; in fact I cannot find anything to take its place with me. I am cutting scores of blooms daily from, comparatively speaking, a few plants, having a great demand for cut flowers, Roses more especially. I find no other Hybrid Perpetual flowers so late and free in autumn. *H. Gibbons, Folkestone.*

The Fruit Crops.—A few weeks back I sent you a favourable account of the Apple crop at Danesbury. I now have great pleasure in confirming that report. We have got the very best crop that has fallen to our lot for several seasons. They are clean, healthy, and good in every form, and a fine crop. The following Pears have escaped from the general wreck:—Emile de Heyst, Bauré Rance, Joséphine de Malines, Alexandre Lambre, Glou Morceau, Seckle, Ne Plus Meuris, and Morel. How is it accounted for? Can any one give the reason why, out of nearly one hundred trees, we have about eight or nine

that have got a full crop, while the others are more or less fruitless, and these trees are growing in every point of the compass? *A. Parsons, Danesbury, Welwyn.*

The Roseless Autumn.—I was a little surprised to read the article in last week's *Gardeners' Chronicle* under this heading. I do not know when my Roses have been finer than this autumn, and in many cases they have been even finer than they were in the summer. Mr. Corp, of Oxford, showed as fine (if not finer) Roses at Taunton, Trowbridge, Weston, and Dorchester, as any seen at the summer shows. I do not know where your correspondent lives, but certainly in the West of England we have had by no means a Roseless autumn. *John R. M. Camm.*

"Salus" and the Potato Disease.—When I saw the Potato crop lifted at Heckfield, which had been twice dressed with Salus, I remarked that although the soil generally was light and dry, yet around the roots lifted it was moist and sticky. The destruction there by disease was truly great, and yet all possible care had been taken to ensure success. Mr. McKinlay has at Beckenham the lightest and silkiest soil for the growth of Potatoes I have ever seen. He also tested Salus with a portion of his samples, using two 14 lb. bags of it. He found on lifting the dressed crops exactly the same characteristics as seen at Heckfield—the soil moist and sticky, and, unfortunately for the reputation of the Salus, more disease amongst the dressed crops than in any part of all his growths. If the Salus contains ingredients that possess virtues destructive to the disease, it contains others that equally assist its development, as has been shown in these two cases. In any objective opinions that may be offered as to the benefits derivable from the use of Salus I trust Mr. Smith will be quite prepared to look for entire impartiality. All Potato growers will be only too pleased to be able to award to Mr. Smith all due and proper praise if he really can produce a material that will hold the disease in check. At present I see no evidence to lead me to believe that Salus is in any way calculated to effect that purpose, and farther, I have seen enough to lead me to believe that it may possibly be capable of promoting the disease rather than checking it. Mr. McKinlay has lifted superb clean crops from undressed ground; Mr. Fenn, who also used Salus without deriving any benefit from it, has also done the same. The Lapstone Kidney was his most diseased crop, and of those dressed specially with Salus and those without it, gave of good and bad relatively no appreciable difference. With reference to Mr. Smith's particular trials at Chiswick, to which he refers at p. 277, I would remark that of the sorts he employed in his experiments two only, Lapstone and York Regent, have generally the reputation of taking the disease badly. Early Rose is generally this year very good, and where it has escaped the curl the crop ripened early, and was ready for lifting ere the great wave of the disease—if I may so term it—swept over the Potato crops. Bree's Prolific is a very hard-fleshed tuber, and I can pronounce it to be generally little affected. Striped Don and Victoria are both very robust late-ripening Potatoes, as a rule seldom fit to lift for storing until the end of September, and yet Mr. Smith lifts them on August 24. All kinds of Potatoes take the disease more or less just as they have attained to a certain stage of maturity or otherwise, and it is because of this, and also because the disease generally appears in its most virulent form in mid-season, that second early ripening sorts are as a rule the worst hit. If such kinds as Dawes' Matchless, Red Emperor, Rector of Woodstock, and Scammell's Glory—the latter I have found very diseased this year—had been tried, perhaps the results would have been different. Mr. Smith thinks that the position occupied by the twice dressed crops amidst the fruit trees was the worst, but judging by what I know of the Chiswick soil, I am inclined to think in this case it was the best. Now, in the first place, the open garden soil there is pretty liberally enriched with manure, and that is about the worst possible state of things for the production of a healthy crop of Potatoes. The spaces between the trees are usually employed for the growth of annuals or other catch crops, and is not liberally dressed with manure; moreover, the trees root near the surface, and keep the soil moderately poor. This is, therefore, in favour of the production of fairly healthy tubers. Then in the open the Potato crops were more than once much cut with frost, whilst those planted in the trees were materially sheltered, and this again told in favour of the latter. Again, the heavy rains of the past month rendered the soil very moist, and as in the open there was less absorption than amidst the trees, the tubers and haulm were naturally more prone to the attacks of the fungus. These considerations deserve much more weight than has been attached to them. I can but add that the Chiswick garden seems unfortunately to have become about the worst possible place to conduct experiments and trials in connection with the Potato; and if Salus is to receive another year any-

thing like a satisfactory test, it must be done elsewhere. Some four or five years ago there was a good crop of Potatos at Chiswick; since then there has been general failure. I notice that Mr. Fish has considerably qualified the somewhat positive position that he took up with reference to the Salus in the spring. Looking at the results, this is but natural. Alas! our present knowledge of the nature of the fungus and its mode of operation in the Potato plant but leads me to the conviction that it is, as influenced by external applications, practically indestructible. *A. Dean.*

The Flow of the Sap.—I have read with much interest the able paper on the "Flow of the Sap," by Mr. Andrew Murray, and the various articles on this subject by other contributors; and in order, if possible, to throw some small light on this difficult question, I beg to forward to you two sections of the stem of a young Ash tree (illustrated natural size in elevation and section at A, A, B, B, fig. 62), on which I commenced an experiment for the purpose of ascertaining how long a tree would live after a horizontal section of its bark had been removed. In the summer of 1875 I cut a ring of bark (about 1 inch broad) off the lower part of the stem (C), taking care not to allow the knife to enter the wood; some time afterwards I noticed that the leader of the stem was making little progress and that the young leaves were not developing

also be seen that the lower end of these two new layers of wood is freely below the top of the rings of bark when first removed (G, G). From this it apparently follows that the sap to form these layers of wood must have descended. I refrain from making any definite assertion as to what the true course of the flow of the sap may be; but it appears to me that the sap ascends both by the internal vascular portion of the stem and by the bark, and on reaching the leaves receives a portion of its carbonic acid from the air, and descends on the outside of previous year's growth of wood, forming a layer of cambium and new bark cells. This idea may be erroneous, but in the (to me) absence of anything more probable, one can ask to be excused for entertaining it till a more conclusive proof than that of Mr. Murray's be given that it is untenable. Allow me to say that the above is not written in a spirit of mere controversy—if it add anything to the furthering of a true knowledge being got on this extremely interesting subject, my object will be gained. *A.*

The Prairie Rose.—*Rosa setigera*, or the Prairie Rose, a native of the Western and Middle States, is one of our most ornamental midsummer hardy plants. The blooms are single, deep rose, and produced in dense corymbs along the arching and climbing stems, from twenty to fifty flowers in bouquet-fashion terminating each branchlet. These Prairie Roses are pro-

your columns, it may be interesting to note that this plant has been used and claimed from a very early date by the Earls of Sutherland as the distinguishing badge of their followers and clan. The present Duke of Sutherland, as Earl and chief of the clan, still retains it, and, although the old feudal times have passed away, every Sutherland Volunteer still wears a sprig of Butcher's Broom on the bonnet as part of the uniform on review and field days. This plant is well suited for such a purpose from its erect prickly habit, and it also retains its green colour for a long time after being cut. Some very old plants, still full of vigour, grow in the old part of the gardens here. They have no doubt provided many a badge in more troublous times than the present. They still furnish an annual supply of about 500 pieces for the Volunteers. During the period the Highlanders were divided into clans or tribes, considerable importance was attached to these badges or crests. Logan, in his work, *The Scottish Gael*, says, "The painted shields, the crests or badges worn on the head, the standards and strictly-regulated patterns of their garments, were the insignia by which the Celtic warrior was distinguished and his tribe recognised." He then gives a list of the plants worn as badges or crests by the Scottish clans, and states that "For carrying these marks of distinction after 1745, some Frasers and Mackenzies were subjected to the penalties of the Disarming Act." The use of plants or flowers as badges was not confined to

FIG. 62.—EFFECT OF GIRDLING TREES.

as quickly as those on the adjoining trees, thus showing that part of their nourishing elements had been interfered with or intercepted. For about two months the tree continued to grow very slowly, and a second ring of bark (about 1½ inch broad) was removed from the stem about 20 inches above the other ring (D); this had the effect of still further hindering the growth. The length of the leader formed in the year (1874) previous to the removal of the rings of bark was 28 inches, in 1875 (year of removal of bark) it was 3 inches, while in 1876 it only grew 4 inches. Unfortunately for the object which I had in view, the cutting of the Ash in the winter of 1876 was rendered necessary, as several large trees close by were being felled. However, from the foregoing it will be seen that a part (of no inconsiderable amount) of the sap ascends by the bark. Having preserved the tree as a specimen, and on seeing Mr. Murray's new proposition as to the flow of the sap, it occurred to me that some information regarding this matter might be got by sawing the stem up the centre, and examining the sections: from these it will be observed that no growth took place upwards from the bottom of either ring, and that the bark from the bottom of these rings downwards to the next lateral branches is quite dead (E, E); showing that no sap can ascend in the bark without the pumping action of the leaves. Now in support of the theory that the sap must descend it will be noticed that there are two layers of new wood (one for each year, 1875 and 1876) above the top of the rings (F, F), while there are no new ones in the stem below the lower ring; and it will

fuse bloomers, bright and pretty, and coming into perfection as they do all through July, some weeks after our garden Roses are past, are quite desirable. They are, too, hardy, and no matter whether isolated or cramped up with other shrubs and Vines, providing they get sun and a rich soil they are quite at home. *William Falconer, August 22.*

The Potato Crops.—I am at a loss to know who is to blame or who will forgive your correspondent for the report you published a few weeks ago respecting the Potato crop. I only know that if I had to send in another report, it would be a very different one, for long before your paper reached the hands of your subscribers the Peronospora or blight had made its appearance in the most violent form. In the whole of my experience I never saw it come on so rapid—it is positively distressing! The cottage gardens and fields are all alike; in this place our crops are simply rotten! And the weather continues as bad as it can be. I expect we shall not be able to save one half enough for the winter supply. *A. Parsons, Danesbury, Welwyn.*

Pittosporum Tobira.—This evergreen tree, from New Zealand, has proved hardy here during the two last winters (out-of-doors). *G., Bath.* [It is quite hardy on the south coast, where it flowers well. *Eds.*]

Butcher's Broom as a Badge or Crest.—While the Butcher's Broom is being under consideration in

Scotland. The Wars of the Red and White Roses forms an interesting chapter in English history. *D. M., Dunrobin.*

Reports of Societies.

Royal Horticultural: Sept. 4.—As usual at this season, the meeting to-day was a small one, and thinly attended.

FLORAL COMMITTEE.—G. F. Wilson, Esq., in the chair. Mr. Cannell, of Swanley, showed a dozen bunches of cut blooms and half-a-dozen flowering plants of his new striped Pelargonium New Life, and received a First-class Certificate for it as a decorative plant. Mr. Cannell also sent a fine stand of Cockscombs; also cut blooms of several new Zonal Pelargoniums, including Mr. Jean Sisley's valuable new break Dr. Denny, the pips of which are of a bright magenta colour, with a blotch of orange on the two lower petals, and which, though not shown nearly so fine as at Chiswick the other day, was highly commended by the committee. Mr. Parker, Tooting, showed a cut panicle of flowers of that fine hardy plant *Hydrangea paniculata grandiflora*, and also cut spikes of the beautiful blue *Lobelia syphyllitica*, an old hardy herbaceous plant, which does equally well, if not better, on a bog as in the open border. Of the merits of the *Hydrangea* really but little is known at present, but after seeing it in Mr. Parker's nursery one cannot do otherwise than strongly recommend it. Mr. Parker has 130 plants in a row, each of which is

about 18 inches high, and bears from two to three glorious panicles of white flowers. It is as hardy as the common Lilac, and a most valuable plant for a row or for mixing (see *Gardeners' Chronicle*, 1875, p. 652, fig. 135). Mr. Craike, The Gardens, Sand Hall, Howden, Yorkshire, sent a specimen of a Coleus under the name of Miss Schollefeld, which could not be distinguished from the variety sent out some time ago by Messrs. James Carter & Co. as Dachsen of Edinburgh. From Messrs. James Carter & Co. came some immense and very perfect flowers of the African Marigold. Mr. George, Putney Heath, showed some cut blooms of some brightly coloured hybrid Ivy-leaved Pelargoniums named Nemesis, St. George, and Gem. Messrs. J. Laing & Co. sent a close, upright-growing form of *Neprolepis exaltata* named compacta; and Sir Henry Peek, Wimbledon House, S.W., received a vote of thanks for a fine specimen of the distinct *Oncidium lanceanum*. G. F. Wilson, Esq., showed a fasciated flower-stem of *Agapanthus umbellatus*, and from Mr. J. Stokes, gr. to Mrs. Charles Crossland, Crossland Lodge, Huddersfield, came cut flowers of two seedling *Lapagerias*, the one being of fine size and of a nice mottled shade of crimson, and the other pink flushed with crimson. The last named is the greatest novelty, and may prove a useful acquisition. Mr. Kinghorn, Sheen Nursery, Richmond, showed cut flowers of the fine old *Tropaeolum speciosum*, a plant which grows like a weed in Scotland, but which is difficult to grow in the South; but Mr. Kinghorn has succeeded in flowering it very freely this season. From Mr. G. Smith, Edge Lane, Edmonton, came a nice stand of Dahlias, and a similar one was contributed by Mr. Rawlings, of Romford. Mr. Turner also sent a few new Dahlias, as well as cut blooms of the distinct new *Petunia*, Mount Beauty. Mr. John Keynes, Salisbury, also sent a fine lot of Dahlias, and was awarded First-class Certificates for the following varieties, all of his own raising:—*Louisa Neate*, a finely formed flower, pale pink with a white centre; *Charles Wyatt*, a fine fancy variety, deep pink, striped and blotched with crimson; *Bessie Ford*, rich pink, shaded with rose; *Henry Bond*, a large bright rose flower; and *The Countess*, white flushed with crimson, and a dark centre. Messrs James Veitch & Sons received a vote of thanks for a fine display of seedling *Begonias* raised from the open ground, and which further went to show the value of these attractive plants for bedding out. From the Society's Gardens, Chiswick, came a choice assortment of Asters, of which a most interesting trial has been carried out this season.

FRUIT COMMITTEE.—J. Lee, Esq., in the chair. Mr. Gilbert, gr. to the Marquis of Exeter, Burghley Park, Stamford, sent examples of five Kashgar Melons named *Bhikki Kutchgar*, *Lobiani*, *Na-Shakar*, *Anabat*, and *Yori Kand*. The first four are all of a pale green colour, with darker longitudinal bands of green, and very bad in quality. The best of all was *Yori Kand*, an oval-shaped, white-fleshed variety; but had indeed was the best. Several new varieties of Peaches and Nectarines came from Messrs. Thomas Rivers & Sons, Sawbridgeworth, but they were not in good condition for judging. Good ripe fruits of *Souvenir du Congrès*, *Summer Beurré d'Aremberg*, and *Williams' Bon Châcien* Pears, all grown on pot trees, were shown by Mr. Douglas, gr. to F. Whitburn, Esq., Loxford Hall, Ilford; and from the Society's garden at Chiswick came an interesting collection, comprising samples of thirty varieties of Tomatos.

Great International Horticultural Exhibition: Carlisle, September 6.—[By Special Telegram.]—The entrance tent is reached by a covered way, and is 200 feet long and 50 feet wide, and is thinly filled with excellent specimens of stove and greenhouse plants, florists' flowers, and subjects of a miscellaneous description. At the end is a central marquee 100 feet in diameter, with a large group of fine-leafed plants in the centre, contributed by Messrs. Little & Ballantyne of this city, and smaller groups radiating from it of Palms, Ferns, &c., from various other sources, together with an outer staging filled with small plants of various kinds from Messrs. Barron & Son, of Elvaston Nurseries, Borrowash, Clark Bros. & Co., and Thos. Armstrong, of Carlisle. From this circular marquee three other long tents are reached. The first one on the left is about 80 feet long, and contains a miscellaneous assortment of florists' flowers, cut Roses, Pansies, Violas, Dahlias, &c., together with several meritorious exhibits of skeleton leaves, flowers, and seed-vessels. Next comes the fruit tent—the most disappointing part of the whole, but still by no means the least interesting to the non-professional visitor. Then follows a tent 300 feet long by 40 feet wide, with two rows of 4-inch piping running all round, and most efficiently heated, so far as we saw, by one of Hartley & Sugden's (Halifax) patent Climax boilers, which was highly commended by the judges. The piping was fixed by Mr. Corbett, of Corporation Road, Carlisle, and the work does him credit. This tent holds the most

valuable lot of subjects on the ground, including magnificent groups of new and rare plants from Messrs. Veitch, B. S. Williams; Ireland & Thomson, Craigleith Nursery, Edinburgh; J. & B. Thyne, Glasgow; Dickson & Co., Chester; and several others.

In another part of the show-ground, or we should say swamp, a long tent is devoted to vegetables, not many of them, nor particularly good in quality; and another to dinner-table decorations, which, on the contrary, are above the usual run of such displays, and really good. These are the whole of the tents—a grand lot of canvas it must be admitted, and all put up by Unite, of Paddington, and lighted with gas by the city authorities.

FRUIT.

The judges commenced their labours, as usual at these northern shows, at 6 A.M., and by the time we reached the grounds, at 7 A.M., their work was nearly over. We found that in the first class, for a collection of sixteen sorts of fruit, containing not more than four sorts of Grapes, two of Pines, and two of Melons, Mr. Johnstone, gr. to the Earl of Strathmore, Glamis Castle, Forfar, was just beaten by Mr. Coleman, gr. at Eastnor Castle, who took the £20 offered as a 1st prize with splendidly finished samples, not over large, of Madresfield Court, Black Hamburg, Muscat of Alexandria, and Black Morocco Grapes; good Jargonelle Pears, Morellos, Bellegarde and Crimson Galande Peaches, Golden Gem, Eastnor Castle and Queen Emma Melons, Brown Turkey Figs, Pitmaston Orange and Elrage Nectarines, Diamond Plums, Smooth Cayenne and Jamaica Pines, all of exceedingly good quality. Mr. Johnstone has by far the best Grapes, large bunches well filled out with good-sized, well coloured and perfectly finished berries. His varieties are Black Alicante, Muscat of Alexandria, Black Hamburg, and Barbarossa, good Queen and Smooth Cayenne Pines, Peaches, Nectarines, Plums, Melons, and Figs, but very little behind Mr. Coleman's in quality. Mr. Ingram, gr. to the Duke of Northumberland, Alnwick, is 3d, his most noteworthy exhibits being a fine dish of Trebbiano Grapes and a nice bunch of Bananas. These are the only competitors. In the most important class, which was for a collection of twelve sorts, Pines excluded, there was a much better competition, and the highest prize, £15, goes to Mr. Wallis, gr. to Sir H. Thomson; and the 2d to Mr. McKelvie, gr. to the Duke of Roxburgh, Broommouth Park, Dunbar. The first-named has Muscat and Black Hamburg, Buckland Sweetwater, and Muscat of Alexandria Grapes, all fairly good; while Mr. McKelvie has superior samples of Muscat of Alexandria and Black Prince, the latter shown under the name of Southend Black. Mr. W. B. Upjohn, gr. to the Earl Ellesmere, Worsley Hall, Manchester, comes in 3d, and the gr. to J. Whyte Melville, Esq., Mount Melville, St. Andrews, 4th—the latter having, amongst others, the best sample we have seen of the Duke of Buccleuch Grape, which, like Golden Champion, is by no means plentiful here.

The class for ten sorts, Grapes and Pines excluded, is a poor one. Mr. Shand, gr. to the Earl of Lonsdale, Lowther, is 1st, and Mr. H. Graham, gr. to J. Allan, Esq., Craigieburn, Moffat, is 2d.

Pines are a very poor show. The best Queens come from Mr. Ingram, gr., Alnwick Castle, and from Mr. Sandford, gr. to the Earl of Bective, Underley Hall. Of collections of eight varieties of Grapes there are only three exhibits, and the first two prizes go, in the order named, to Mr. G. Reed, gr. to A. H. Moncur, Esq., Rockfield, Dundee, and to Messrs. H. Lane & Son, Berkhamstead. The first-named has a large and beautifully shaped bunch of Barbarossa as his centre of attraction, and smaller but certainly good samples of Muscat of Alexandria, Lady Downes, Black Hamburg, Black Alicante, Mrs. Pince's Black Muscat and Gros Colman, the latter especially being fine in berry, but not quite up to the mark in colour. Messrs. Lane's Grapes are very good, but not in their usual style.

There are no less than fourteen collections of four varieties of Grapes, but they are mostly unripe, and as a rule bad. The 1st prize is easily won by Mr. J. R. Hammond, gr. to Sir Wilfrid Lawson, Brayton Hall, with clean and well finished samples; Mr. Coleman, Eastnor Castle, is 2d; Mr. A. Kirk, gr. to Mrs. Mackie, Ernespie House, Castle Douglas, 3d; and Mr. J. Curror, gr. to J. Douglas, Esq., Eskbank, Edinburgh, 4th. There are twelve lots of two bunches of Black Hamburgs, but they are mostly bad. Mr. Coleman is 1st, and Mr. Upjohn 2d. Messrs. Lane & Son are 1st for a pair of bunches of Muscat; and Mr. D. Fraser, Stobo Castle, 2d for two bunches of Madresfield Court, good samples in all respects but colour. The best Lady Downes' come from Sir Wilfrid Lawson, whose Black Alicantes are also very perfect in berry, colour, and finish. Mrs. Pince is represented by a brace of fine bunches, about 3 lb. weight, only wanting in colour to make them perfect. The class for two bunches of Muscat of Alexandria is a particularly

good one. Mr. McKelvie, gr. to the Duke of Roxburgh, is 1st, with a grand sample; 2d, Mr. A. Ferguson, gr. to B. Shawley, Esq., Cavick Hall, Selby; and 3d, Mr. Coleman of Eastnor Castle Gardens. The Duke of Buccleuch is best shown by Messrs. Wm. Thomson & Son, Clovenfords; and Buckland Sweetwater by Mr. J. Curror. In the last class, that for any other white Grape, Pearson's Golden Queen is shown by Mr. Anderson, gr. to the Earl of Stair, Oxenford Castle. The heaviest bunch of the black Grapes is one of Alicante, weighing 6 lb. 13 oz.; and the heaviest white, one of Syrian, weighing 9 lb. 3 oz.; both being shown by Mr. Dixon, gr. to J. Jardine, Esq., Arkleton. The 1st prize for one bunch, finest bloom, not less than 1 lb. weight, comes from Mr. Lees, gr. to the Marquis of Downshire, Hillsborough Castle, Co. Down, the sort being called Cooper's Late Black, whatever that may be.

Peaches, Nectarines, Melons, and Plums are not particularly good classes, and were it not for large and admirable collections of Apples and Pears sent by Mr. Jones, gr. to the Queen at Frogmore, and by Mr. Miles, gr. to Lord Carington, the display in those departments would have been equally poor. The 1st prizes in the class for a collection of hardy fruits, given by J. Jardine, Esq., of Arkleton, is won by Mr. Sandford, gr. to the Earl of Bective. It is a fairly good class, and that is all that can be said of it. As a rule, the hardy fruits are all poor, and, therefore, the amateur classes need not be more than mentioned.

In the classes devoted to fruits of Continental growth there is only one exhibitor, M. Adolphe d'Haene, of Ghent, who sends a selection of Apples and Pears and takes a 1st prize. This is the extent of the international character of the show. Amongst miscellaneous subjects must be mentioned a meritorious lot of Citrons, &c., from Mr. J. Muir, gr. to C. R. Mansel Talbot, Esq., Margam Park, Glamorganshire.

PLANTS.

In this department there is a good display, but the subjects sent in are rather thinly spread out, and do not strike us, as a whole, as being so good as at previous shows in this part of the country. The 1st prize of £20 for twenty stove or greenhouse plants is well won by W. Troughton, manager to the Nursery and Pleasure Gardens Company at Preston, who stages a handsome specimen of *Lapageria rosea*, fine examples of *Cycas revoluta*, *Phenacoma prolifera*, *Croton Weismanni*, *Cocos Weddelliana*, fine tall specimens of *Alsophila australis*, *Dicksonia antarctica*, *D. squarrosa*, *Dion edule*, and *Cycas circinalis*. For twelve new plants not yet in commerce Mr. Bull is 1st with *Alcascia Johnstonii*, *Bowenia spectabilis serrulata*, *Croton triumphans*, *Aralia splendensissima*, *Dieffenbachia Shuttleworthii*, *Dracaena Goldiana*, *Curmeria marmorata*, *Martinezia Roezlii*, *Croton formosus*, *Aralia ornata*, *Dieffenbachia regina*, and *Zamia princeps*; and Mr. B. S. Williams comes in 2d with very good specimens of *Cibotium nigrescens*, a striking new Tree Fern; *Nepenthes phyllamphora variegata*, *Aralia nobilis*, *Dracaena Bausei* and *Scottii*, *Croton Prince of Wales*, &c.; Messrs. J. & R. Thyne, of Glasgow, are 3d, with large specimens of *Calamus Goldieanus*, *Hechtia Maclellani*, *Dieffenbachia Thuynei*, and *Aralia neo-caledonica*. Mr. Bull's cups were won by J. M. Shuttleworth, Esq., Howick House, Preston; Mr. J. Hammond, gr. to Sir W. Lawson; and by Mr. J. McIntyre, gr. to A. A. Richardson, Esq., Lisburn, Ireland. Mr. Shuttleworth's are a grand lot of new plants, including *Plectocoma Andersoni*, *Encephalartos villosus amplius*, *Sadleria cyatheoides*, *Dipladenia Brearleyana*, a finely bloomed plant, *Crotons Disraeli* and majestic, *Bertolonia superbissima*, *Lomaria Dalginensis*, and *Macrocramia plumosa*, &c. Mr. Shuttleworth also sends the best dozen stove and greenhouse flowering plants, including magnificent specimens of *Gleichenia dicarpa*, 6 feet high and the same through, *Phormium Colensoi variegatum* almost as large, *Allamanda nobilis*, *Dipladenia insignis*, all large and profusely bloomed, and a remarkably fine plant of *Lapageria rosea*, well flowered. Mr. Todd, gr. to A. B. Stewart, Esq., Rawcliffe, Langside, is 2d. The best six come from J. Hammond, Sir W. Lawson's gardener, and the same exhibitor is also to the front with half a dozen fine-leafed plants. Of dinner-table plants the display is excellent, the entries being numerous, and the plants staged thoroughly good for the work intended. Mr. Shuttleworth, Preston, comes in 1st; Mr. Todd, 2d. For a dozen new plants for the same purpose, Messrs. J. & R. Thyne are well 1st, and Messrs. Clark Brothers & Co., Carlisle, 2d. Of the other plants shown in lots we need only say that they are of fair average quality, and call for no comment except perhaps in the case of *Lilium*, which are especially well shown by Mr. Shand, gr. at Lowther Castle.

The TABLE DECORATIONS are prime features in the display and a source of much local interest. There are eleven competitors, and for a wonder not a particularly bad example amongst them. The 1st prize, a cup, value £25, given by Lady Musgrave, Eden Hall, Penrith, was deservedly awarded by the lady judges

to Mr. James Cypher, of Cheltenham, who put up one of the lightest and prettiest tables we have seen. Everything used is of the best quality, and the design is put together very thinly and with good taste. From the light and elegant the ladies jumped to the severely heavy, in giving the 2d prize to Mr. Shand, gr., Lowther Castle, whose table, though neatly arranged, is much too heavy and contains too much colour. The 3d is awarded to Mr. Lewin, gr. to Colonel Buchanan, Drumpeilier.

Cut flowers are not shown to anything like the extent we expected, and include nothing out of the common order.

CONIFEROUS PLANTS are well showed by Messrs. Barron & Son, Elvaston Nurseries, Borrowash; Dickson & Turnbull, Perth; and Little & Ballantyne, Carlisle, who take the prizes in the order named. In the class for fifteen specimens Messrs. Barron & Son have splendid examples of *Abies Alconquiana*, *A. Parryana*, *Picea magnifica*, *Nordmanniana*, *Parsonsiana*, and *bracteata*; *Retinospora plumosa aurea*, *R. filifera*, and *R. obtusa compacta*; *Arthrotaxis selaginoides*, *Biota elegantissima*, *Cupressus Lawsoniana lutea* and *erecta viridis*, *Thujaopsis dolabrata variegata*, &c. Messrs. Barron & Son are also 1st for six hardy Conifers not yet introduced into commerce, with *Podocarpus alpina*, *Wellingtonia gigantea lutea*, *Retinospora tetragona anrea*, *Picea concolor*, *Retinospora pisifera aurea*, and *Cupressus Lawsoniana elegantissima*. The 1st prize for a new hardy Conifer of real merit is won by Messrs. Little & Ballantyne, with their very handsome *Wellingtonia gigantea pendula vera*, a very distinct plant, to be sent out this autumn.

Of the display of VEGETABLES we can only say that it, too, is not up to the mark, the number shown being under the usual autumn quantity, and certainly inferior to the Northern standard of excellence, and to the Southern too for that matter. Mr. Sandford, gr., Underley Hall, sends the best collection of twenty sorts, and Mr. Nichol, gr. to J. A. Cory, Esq., Botcherby, comes in 2d. In the class for ten varieties the competition is very much better, and certainly there is a better class of produce here. G. Bloxholm, gr. to Sir P. Duncombe, Brickhill Manor, Blechley, is 1st with the nearest lot of all. In the amateur's classes the samples are both numerous and fairly good.

MISCELLANEOUS GROUPS of plants are contributed most liberally by Messrs. Veitch & Sons, B. S. Williams; James Dickson & Sons, Newton Nurseries, Chester; Ireland & Thomson, Craigleith Nursery, Edinburgh; R. Thyne, Glasgow; R. P. Kerr & Sons, Aigburth Nursery; and R. Pattinson, Carlisle, all of whom are "commended" or "highly commended" by the judges in the show ground.

Messrs. Little & Ballantyne have a fine stand for the display of seeds, dried grasses, and cereals and garden cuttery, for which a silver medal is awarded. Horticultural buildings are shown by Messrs. Boulton & Paul, of Norwich, and Richardson & Co., Darlington; the Hudley Lawn Mower by Mr. Parkinson, Ripon; garden furniture by Haughton & Thomson, Carlisle; boilers by Hartley & Sugden, Halifax; summer-houses by H. Inman; and wirework by J. Branban, Dale Street, Liverpool.

The judges made an inspection of these, but the rain prevented our learning with what results. All the tents are efficiently lighted with gas at night, and fitted with patent pneumatic bells, by Corbett, of Carlisle. It is most unfortunate that the weather should have turned out so unfavourably, as the committee have gone to an enormous expense, and the entries promised a magnificent show.

Basingstoke Horticultural: August 21.—This is an old exhibition resuscitated, after being allowed to lapse for several years. The show itself was very creditable a s a first attempt, and improvements in the general cultivation of the plants will be certain to follow. There were enough to fill three spacious tents, and a small one had to be improvised to take a miscellaneous collection of plants that was crowded out of the larger tent.

The principal exhibitors for competition were Wyndham Portal, Esq., Malshanger Park (Mr. N. Kneller, gr.); W. L. Chute, Esq., Basingstoke (Mr. G. Broomfield, gr.); T. Pain, Esq., Basingstoke (Mr. T. Russell, gr.); Major Warren, Basingstoke (Mr. Osman, gr.); the Rev. Mr. Fitton, Laverstoke (Mr. H. McLean, gr.); the Rev. Mr. Fraser, Basingstoke (Mr. E. Roberts, gr.); and Dr. Webb (Mr. Penford, gr.)

The display of plants was not large, but they were on the whole pretty well grown. Mr. N. Kneller had the best six foliage plants, consisting of *Dracæna terminalis*, *Gymnogramma sulphurea*, *Coleus the Chan*, *Croton irregularis*, *Caladium Chantini*, and *Cyanophyllum magnificum*. The best six exotic Ferns came from E. Bates, Esq. (E. Turner, gr.), nice, well-grown, small-sized plants; and the same exhibitor had a good and varied collection of hardy Ferns. *Achimenes*, *Fuchsias*, *Balsams*, *Pelargoniums*, &c., were also shown. In the amateurs' classes there

was generally a good competition with plants, which were on the whole small in size, but clean and nicely bloomed. Under the head of miscellaneous a good group of *Crotons*, *Ferns*, *Palms*, &c., was shown by Mr. Hibbert, gr. to W. B. Beach, Esq., Oakley Hall; and a useful group came from Mr. Dauncey, gr. to Branston Slane, Esq., while a collection of flowering plants, useful decorative stuff, came from Mr. G. Cooper, florist, Basingstoke.

The best collection of eight dishes of fruit came from Mr. Kneller, as also did the best three bunches of Black Hamburg and Buckland Sweetwater Grapes, also the two best Melons. In the scarlet-flashed class Sutton's Hero of Bath was very fine in quality.

Vegetables were capitally shown, Mr. Kneller having the best collection of ten distinct varieties. There was a handsome special prize for a collection of eight varieties of Potatoes, and this also fell to the lot of Mr. Kneller, who had capital examples of Late Rose, Waterloo Kidney, Blanchard, Schoolmaster, Sutton's King, Birmingham Blue, Snowflake, and one other. By several exhibitors Salmon Kidney was shown under the name of Bountiful, leading to the supposition that it has been distributed under that name. (From a Correspondent).

Trowbridge Horticultural: August 22.—As usual, the show ground was literally crammed with visitors towards evening. From the surrounding districts they come into the town thickly in the morning, the early part of the day is spent in examining the decorations in the town, soon after mid-day a general move takes place to the show ground adjoining the railway station, and as soon as the cheap admission commences the tents speedily become almost impassable.

It was said to have been the best show of fruit for the last three years. The best ten dishes came from Mr. King, gr. to R. V. Leach, Esq., Devizes Castle, who had Black Alicante and Muscat of Alexandria Grapes, Bellegarde and Barrington Peaches, Prince of Wales and Pitmaston Orange Nectarines, Melons, Moor Park Apricots, Green Gage Plums, and Morello Cherries. Mr. Squires had the best two bunches of Black Hamburg Grapes, as well as the best two bunches of White Muscat. The best black Grapes other than Hamburg were Muscat Hamburg from Mr. J. White, in excellent condition; Mr. King coming next with some well finished examples of Black Muscat. Dessert Pears were represented by Jargonelle and the Wiodsor Pear; dessert Apples by Summer Stibbert, Fletcher's (?), Red Quarrenden, Red Astrachan, Carnation (?), very handsomely striped with red, a fine early variety; and Kerry Pippin: culinary Apples by Lord Suffield, Cox's Orange Pippin, Emperor Alexander, Newtown Pippin, and Manks Codlin; Nectarines by Pitmaston Orange and Elrage; Peaches, which were generally very good, by Noblesse, Royal George, Grosse Mignonne, and Violette Hâtive. The best red Plums were Kirke's, Orleans, Magnum Bonum, Victoria, and Goliath; white varieties were represented by Washington and Green Gage. Apricots were very good, the season considered.

Fuchsias are always the leading characteristic among flowering plants, and they were on the whole extremely well done this season. The best six as well as the best four came from Mr. Matthews, gr. to W. B. Brown, Esq.; Trowbridge. As usual the plants were large, well grown, and beautifully flowered. The group of six comprised Souvenir de Chiswick, Alba coccinea, a beautiful plant, and a charming exhibition variety; Doel's Favourite; Marginata, very fine; Rose of Castille, very fine; and Marchioness of Bath, admirably done. The group of four comprised Pauline, Rose of Castille, British Sailor, and Lustre. On this occasion Mr. Lye, gr. to the Hon. Mrs. Hay, Market Lavington, had to take second honours in both classes, having in his group of six plants, Queen Victoria, Charming, Hon. Mrs. Hay, Delicata, Purity, and Doel's Favourite; and in his group of four varieties Marginata, Scarlet King, Rose of Castille, and a fine dark seedling. Mr. E. Hobbs, gr. to J. Gayton, Esq., Trowbridge, was 3d in both classes. As usual *Petunias*, *Fuchsias*, *Balsams*, *Cockscombs*, *Zonal Pelargoniums*, &c., were finely shown.

Stove and greenhouse plants, as well as foliaged plants, were scarcely up to the mark, but all the growers complained of the season. Exotic Ferns were plentiful and generally good, but mostly of medium size, because of the extent of the leading collections, as many as eighteen distinct kinds being required.

Vegetables were largely shown in all the classes, and of superb quality. The cottagers' tent was a show in itself, so good were all the exhibits. Potatoes were particularly numerous, large, clean, and handsome. Many old varieties are known there under local names, but some of the cottagers' trays contained from twenty to thirty varieties.

In the cut flower classes Dahlias are always a feature, as Mr. Keynes, of Salisbury, makes a point of exhibiting at Trowbridge; and indeed he is looked

upon as one of the pillars of the exhibition. His stand of twenty-four varieties, all the blooms in which were remarkably fine, comprised Royal Queen, James Cocker, Flag of Truce, J. N. Keynes, James Service, Mrs. Stancomb, Burgundy, Henry Walton, Jno. W. Lord, Baron Taunton, Thomas Godwin, Queen of York, Vice-President, Queen of Beauties, Alexander Cramond, Harriett Tetterill, John Wyatt, Mrs. Downie, William Lewis, Hon. S. Herbert, Lady G. Herbert, George Goodhall, and Prince Arthur. Mr. Thomas Hobbs, Lower Easton, Bristol, was 2d, with much smaller flowers. Mr. Keynes' stand of twelve fancies consisted of Octoroon, Rev. J. B. Camm, Richard Dean, Fanny Sturt, Mrs. Saunders, Henry Glasscock, Samuel Bartlett, Miss Lilly Lange, and seedlings. The best seedling Dahlia of 1877 was Eclipse (Keynes), pale primrose, heavily tipped with orange-brown—a flower of high-class quality; Charles Wyatt, a wine-purple ground, fancy, flaked with crimson, was remarkably fine; as near perfection in a fancy as can well be imagined. Both the foregoing received First-class Certificates of Merit, as did also Louise Neate, pale apple-blossom, a charming flower; George Barnes, Henry Bond, Maid of Athens (fancy), and Cleopatra, rich glowing red, intense in colour.

Messrs. Kelway & Son, Langport, staged a fine lot of Gladioli, in their usual admirable style, some of them seedlings of rare merit, and to the following First-class Certificates were awarded:—Helena, Vemileus, Crown Prince, Buteo, Charmante, very rich in colour; Scepas, and Semile. (From a Correspondent.)

Reading Horticultural Autumn Show: August 23.—It is worthy of remark that, while the season has proved generally unfavourable to plants, fruits, &c., certain exhibitions have been unusually fine notwithstanding. A striking illustration of this was afforded at Reading on the above date, for, as a whole, the show was one of the best held for years. The large exhibition tent was completely filled, and the exhibits were admirably arranged by Mr. Phippen, the superintendent. The Forbury gardens, too, which form an excellent approach to the Abbey ruins, in which the shows are held, are now at their very best.

The leading feature was the class for nine stove and greenhouse plants, and here Mr. E. Tudgey, gr. to J. F. Williams, Esq., Henwick Grange, Worcester, was well ahead with good examples of *Allamanda nobilis*, *Ixora aurantiaca*, *Erica Fairrieana*, *Clerodendron Balfourianum*, *Erica Austiniiana*, *Statice profusa*, and *Anthurium Scherzerianum*; 2d, Mr. W. Lees, gr. to Mrs. Marsland, Reading, whose best examples were *Allamanda Schottii*, *Bougainvillea glabra*, *Pentas carnea*, and *Scutellaria Mociniana*. With four plants, Mr. G. Parham, gr. to G. May, Esq., Reading, was 1st, having nice examples of *Vinca alba*, *Lantana Le Grenadier*, *Bougainvillea glabra*, and *Allamanda Hendersonii*. There were some good single specimens of stove and greenhouse and foliaged plants, which greatly helped the show. Probably some of the best-grown *Lycopods* ever seen were furnished by Mr. S. Mortimer, gr. to Major Storer, Purley Park. The group comprised an admirable selection, excellently grown, viz.:—*Selaginella cæsia*, *Martensii*, *Martensii variegata*, *Kraussiana*, *Kraussiana variegata*, and *stolonifera*. The best group of nine foliaged plants also came from Mr. Tudgey, who had *Croton Veitchii*, *Cycas revoluta*, *Lantana horbonica*, *Stevensonia grandiflora*, *Dracæna Shepherdii*, *Dasylyrium acrotrichum*, *Croton interruptus*, *Cordylloe indivisa*, and *Pritchardia pacifica*—a capital lot. The best group of exotic Ferns came from Mr. J. C. Higgs, gr. to Mrs. Crawshaw, Reading, and they formed a bold feature at one end of the tent.

Variegated *Pelargoniums* were well shown by Mr. Ashby, gr. to Mrs. Fanning, Reading, some of the best-finished plants seen this season; and by Mr. J. F. Mould. The 1st prize group of six bedding *Pelargoniums*, from Mr. S. Mortimer, were well done, and as they comprised fine exhibition varieties their names are given, viz.:—Premier, Clipper, Rose Bradwardine, Lord Derby, Mrs. William Paul, and Excellent.

Mr. W. Lees was 1st with six *Fuchsias*, but a long way behind the West of England exhibition style. Mr. J. F. Mould, had some well-grown *Ericas*. *Lilies* in pots were a good feature, so were *Cockscombs*, *Coleus*, *Balsams*, &c.

The groups of plants for effective arrangement were well set up on this occasion; Mr. G. Parham was 1st. This is a favourite feature of the Reading people, and the decisions of the judges are freely criticised. Of cut flowers Messrs. Phippen & Robinson set up a capital stand of twenty-four bunches, which was a great improvement on the bouquets of previous years. This stand included some good hardy things, the pretty *Physostegia imbricata* being very attractive. Mr. Tudgey had the best twelve bunches of stove and greenhouse flowers, and all the exhibits in this class were highly meritorious. The best twenty-four Dahlias came from Mr. Jackson, nurseryman, Kidderminster. The best twenty-four Roses came from Mr.

Corp, Oxford, very fresh and nice. Gladioli and Asters were well shown. Table decorations both of garden flowers and of wild flowers were very good, in the one class Miss Phippen was 1st, in the other Mrs. Adwain, Messrs. Phippen & Robinson had a charming bridal bouquet, a long way in advance of any other; and the basket of sweet scented flowers arranged by Miss Phippen was an excellent performance.

The blue riband of the fruit prizes was the handsome silver cup given by Messrs. Sutton & Son, for the best collection of eight dishes of fruit; and there having been three good money prizes also, a good competition ensued. The best came from Mr. C. Howe, gr. to Sir Richard Sutton, Bart., Benham Park, who had a fine lot, including Black Hamburg and White Muscat Grapes, Pine, Melon, Peaches, Nectarines, Pears, and Figs. Mr. Austen had some remarkably fine Noblesse Peaches, and a collection only just second in point of merit. The best collection of four dishes came from Mr. J. C. Higgs, Caversham Park, who had black and white Grapes, Melon, very fine Barrington Peaches, capital Moor Park Apricots, and Elruge Nectarines. The best four dishes of fruit grown in the open air came from Mr. J. S. Bellis, gr. to Major Thoys, Sulhamstead House, Reading.

The show of Grapes was both extensive and excellent. The three bunches of Black Hamburgs from Mr. J. Ashby, gr. to W. Fanning, Esq., were perfect examples of high-class culture. In the class for three bunches of black Grapes other than Hamburgs, Mr. Atkins was to the fore with some superb examples of Madresfield Court. In the class for three bunches of white Muscats, Mr. P. Feist was 1st, with well finished bunches. With any other variety of white Grape Mr. J. Wells, gr. to R. Ravenhill, Esq., Winkfield, had some very fine examples of Buckland Sweet-water. Peaches were numerous and fine; the best dish was Barrington, from Mr. J. C. Higgs, and wonderful fruits they were. Nectarines were good, so were Apricots, and Melons were in plenty. The best three dishes of Plums came from Mr. A. Bridgeman, gr. to T. S. Cocks, Esq., Marlow, and consisted of Washington, Kirke's, and Green Gage. Apples were plentiful and good. Vegetables were numerous and very good, but space will not admit of particulars being furnished. (From a Correspondent.)

Henley-on-Thames Horticultural: August 29.—The annual show of the Society was held in connection with a show of poultry, &c., on a meadow adjoining the town. As usual at this place, there was a good display of stove and greenhouse plants, also Ferns, Lycopods, and foliaged plants. For six stove and greenhouse plants Mr. Smith, gr. to C. Lane, Esq., was 1st, 2d honours going to Mr. Good, gr. to the Right Hon. W. H. Smith, Greenlands. The 1st prize lot contained nice young plants of *Dipladenia amabilis* and splendens in fine health and well-flowered; also *Ixora Williamsii*, *Clerodendron falax*, *Anthurium Scherzerianum*, and an *Ocimum*. In Mr. Good's collection was the old *Rondeletia speciosa*, *Phenacoma Barnesii*, *Cassia corymbosa*, &c., all well-grown plants. The same exhibitor stood 1st with eight fine-foliaged plants. In this group *Croton Weismanni*, *Cyanophyllum magnificum*, and *Acalypha Wilkesiana*, were conspicuous; he also took a 1st prize for a single specimen plant of *Ixora Williamsii*, the 2d prize going to a *Dipladenia splendens*. Fuchsias were fairly shown, as were Cockcombs and Balsams. Zonal and variegated *Pelargoniums* combined made a good display, Mr. Smith, gr. to C. Law, Esq., being 1st with six of Dr. Denny's varieties. Mr. Good contributed a nice group of Ferns, which took 1st honours, and included a fine plant of *Gymnogramma peruvianum*; six very good specimens of *Lycopodiums* were also staged by the same exhibitor. In the fruit classes belonging to this section were some small but nicely finished Black Hamburg Grapes: 1st, Mr. Neville; 2d, Mr. Rixon, gr. to J. Cooper, Esq. For other black kinds Mr. Good was the only exhibitor, and had the 1st prize with three nice bunches of Madresfield Court, which just required the finishing stroke in colour to make them perfect examples of this fine Grape. A dish of Muscats from Mr. Reeves, an amateur, was a highly creditable production, and as such deserved the 1st prize. Very good Peaches were shown by Mr. Neville and Mr. Good; the first had a splendid dish of Grosse Mignonne, and the latter grower was 1st with a dish of Elruge Nectarines in that class. Excepting Morello Cherries and culinary Apples the supply of hardy fruit was, as might be expected this year, confined to a few dishes of each sort. Vegetables were good, but not plentifully shown. The keenest competition in this way was in the collections of nine dishes of distinct kinds—Mr. Neville, gr. to W. Vidler, Esq., coming in 1st with excellent Celery, Peas, French Beans, &c. In the open class Celery, Cucumbers, and Onions were particularly good, Snowflake Potatoes taking the premier prize for kidneys and Paterson's Victoria in the round sorts.

In the section devoted to amateur growers the

1st prize lot for four varieties comprised *Vallota purpurea*, *Plumbago capensis*, *Balsam*, and a *Sedum*. Other exhibits—scarlet and variegated *Pelargoniums*, *Balsams*, &c.—were fairly good, as was the cut flowers of Dahlias, Roses, Asters, and Zinnias, *Verbenas* being very poor. The Grapes in this section were about an average quality; Melons poor; Peaches fair; one dish of good Orleans Plums; no Figs or Pears, and but few dessert Apples. Amongst vegetables we noticed good Snowflake and Victoria Potatoes, both taking the leading position in their respective classes; fine Onions and Peas, Laxton's Quality being 1st. For collections of vegetables Mr. Tranter was 1st, and Mr. Mortlock 2d.

In the cottagers' tent a very creditable lot of vegetables appeared, many of the dishes being nearly equal in point of merit when compared with the gentlemen's gardeners. The front of the stage in this tent was filled, in a very effective way, with a miscellaneous collection of plants, including Fuchsias, Zonal *Pelargoniums*, Coleus, &c., which were interspersed with Maidenhair Ferns and cut flowers of Gladioli, Zinnias, Asters, &c., by Mr. Jones, nurseryman, of Henley-on-Thames. A very interesting collection of wild flowers was sent by the Park Place Gardens Botanic Class, held in connection with the Science and Art Department, South Kensington, comprising 228 species, all these being obtained from the immediate locality. A group of young Palms, including some of the best varieties in cultivation, in fine condition, was sent from the gardens of the Right Hon. W. H. Smith, Greenlands. *Observer*.

Isle of Thanet Horticultural: August 29.—The twelve miscellaneous stove and greenhouse plants exhibited by Mr. F. Miller, gr. to Mr. Friend, and which were awarded the 1st prize, were particularly good, as were also the twenty-four miscellaneous, arranged for effect, the first in which was taken by Mr. T. Godfrey, gr. to Mrs. Jolliffe. For six exotic Ferns Mr. Jarman was fortunate, and deservedly so; we could not help noticing two particularly good ones amongst his collection—a small *Adiantum gracillimum* and a *Lastrea* called elegans. The next in order of merit, those shown by Mr. Godfrey, gr. to Mrs. Jolliffe, were also much admired. There was a good show of Begonias and Petunias. Of *Pelargoniums* there was a first-class show, the golden and silver tricolor and bronze being a capital competition. Among the cut flowers the Dahlias were good, those shown by Mr. Miller and taking 1st prize being very fine. Marigolds and Hollyhocks were a passable show. In this tent the most noticeable stand was that of Messrs. Kinmont & Kidd, of Canterbury. There were a couple of boxes of Dahlias, but the great feature of the stand was the collection of Roses, their *Maréchal Niels* being superb; indeed their show of Roses was really splendid. The Roses for competition, though they in no way approached in excellence to the above, were very good for the time of year, Mr. C. Howard carrying away the 1st prize. Another stand worthy of mention was that of Mr. H. Cannell, nurseryman, of Swanley, his *Pelargoniums* being especially good.

Coming to the fruit, the Grapes were exceedingly fine, three bunches of Muscat of Alexandria shown by Mr. W. Jarman averaging, we should think, 4 lb. a bunch; the berries were very large and the colour excellent. Mr. Jarman also exhibited the heaviest bunch, which weighed 5½ lb. There was a capital show of Figs, and the Melons were better than last year, both the scarlet and green-fleshed ones being very fair specimens. There was a bouquet of exotics, by Miss Kinmont, not for competition, with a decoration for the table, worthy of special mention, and the only regret appeared to be that Miss Kinmont had not exhibited for prizes.

Of vegetables there was an excellent competition. The cottagers' productions were also very good this year. The Potatoes, Onions, &c., were first-class, it being remarked that in many instances they were superior to the professional gardeners' vegetables. (From "Kebble's Gazette.")

Preston Horticultural: August 29 and 30.—This Society held its annual exhibition on the above date in the spacious glass-covered area of the Corn Exchange. The weather in the north of the kingdom has been such this summer (with rain almost every day since the beginning of July) that many of the productions, especially flowering plants, have upset the calculations of the growers, not being sufficiently in bloom at the time they were intended for, hence the more limited competition in some of the classes.

Collection of thirty plants in 12-inch pots (nurserymen only).—1st, the Preston Nursery Co., showing a beautiful lot of mixed flowering and foliage plants, amongst which were nice examples of *Erica Maroccaniana*, *E. insignis*, *E. Fairriana*, *E. Aitoniana*, *Turnbullii*, the white *Lapageria*, *Phenacoma prolifera*, and the singular and seldom-seen *Gloriosa superba*; *Encephalartos cycadifolius*, *Dion edule*, *Cocos Weddelliana*, *Kentia Canterburyana*, and splendidly

coloured young specimens of *Croton Weismanni* and *C. majesticus*. The whole were in a free-growing condition, and in no ways stunted, as the groups restricted to size of pot are often met with.

In the twelve miscellaneous plants there was a close and spirited competition, Mr. Newton, gr. to W. Birley, Esq., being 1st with an even well-matched group, conspicuous in which was *Allamanda nobilis*, *Ixora coccinea*, *Bougainvillea glabra*, and *Crotons undulatus* and variegatus. Mr. Williams, gr. to Colonel Birchall, was a close 2d, stronger than 1st; opponent in foliage-plants, but weaker in blooming subjects. He had the rarely-met-with pretty white flowered *Abelia rupestris*, *Vallota purpurea*, a fine *Agave schidigera*, *Dracaena Draco*, *Phoenix reclinata*, and *Cycas revoluta*.

Six stove and greenhouse plants, three in flower and three foliage.—Here the competition was so close betwixt Mr. Newton and Mr. Leayell that equal 1sts were awarded them. The best plants in Mr. Leayell's exhibit were *Lapageria alba*, *Erica Maroccaniana*, and *Maranta Veitchii*, Mr. Newton had *Allamanda grandiflora*, *Bougainvillea glabra*, and *Latania borbonica* in very nice condition.

Three ornamental foliage plants.—In this class Mr. Leayell deservedly took first honours, showing one of the finest examples of the *Venus Fly-trap* (*Dionaea muscipula*) we have ever seen, in a pan 1½ inches across, a dense mass of healthy traps, individually large and of the peculiar bronzy tinge this strange plant is sometimes seen in. This collection also contained a nice young plant of *Nepenthes Rafflesiana*.

Adiantums were well represented. For three Mr. Leayell took the lead, Mr. Williams being a very close 2d; Mr. Newton and J. Harding, Esq., equal 3d.

Six dinner-table plants.—These were well shown. In a near competition Mr. Newton was 1st with plants just right in size, not too big or too massive; 2d, J. C. Stevenson, Esq.; 3d, J. Hardiog, Esq.

Mr. Thornber, gr. to T. M. Sbuttleworth, Esq., exhibited, not for competition, a splendid group of fine-foliage plants, comprising grand examples of Palms, amongst which noticeable were *Areca Verschaffeltii*, *Chamærops humilis*, and *Cocos Weddelliana*, an immense specimen; *Dion edule*, *Phormium Colensoi variegata*, a beautifully-grown *Dasylirotin gracile*, *Dicksonia antarctica*, *Vriezia reticulata*, immense plants of *Adiantum glaucophyllum*, *A. tenerum*, and *A. trapeziforme*, from 4 to 5 feet across, and a very large example of the Fern-like *Paullinia thalictrifolia*.

The Preston Nursery Company also showed a group to which the 1st extra prize was deservedly awarded, in which was probably the best example of *Lapageria rosea*, trained as a pot specimen, ever produced—4½ feet through, and as much in height, completely clothed with its beautiful bell-shaped blossoms; and well-flowered examples of the Willow-leaved *Ixora* (*I. salicifolia*), *Allamanda Hendersonii*, *Phenacoma prolifera*, and a well-coloured *Bougainvillea glabra*, intermixed with tall Tree Ferns, Palms, *Dracenas*, and *Crotons*—altogether a well-grown, effective lot. The Company likewise had a large collection of new and rare plants, occupying a long table. Messrs. T. Hodson & Son, nurserymen, Preston, exhibited a very nice selection of flowering and fine-leaved plants, furnished window-boxes, garden appliances, &c., which received an extra prize.

Fruit from under glass was exhibited in moderate quantities; the extreme wet experienced in this part has been very much against outdoor fruits. Collection of six dishes.—1st, Mr. J. Myerscough. Two bunches black Grapes.—1st, Mr. Loose, gr. to Lord Wimmarleigh, having beautiful bunches of Madresfield Court, well finished in every respect; 2d, Mr. Meehan, gr. to J. Brown, Esq., with Black Hamburgs; 3d, Mr. J. Myerscough. Two bunches white Grapes.—1st, Mr. Loose, showing good examples of Muscat of Alexandria, even in berry and nicely coloured; 2d, Col. Cross; 3d, Mr. Meehan. Mr. Loose had a beautiful bunch of Black Hamburg Grapes, 11½ lb. in weight, finely swelled berries, compact, and the best finished generally we have seen for so large a bunch of this variety. (From a Correspondent.)

Dundee Horticultural: August 30.—Many flowers, such as Gladioli, are weeks behind in flowering, while Hollyhocks are rotted by the rains. Asters, Pansies, and Marigolds are in wretched condition, while herbaceous blooms generally present a draggled appearance. Nevertheless, the exhibition was in every way good. In the competition for stove or greenhouse plants Mr. James Wilson, gr. to Mr. George A. Cox, Beechwood, gained the 1st prize. Next in conspicuous position were the exhibits and prizes gained by the local nurserymen, to whom the Society is greatly indebted for their readiness in coming forward to sustain the shows by their valuable collections. Messrs. John Stewart & Sons were successful in carrying off a large share of the prizes, obtaining 1sts for Ferns, *Pelargoniums*, hardy shrubs, Roses, and bouquets. Messrs. Laird & Sinclair were successful in taking 1st honours for a group of stove

and greenhouse plants, for plants for table decoration, for Pelargoniums in flower, for alpine plants, also prizes in various other classes open to nurserymen. Messrs. D. & W. Croll had for exhibition a collection of stove and greenhouse plants, which contained compact, well-grown specimens of the leading varieties, also Pelargoniums in flower, variegated-leaved Pelargoniums, exotic Ferns, alpinæ, and table plants, &c. For two pots of *Lilium speciosum* the 1st prize was awarded to Mr. James Low, Maryfield. In scarlet Pelargoniums there were three competing gardeners: the 1st prize fell to Mr. W. Alison, gr. to Mr. J. F. Low, Seaview, Monifieth. Mr. David Middleton was 1st for six exotic Ferns. Some 165 pots of alpinæ were shown, Mr. Andrew Pattison, of the Baxter Park, came to the front with the best thirty. It is pleasant to find the old-fashioned "Heather-reenge" (*Hydrangea*) of our grandmothers encouraged in the present show, and Mr. A. J. Warden gained the 1st prize for a specimen with thirteen heads of the colour and shade the ancient matrons of the Glamis district delighted in. Mr. David Mitchell, gr. to Mr. G. B. Simpson, who has won prizes without fail at the Dundee shows for fifty-one years, has gained a 2d prize for twelve succulents, and thus completed his fifty-second prize year. Mr. Peter Barron, the well-known railway porter, has again won laurels among the Ferns—two 1st prizes in Ferns, and a 1st in Lycopods. Mr. John Hampton, Newport, took 1st prize for twelve Pentstemons, also 1st for twelve Phloxes and for twelve herbaceous blooms. Mr. John Macpherson, Polmuir, who carried the 1st prize for best eighteen Dahlias, showed a beautiful collection. Alexander Westland, Raemoir House, Banchory, had a number of bright and shapely gems in his twelve, for which he carried a 1st prize.

Councillor Moncur successfully sustained his high position among the Grape-growers, having been awarded no less than four 1st prizes. For the eight varieties of fruit (Pine-apple excluded) Mr. John Macdonald, gr. to Mr. James Paterson of Kinnettles, was 1st. Mr. Reid (Councillor Moncur) gained the 1st prize with four large, compact bunches, consisting of Lady Downes, Mrs. Pince, Muscat of Alexandria, and Muscat Hamburg. Mr. Jas. M'Connochie, gr. to Mr. G. A. Smollett, won the 2d prize with excellent bunches of Black Alicante, West's St. Peter's, Lady Downes, and Muscat of Alexandria. Mr. John M'Donald, gr. to Mr. James Paterson, won the 1st prize for heaviest bunch of Grapes with a Raisin de Calabre weighing 6 lb. 2 oz. There were no less than eight competitors for the one bunch of Black Hamburg prizes, Mr. Wm. Watson taking the premier award.

In the vegetable department a good deal of interest was taken in the competition among gardeners for the best basket of vegetables. The 1st was won by Mr. Peter M'Arthur, gr. to Mr. John Leng, Kinbrae. *Dundee Advertiser.*

Bishop Auckland Horticultural: August 31.—The great floral carnival of the North of England was held under circumstances of the most depressing character. A thorough wet morning—not a steady mild rainfall, but a merciless downpour, characterised the opening hours of the morning, and the staging and judging had to be done amid surroundings of cold and wet, darkness and mud, that were sadly out of harmony with a floral show. To a society depending solely on the gate money to meet the expenses of the day the unpropitious weather would have brought absolute ruin; and yet, despite the falling rain and mud, it was marvellous to witness how many persons were present. The tents were as much thronged as ever, but the immense throng that gathers round the band stand during the afternoon was considerably lessened in numbers. When the weather is fine at Bishop Auckland the popular assemblage is one of the sights that powerfully impresses the mind. The disc of scarlet-coated musicians, surrounded by an immense crowd of a hundred or more in depth, hushed to stillness in order that those on the remote circumference may catch the softest music—then a belt of trees, and above and beyond these on two sides the hills literally swarming with human beings, and the white tents containing the plants group in a charming dell hard by. The show of stove and greenhouse plants was considered to have been one of the best ever held at Bishop Auckland. They were numerous and good. On the other hand there was a marked falling off in fruit, and in such cut flowers as Dahlias, Hollyhocks, and Roses, owing to the wet, sunless season; but in all other respects the show, if anything, excelled what has gone before.

STOVE AND GREENHOUSE PLANTS.—There were six collections of six stove and greenhouse plants, the prizes being £10, £7, £4, £2, and £1. The best group—and the plants were all remarkably good—came from Mr. E. Tudgey, gr. to H. F. Williams, Esq., Ilenwick Grange, Worcester, who had *Allamanda nobilis*, *Anthurium Scherzerianum*, *Clerodendron Balfourii*, very fine; *Erica eximia superba*, *Statice profusa*, and *Ixora coccinea*. 2d, Messrs. E. Cole &

Son, Withington, Manchester, with *Allamanda nobilis*, *A. Hendersonii*, *Ixora coccinea superba*, *Statice profusa*, *Erica Marnockiana*, and *Bougainvillea glabra*. 3d, Mr. Thomas Wilson, Normanton Hall, Middlesbrough, with *Dipladenia amabilis*, very fine; *Stephanotis floribunda*, *Ixora javanica*, *Lapageria rosea*, *Erica obtata purpurea*, and *Allamanda Hendersonii*. Mr. Wilson had the best three plants in *Phœnocomma prolifera*, *Barnesi*, and *Erica aristata*; 2d, Mr. E. Letts, the gardens, Upleatham, with *Bougainvillea glabra*, *Stephanotis floribunda*, and *Ixora coccinea*.

There were also groups of twelve stove and greenhouse plants, handsome foliaged plants or Ferns confined to 14-inch pots, but, while they materially helped the show, they contained nothing calling for special remark. Indeed, in the case of a large show like this, it is extremely difficult to pick up all the details even if it were expedient to do so, and only the leading features can be referred to. The best exotic Ferns came from Mr. R. Westcott, the gardens, Raby Castle, who had *Todea superba*, very fine, *Davallia Mooreana* in splendid condition, *Cyathea dealbata*, *Davallia polyantha*, *Gleichenia flabellata*, and *Dicksonia squarrosa*. The prize card had been knocked off the 2d prize group, but they were all well-grown plants. British Ferns were well grown, and contained some choice things, and the six Lycopods staged by Mr. John Short, Darlington, were remarkably good.

On the opposite side to the stove and greenhouse plants in the large plant tent the groups of six FINE-FOLIAGED PLANTS were staged, and a grand bank they formed. Messrs. E. Cole & Sons, Withington, Manchester, were placed 1st, with a huge *Latania borbonica*, *Croton Johannis*, *C. angustifolius*, *Geonoma Schottiana*, a splendid *Cycas revoluta*, and *Pritchardia pacifica*, not in the best condition. 2d, Mr. S. Lazenby, Woodside, Darlington, with *Phoenix reclinata*, *Cocos Weddelliana*, *Croton majesticus*, *Croton Weismanni*, *Cycas revoluta*, and *Dasyllirion gracile*; 3d, Mr. James Noble, Woodburn, with a fine *Ficus Parcelli*, *Croton Johannis*, *Croton interruptus*, *Dasyllirion seratifolium*, and *Corypha australis*; the 4th prize group, staged by Mr. N. Black, gr. to the Misses Pease, Southend, Darlington, containing small but such remarkably well-grown plants, as to deserve mention—the specimens were superbly finished, they only wanted bulk to have attained a higher place: they were *Maranta rosea picta*, very fine; *M. Makoyana*, beautifully grown; *Croton Weismanni*, *Cocos Weddelliana*, *Pandanus Veitchii*, and *Dæmonorops plumosus*. It would be as well if, at a large show like that at Bishop Auckland, there could be a class for fine-foliaged plants restricted to a certain size, so as to admit of a fine group like that of Mr. Black's taking a higher position. Small plants, however well furnished, stand but a poor chance against much larger specimens of less attractive forms, so long as they are well developed.

The three best ORCHIDS came from Mr. Levi Hartley, Etherley, and consisted of *Oncidium macranthum*, *O. Reichenbachianum* (?), and *Masdevallia Lindeii*. Cockscombs were good. There were small but nicely-grown bushes of *Coleus*; *Achimeeas* were well done; and the six Zonal Pelargoniums staged by Mr. C. Hockney, Stocksley, were all that could be desired, being good exhibition varieties, nicely grown and flowered.

Turning to the CUT FLOWER classes, it may be stated that, though remarkably good prizes were offered for Roses, the hoped-for feature of a thoroughly good autumn Rose show was not forthcoming. It was thought that five prizes of £10, £7, £5, £3, and £2, for twenty-four cut Roses, three trusses of each, would have tempted the Southern growers, like Mr. C. Turner, Mr. George Paul, and others, to have gone northwards; but this expectation was not realised. Probably these large prizes will be abandoned another year. Mr. John Harrison, Catterick Bridge, was 1st with some very good flowers, the weather in the North considered. The 2d, 3d, and 4th prizes were withheld, the 5th going to Mr. W. Jackson, Blakedown, Kidderminster. Miss Robinson had the best twelve Roses; the best twenty-four in single blooms came from Mr. Harrison, but the 1st prize was withheld in this class. In the class for twelve yellow Roses, *Gloire de Dijon* and *Marie Van Houtte* were shown.

Dahlias fell much below their usual mark at Bishop Auckland. The best twenty-four dissimilar blooms came from Mr. W. Jackson, Blakedown, Kidderminster, who had *Henry Walton*, *Charles Leicester*, *Lady G. Herbert*, *Drake Lewis*, *Hugh Miller*, *Vice President*, *Monarch*, *Ovid*, *Mr. Seaman*, a new northern flower, pale green tipped with lake; *Thomas White*, *Willie Eckford*, *Charles Backhouse*, *Criterion*, *Chancellor*, &c. 2d, Mr. H. Clarke, Rodley, whose best flowers were *Charles Leicester*, *Cremorne*, *J. N. Keynes*, *Mrs. Harris*, *Henry Walton*, *Acme of Perfection*, *Leah*, *John Standish*, *Flora Wyatt*, and *Mr. Stancomb*. In the amateurs' class for twelve Dahlias, Mr. John Walker, Lonfella, was 1st, his best blooms being *Delicata*, *Flora Wyatt*, *Vice-President*,

James Cocker, *Henry Walton*, *J. N. Keynes*, *Prince Arthur*, *Viçette*, *Willie Keynes*, and *Mrs. Eckford*. 2d, Mr. John Alderson, Calverley, Leeds, with *Vice-President*, *J. N. Keynes*, *Flora Wyatt*, *John Standish*, *Charles Leicester*, *Miss Henshaw*, *Chancellor*. With twelve fancy Dahlias, Messrs. Edwards & Son, Nottingham, were 1st, having *Eccentric*, *Miss Anna*, *William Glass*, *Fanny Sturt*, *Mrs. Saunders*, *Flora Wyatt*, *Countess de Beater*, *Parrot*, and *Sparkler*, as the best blooms. 2d, Mr. H. Clark, Rodley, with *Mrs. Saunders*, *Parrot*, *Miss Nelly Large*, *J. B. Camm*, *Flora Wyatt*, and *Henry Glasscock*.

Gladioli, generally so fine at Bishop Auckland, fell far short of their usual quality, owing to the wet, sunless season. The best nine spikes came from W. Spoor, Gateshead; 2d, W. Jackson, Kidderminster. The best seven spikes—a most awkward number to stage effectively—were shown by Mr. W. Slater, Plowsworth; 2d, Mr. George Hankin, Wolverton. Cut flowers of herbaceous plants were remarkably well shown, but as the stands included *Yucca gloriosa* and things of a similar character, it was seen that a wide interpretation had been given to the class. *Asters*, *African* and *French Marigolds*, were very good, the latter showing the fine florists' character, of which but little is known in the South.

The show of FRUIT fell far short of its usual character. The gardeners present stated that the season had been dead against them. The best eight dishes of fruit, Pines excluded, came from Mr. R. Westcott, The Gardens, Raby Castle, who had *Golden Champion* and *Golden Queen Grapes*, both good; *Eastnor Castle Melon*, *Royal George Peaches*, *Albert Victor Nectarine*, *Reine Claude de Bvay Plum*, *Moor Park Apricot*, and *Figs*; 2d, Mr. W. Wallis, with *Black Hamburg* and *Muscat of Alexandria Grapes*, very fine *Royal George Peaches*, *Nectarines*, *Apricots*, *Figs*, *Queen Emma Melon*, and *Plums*; 3d, Mr. T. R. Jowsey. Mr. Westcott also had the best six bunches of Grapes, which included *Golden Queen*, *Waltham Cross*, *Golden Champion*, very well finished; *Black Hamburg*, *Muscat Hamburg*, and *Black Alicante*—a very good lot; 2d, Mr. T. R. Jowsey, with *Trebbiano*, *Muscat of Alexandria*, *Bowdoin Muscat*, *Barbarossa*, *Black Hamburg*, and *Foster's Seedling*. The best two bunches of *Black Hamburg* came from Mr. W. Larkur, Bishop Auckland; Mr. Thomas Aitken being 2d. In the class for two bunches of black Grapes, not Hamburgs, Mr. R. Westcott was 1st, with *Black Alicante* and *Barbarossa*, both of which had been worked on the *Black Hamburg*, and were finely finished; 2d, Mr. T. R. Jowsey, with *Barbarossa*; 3d, Mr. E. Lazenby, Darlington, with *Black Prince*. Mr. R. Westcott had the best two bunches of *White Muscat*, Mr. T. R. Jowsey being 2d. Mr. N. Black, Darlington, had the best two bunches of white Grapes, not *Muscat*, in well-finished examples of *Golden Hamburg*; 2d, Mr. J. Burrows, Catterick, with *White Frontignan*, *Foster's Seedling* and *Syrian* were also shown in this class. *Peaches* were fairly well represented, Mr. Wallis coming in 1st with some very good *Royal George Nectarines*; *Cherries*, *Melons*, and *hardy fruits* were good, but not large in quantity.

The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, SEPT. 5, 1877.

Aug. 30.—Fine and bright till noon. Dull and showery till 4 P.M. Fine and clear after.
 31.—A fine bright day, partially cloudy. Few slight showers of rain in morning.
 Sept. 1.—A very fine bright day. Partially cloudy.
 2.—A very fine day. Smart shower of rain at 4.30 P.M.
 3.—Overcast, dull, wet and cold throughout.
 4.—A fine bright day. Cloudy at times. Cold.
 5.—A very fine bright day, cloudless at night.

LONDON: *Barometer*.—During the week ending Saturday, September 1, in the neighbourhood of London the reading of the barometer at the level of the sea increased from 29.53 inches at the beginning of the week to 29.97 inches by the evening of August 26, decreased to 29.70 inches by the afternoon of the 28th, increased to 30.01 inches by mid-day on the 29th, decreased to 29.84 inches by the afternoon of the 30th, increased to 30.12 inches by the morning of September 1, and was 30.07 at the end of the week. The mean reading for the week at sea level was 29.90 inches, being 0.06 inch above that of the preceding week, and 0.16 inch below the average.

Temperature.—The highest temperatures of the air observed by day varied from 72° on August 29, to 66° on September 1; the mean for the week was 68½°. The lowest temperatures of the air observed by night ranged from 44° on September 1 to 59½° on August 26; the mean value for the week was 53½°. The mean daily range of temperature in the week was 14½°, the greatest range in the day being 22° on September 1, and the least 7°, on August 26.

The mean daily temperatures of the air, and the departures from their respective averages, were as follows:—August 26th, 61°·1, + 0°·7; 27th, 61°·6, + 1°·3; 28th, 62°·4, + 2°·2; 29th, 62°, + 1°·9; 30th, 59°·5, - 2°·5; 31st, 57°, - 2°·8; September 1st, 53°·6, - 5°·8. The mean temperature of the air for the week was 59°·3, being 0°·7 below the average of sixty years.

The highest readings of a thermometer with blackened bulb in vacuo, placed in sun's rays, were 131° on the 29th of August, 130° on the 31st, and 126½° on the 28th, but on the 27th the reading did not rise above 84°. The lowest readings of a thermometer on grass, with its bulb exposed to the sky, were 36° on September 1, and 43½° on August 31. The mean of the seven low readings was 49°.

Wind.—The direction of the wind was W.S.W., and its strength brisk.

The weather during the week was changeable, although very fine at intervals.

Rain fell on five days during the week; the amount collected was 0.45 inch.

ENGLAND: *Temperature*.—The highest temperatures of the air observed by day were 76° at Sunderland, 72° at Blackheath, and 71° both at Norwich and Nottingham; the highest temperature at Portsmouth, Liverpool, and Bradford was 66½°; the mean value for the week from all stations was 69°. The lowest temperatures of the air observed by night were 39½° at Nottingham and Eccles, 41° at Bristol, and 41½° at Wolverhampton; the lowest temperature at Portsmouth was 49°, and at Plymouth 48½°; the general mean from all stations was 44½°. The range of temperature was the greatest at Nottingham, 31½°, and the least at Portsmouth, 17½°; the mean range of temperature from all stations was 25°.

The mean of the seven high day temperatures was the highest at Blackheath, 68½°, and Norwich, 67½°; and the lowest at Liverpool, 62°. The mean from all stations was 65°. The mean of the seven low night temperatures was the lowest at Eccles, 48°; and the highest at Portsmouth, 56½°; the mean value from all stations was 52½°. The mean daily range of temperature was the least at Portsmouth, 8½°; and the greatest at Nottingham, 17½°; the mean daily range from all stations was 13°.

The mean temperature of the air for the week from all stations was 57½°, being 2° higher than the value for the corresponding week in 1876. The highest was 59½° at Blackheath and Brighton, and the lowest 54°, at Eccles.

Rain fell on every day in the week at Truro, Bristol, and Bradford, and five and six days at most other places. The amounts varied from 2½ inches nearly at Bristol, and 2½ inches at Plymouth, to half an inch at Blackheath; the average fall over the country was 1½ inch.

The weather during the week was generally dull, and the sky cloudy, but fine weather prevailed at intervals. A thunderstorm occurred at Hull on August 31, and lightning was seen at Liverpool on September 1.

SCOTLAND: *Temperature*.—The highest temperatures of the air varied from 70° at Paisley to 60½° at Glasgow and Aberdeen; the mean value from all stations was 63½°. The lowest temperatures of the air ranged from 42° at Edinburgh and Paisley to 44½° at Glasgow; the mean from all stations was 43°. The mean range of temperature in the week from all stations was 20½°.

The mean temperature of the air for the week from all stations was 53½°, being ½° lower than the value for the corresponding week in 1876. The highest was 54½°, at both Glasgow and Greenock, and the lowest 52½°, at Aberdeen.

Rain fell at Greenock to the amount of 2½ inches, at Paisley 2½ inches fell, at Dundee 2½ inches fell, whilst at Leith 1½ inch was measured. The average fall over the country was 2 inches.

DUBLIN.—The highest temperature of the air was 70½°, the lowest was 38°, the range was 32½°, the mean was 55½°, and the fall of rain was 0.58 inch.

JAMES GLAISHER.

Variorum.

APPLE CULTIVATION IN CANADA.—This, after all said and done, is the standby of Canadian fruit culture. No fruit product is more important in a sanitary and pecuniary aspect than this. None is so common, and can be so generally cultivated by all. The cultivation of small fruits is important, and making rapid strides among us as fruit growers, but all other fruit culture must yield to that of the Apple. Even Pears, I am sorry to say, must give way to the value of the Apple. It would be curious to know what is the annual production of Apples throughout the country. Statistics on this head would be invaluable. There is no means, however, of knowing, and on such a subject guessing is in vain. The amount must be something enormous, and yet it is far below what it should be. There are large districts highly susceptible of fruit raising that are barren of any fruit product. It sometimes startles one to see the lop-sided, decaying fruit trees that stand, like some deserted home, around the poor and ill-conditioned homesteads of a class of our Canadian farmers. Such men are not aware of the abundant and efficient means of health they are squandering in allowing such a state of things to exist on their farms. No addition to the farmers' table is more wholesome than the Apple. No product he raises so easily brings a return to the family income. An obstacle to Apple raising is often presented to me, and consists of the following assertion:—"That attention to the orchard comes at the very time when the farm demands the most care and toil." Now the difficulty is imaginary. Pruning may be done in the fall, when the land is too wet for ploughing. Trees can be cared for in early spring, in February and March, when other farm labour is mostly in abeyance. Two irons in the fire at the same time, of course, require attention. They can both be attended to. Again, it is asked, what are the varieties to be planted? The answer is ready; plant few, and let these be good varieties. It may be questioned by some that your President is able to give such directions as will lead to beneficial results on these heads. If the Apple be planted for profit, then I would say the fewer varieties planted the better. We can confidently recommend the Roxbury Russet, the Russet of Western New York, the Rhode Island Greening, and Northern Spy. We would like to add the Golden Russet to these, and our profitable winter list would be complete. A great advantage is to be gained in selling when few varieties are cultivated. Buyers like the sorts to be homogeneous—all Roxbury Russets—all Rhode Island Greenings—all Northern Spys. As a matter of course, the above list must be modified according to locality and aspect. Such a list, however, would afford a farmer fruit during a large portion of the year, as it is easy in almost every quarter to supplement his own supply from the earlier varieties cultivated by his neighbours. From the President's Address to the Fruit Growers of Ontario.

A GARDEN WITHOUT A GOOSEBERRY.—Gooseberry tarts might "gnaw a file," to say nothing of eating off the little enamel left on the snaggy remnants of any decayed dentine. This fruit grows thriftily, bears profusely, is entirely hardy, but to the palate is as concentrated vinegar. Beautiful in pictures, grand on exhibition, profitable to the nurserymen, valuable to the boarding-house keeper, but the most unsavoury morsel that enters one's mouth. A man with a single healthy Gooseberry bush (and who ever saw one that was not healthy?) had better lay in a stock of sugar, for in no manner of "putting up" will less than three parts of sugar to one of Gooseberries suffice. A humble friend of mine, fresh from the "old sod," used to indulge in the most grandiloquent tales about these self-same Gooseberries. "In the old country they wur as big as your fist, zur," and "they jist milt in your mouth like dew." Shortly after I had the pleasure of testing this fruit for myself, and I must acknowledge that I was surprised to find it occasionally palatable, although very far from the nectar and ambrosia that some writers describe. I shall not forget my first look in the celebrated Covent Garden Market, London, on the tempting array of Gooseberries in the height of the season, but the Crown Bobs, luscious-looking fellows, proved flavourless; the Queen of Sheba's sour as a red Dutch Currant; the Jolly Anglers, tasteless as the latest novelty in French Pears; and Roaring Lion insipid. I was told that was an exceptionally poor season for the Gooseberry. As every season throughout my life had been a poor one (for flavour) for Gooseberries at home I accepted the apology.—*Cropper, in the "New York Tribune."*

Enquiries.

He that questioneth much shall learn much.—BACON.

203. CISALPINE STRAWBERRY.—Where can I procure runners or seeds of this variety, mentioned by William Cobbett in his *English Gardener*? J. E. Daniel, 6, The Terrace, Epsom.

Answers to Correspondents.

ARAUCARIA IMBRICATA: W. S. It is not "very" rare to see this tree producing cones, and as time goes on it will probably be even more common. What is the shape of the cones, on your tree? If globular they are females, if elongated they are male spikes.

ARGYREIA CYNOSA: W. K. An East Indian creeper, much resembling an Ipomoea, and should be treated as such. Sow at once in light rich soil.

BOOKS: D. P. We do not know of any such book as you ask for.

CINERARIAS: C. G. If your plants have not been kept too wet at the roots, the cause of damping off must be that they have been kept too close—want of air.

CUCUMBERS: E. C. Your Cucumber leaves appear to be caught by the sun after having been sprinkled. There is no indication of disease.

CUTTING SHRUBS: *Old Subscriber*. We cannot at this distance estimate the value of your loss, and recommend you to get some competent person near at hand, and who will be able to see the disfigurement, to advise you on the matter.

FUCHSIA LEAVES DAMAGED: L. H. The leaves seem to have been grown in a hot, dry atmosphere, and to be literally stewed. Try if more moisture will not improve them. Put the Cinerarias into a cold pit.

GARDENERS' BENEFITS: J. P. We do not think your scheme would work well, and, unless greatly modified, would be open to much objection.

GREEN BEDDING PLANT: T. P. What you send is the common Peppermint—a very different plant to the Mentha Pulegium gibraltarium used at Cleveland House and elsewhere.

INSECT: J. E. A sawfly called *Sirex gigas*, which bores into timber and woodwork, and deposits its eggs therein. Did you find the insect near growing or near

FIG. 65.—SIREX GIGAS.

dead timber? The long sting-like process is the ovipositor. The insect has much of the appearance of a hornet, but has no power of stinging.

NAMES OF FRUITS: W. T. Probably some species of *Attalea*, like the *Coquilla* nuts.

NAMES OF PLANTS: E. C. D. We believe your plant to be a white variety of *Erythraea pulchella*, which is itself, to our thinking, but a variety of *E. Centaureum*, which we have more than once found white near Folkestone.—J. C. M. 1, *Pseudo-Larix Kämpferi*; 2, *Libocedrus chilensis*; 3, *Abies Douglasii*, from Vancouver Island; 4, *Retinospora leptoclada*; 5, *Taxodium distichum*; 6, *Thuja occidentalis*, or it may be a variety of it. We should be thankful for a specimen in fruit of No. 2.—A. G. 1, *Solidago virga aurea*; 2, *Ballota nigra*; 3, *Hieracium* sp.; 4, *Ranunculus acris*; 5, *Matricaria inodora*; 6, *Lapsana communis*; 7, *Atriplex patula*; 8, *Chenopodium polyspermum*; 9, *Asclepias curassavica*; 10, *Polygonum cuspidatum*. Another time do not send more than six, and send good specimens.—T. R. J. 1, *Alstroemeria aurea*; 2, *Ancone japonica* var. *Honorine Jobert*; 3, *Sedum Sieboldii* variegatum; 4, *Phlox paniculata*.—G. Bath. *Picea Lowiana* of Gordon, or *Pinus grandis* of Parlatore.—T. T., *Cullompton*. *Maxillaria Houtteana*, provided your sketch of leaf and bulb is correct. If it is fantastic, and the real leaf is very long and linear, then it is *M. tenuifolia*.

NEW CUCUMBER: R. Cragg. Send a fruit to the Royal Horticultural Society's Fruit Committee in a condition fit for use. If it is an old sort it would probably be recognised there.

PITTOSPORIUM TOBIRA.—It is an old-fashioned greenhouse plant—hardy in many localities—that should be obtainable at any plant nursery.

PLANTS FOR EFFECT: *Contant Reader*. These classes at flower shows are generally unsatisfactory, for want of definition. You ask,—When the schedule says

"Finest collection of plants arranged for effect," is the merit of the individual plants considered, or is it effect only? We think the words "finest collection" indicate that the framers of the schedule had meritorious cultivation in view, as well as meritorious arrangement, but it should have been more clearly expressed.

PRUNING OLO FRUIT TREES: *Feltm.* You had better consult some practical fruit grower than trust to the information to be found in books, which would, in all probability, not be applicable to such a case as yours. Then when the trees are reduced to order the book advice would be useful.

REFUSAL OF CHARACTER: *M. E.* We cannot advise you; we only know your view of the case. Apply to the magistrate, or consult a solicitor.

ROOTS ON VINE STEMS: *Old Subscriber.* They indicate one or both of two things—imperfect root-action, or a very damp, perhaps excessively damp, atmosphere acting on individual Vines which are in this condition; or in some cases it may be exuberance of growth developing itself in this particular form.

FOREIGN SUBSCRIBERS sending Post-office Orders are requested to make them payable at the post-office, King Street, Covent Garden, London, and at the same time to inform the Publisher at the office of this journal.

CATALOGUES RECEIVED.—Emil Liebig (Handels Garterei, Dresden), Catalogue of Azaleas, Camellias, Rhododendrons, Roses, &c.—W. Markets.

COVENT GARDEN, September 6.

Our market is now very bare of fruit, with the exception of Apples and Nuts; of the former we are getting a very fair supply, while of the latter (if this week is any criterion) the crop must be the heaviest known for many years. Plums are a complete failure, the supply, with now and then an exception, being entirely from abroad. Large quantities of Grapes are reaching us from the Channel Islands, and fetching fair prices. Trade quiet. James Webber, Wholesale Apple Market.

FRUIT.

Table with 2 columns: Fruit and Price. Includes Apples, Grapes, Lemons, Melons, Nuts, Cobs, Oranges, Peaches, Pears, Pine-apples, Figs, green.

VEGETABLES.

Table with 2 columns: Vegetable and Price. Includes Artichokes, Aubergines, Beans, Carrots, Cauliflowers, Celery, Chilis, Cucumbers, Eodive, Garlic, Herbs, Horse Radish, Leeks, Lettuce, Mushrooms, Onions, Parsley, Peas, Radishes, Spinach, Turnips, Vegetable Marrows.

Potatoes.—Kent Regents, 100s. to 120s.; Kent Kidneys, 140s. to 160s.; Shaws, 120s. per ton.

CUT FLOWERS.

Table with 2 columns: Flower and Price. Includes Achillea, Asters, Bouvardias, Calceolaria, Chrysanthemum, Cornflower, Dahlias, Eschscholzia, Eucharis, Gardenia, Heartsease, Heliotropes, Jasmine, Lilies, Mignonette, Pelargonium, Primula, Pyrethrum, Roses, Stephanotis, Stocks, Sunflower, Sweet Peas, Tropaeolum.

PLANTS IN POTS.

Table with 2 columns: Plant and Price. Includes Balsams, Begonias, Bouvardias, China Asters, Chrysanth., Clematis, Cockscombs, Coleus, Cyperus, Dracaena terminalis, Ficus, Ficus elastica, Fuchsias, Heliotrope, Hydrangea, Liliums in var., Mignonette, Myrtles, Palms in variety, Pelargon., Petunias, Roses, Solanums, Valotta purpur.

SEEDS.

LONDON: Sept. 5.—No special feature of interest has this week been developed in connection with the trade for farm seeds. Owing to the recent badness of the weather, and the damage thereby inflicted on the growing crops, yearling Clover seeds are naturally held with greater firmness; but, as respects red seed, no large amount of business has yet resulted. New Bordeaux red is offering at a moderate figure. The speculative inquiry for Alsike has driven up quotations several shillings per cwt. For white Clover seed rates are likewise tending upwards. In Trefoils there has been some business doing at former currencies. The excessive and continued rains have kept back the supply of new Mustard and Rape seed. Winter Tares command a ready sale at last week's prices. For sowing Rye there is also a brisk request. More money is now asked for imported Italian and perennial Rye grasses. The trade for bird seeds exhibits no noteworthy alteration. Blue Peas are firmer, especially for sound dry samples; a considerable portion of the new crop having suffered greatly from the wet. John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.

CORN.

At Mark Lane on Monday there was not that amount of business in the trade as the state of the weather seemed to warrant. As regards Wheat, prices were not generally better than on the previous Monday. Barley experienced a slow sale at full prices. Some new imported produce of ordinary quality was held for about 45s. per quarter. Malt was steady, without change. Oats were rather dearer in some cases, while the market for Maize had a decided upward tendency. Beans and Peas were nominal, as also was the trade in flour.—Trade was quiet on Wednesday, but the tone continued firm. English Wheat was fully as dear, while as regards spring corn of superior quality there was a disposition to ask higher prices, the weather being unfavourable for the importation of produce in good condition.—Average prices of corn for the week ending Sept. 1.—Wheat, 62s.; Barley, 34s. 6d.; Oats, 27s. 5d. For the corresponding week last year:—Wheat, 45s. 11d.; Barley, 30s. 8d.; Oats, 27s. 7d.

CATTLE.

At Copenhagen Fields on Monday there were a few more beasts than on the previous Monday, and the dead trade was worse, consequently prices were lower. A clearance was not effected. There were also a few more sheep and lambs. Trade was slow for sheep, but choicer qualities were not much lower. The lamb season is nearly over; very few are required, and those at much lower rates. Trade for calves was dull, prices rather lower on the average.—Quotations:—Beasts, 4s. 4d. to 5s., and 5s. 6d. to 6s.; calves, 5s. to 6s. 2d.; sheep, 5s. 6d. to 6s., and 6s. 6d. to 7s. 2d.; lambs, 6s. 4d. to 7s. 4d.; pigs, 4s. to 5s. 4d.—On Thursday trade was rather quiet. Supplies were short, but sufficient for the demand. Beasts sold quietly at about Monday's prices, whilst sheep were a quotation easier. Calves also gave way, and pigs sold slowly.

HAY.

At the Whitechapel market on Monday, with moderate supplies and a fair trade, prices were unchanged. Prime old Clover, 100s. to 140s.; inferior, 85s. to 95s.; good new Clover, 100s. to 120s.; prime old meadow hay, 90s. to 120s.; and inferior, 70s. to 85s.; good new hay, 80s. to 100s.; and straw, 44s. to 50s. per load.—On Thursday the market was moderately supplied with hay and straw. There was a brisk trade, especially for good qualities, and prices were firm. Quotations:—Prime old Clover, 100s. to 140s.; inferior, 85s. to 95s.; good new, 100s. to 120s.; prime old meadow hay, 90s. to 120s.; inferior, 70s. to 85s.; good new, 80s. to 100s.; and straw, 44s. to 57s. per load.—Cumberland Market quotations.—Superior old meadow hay, 110s. to 120s.; inferior, 70s. to 92s.; superior Clover, 132s. to 140s.; inferior, 90s. to 110s.; and straw, 54s. to 60s. per load.

POTATOS.

The Borough and Spitalfields markets reports state that there was a steady trade, with little change in prices. Kent Regents, 80s. to 110s. per ton; Essex ditto, 80s. to 100s.; Kidneys, 100s. to 120s.; Early Rose, 85s. to 110s.—The imports into London last week were very trifling, being confined to the receipt of 993 bags from Hamburg.

COALS.

Monday's business at the market showed no improvement on the prices of last week, but on Wednesday there was a good demand, and "seconds" and Hartley's rose 6d. per ton. Quotations.—East Wylam, 17s. 6d.; Hartley's Hartley, 17s. 3d.; Walls End—Hetton, 20s.; Hetton Lyons, 17s. 9d.; Hawthorns, 17s. 9d.; Lamiton, 19s. 6d.; South Hetton, 20s.; Hartlepool, 19s.; East Hartlepool, 19s. 9d.; South Kelloe, 18s.; Tees, 19s. 9d.

GARDEN REQUISITES, NURSERY-MEN'S and SEEDSMEN'S SUNDRIES.

Cocoa-nut Fibre, finest Kent and Hampshire Peats, Yellow Loam, Leaf-mould, coarse and fine Sand, Spagnum, all Manures, Tobacco Cloth and Paper, Garden Sticks and Labels, Russia Mats, Raffia, Pot Covers, Hyacinth Glasses, Tiffany, Scrub, Tanned Twine, Coar Yarn, Garden Pots and Pies, and every Horticultural Requisite. Write for free Price List. Liberal terms to the Trade. Delivered free within 4 miles of Covent Garden at List Price. 4s. per Ton CARTAGE ALLOWED IF FETCHED FROM CASTLE STREET, LONG ACRE. M. H. BENFOTE, Horticultural Sundriesman, 8, Castle Street, Long Acre, W.C.: 3 minutes from Covent Garden. Open at 4 o'clock in the morning for Market Customers. Factory, Nunhead, S.E.

THE EUREKA POST BOX.—

Specially adapted for the postal transit of Fruit, Plants, Flowers, &c. Price 4s. 6d. per dozen, Sample Box, with Grapes or Strawberry Plants enclosed, post-free, 1s. W. LOVELL, Weaverthorpe, York.

HORTICULTURAL WINDOW GLASS.

—A large variety of sizes, 15-oz., 22s. 6d.; 21-oz., 26s. 6d. per 100 feet. Large sizes, in Cases, for Cutting up—15-oz., 48s. 3d.; 21-oz., 65s. per 100 feet.—21-oz., 48s. 3d.; 25s., 46s. per 200 feet.—ALFRED SYER, Glass, Lead, Zinc, Oil, and Colour Merchant, 8, Pentonville Road, London, N.

Cheapest House in the Trade. HENRY WAINWRIGHT, GLASS and LEAD MERCHANT and GENERAL DEALER in Plumbers' Materials, Alfred Street, Boar Lane, Leeds.

Special attention paid to Glass for Horticultural Purposes. 300 PANES of beautiful strong Glass, 8 by 6, for 12s. 6d. GLASS TILES for Roofing, Manures of best LINSEED OIL, PUTTY, SHEET LEAD and LEAD PIPE. Prices on application.

Rosher's Garden Edging Tiles.

THE ABOVE and many other PATTERNS are made in materials of great durability. The plainest sorts are specially suited for KITCHEN GARDENS, as they harbour no Slugs or Insects, take up little room, and, once put down, incur no further labour or expense.

as do "crown" Edgings, consequently being much cheaper. GARDEN VASES, FOUNTAINS, &c., in Artificial Stone, very durable and of superior finish, and in great variety of design. F. ROSHER AND CO., Manufacturers, Upper Ground Street, Blackfriars, S.E.; King's Road, Chelsea, S.W.; Kingsland Road, E. Agents for LOOKER'S PATENT "ACME FRAMES," PLANT COVERS and PROPAGATING BOXES; also for FOXLEY'S PATENT BEADED GARDEN WALL BRICKS. Illustrated Price Lists free by Post. The Trade supplied.

ORNAMENTAL PAVING TILES,

for Conservatories, Halls, Corridors, Balconies, &c., from 3s. per square yard upwards. Pattern Sheets, of plain or more elaborate designs, with prices, sent for selection. WHITE GLAZED TILES, for Lining Walls of Dairies, Larders, Kitchen Ranges, Baths, &c. Grooved and other Stable Paving of great durability, Wall Copings, Drain Pipes and Tiles of all kinds. Roofing Tiles in great variety, Slates, Cement, &c. F. ROSHER AND CO., Brick and Tile Merchants. See addresses above.

SILVER SAND,

fine or coarse grain as desired. Prices by Post per Ton or Truck-load, on Wharf in London, or delivered direct from Pits to any Railway Station. Samples of Sand free by post. FLINTS and BRICK BURRS for Rockeries or Ferneries. KENT PEATS or LOAM supplied at lowest rates in any quantities. F. ROSHER AND CO.—Addresses see above. West End Steam Joinery, Newcastle.

Oil Paint No Longer Necessary.

HILL AND SMITH'S BLACK VARNISH for Preserving Ironwork, Wood, or Stone. This Varnish is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requires no mixing or thinning, and is used all over the world. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received, which HILL & SMITH will forward on application.

Sold in casks of about 30 gallons each, at 1s. 6d. per gallon, at the Manufactory, or 1s. 8d. per gallon carriage paid to any Station in the Kingdom.

UNSOLICITED TESTIMONIAL RECEIVED MAY 3, 1877. "The Kytles, Alderly Edge, Manchester.—Messrs. Hill & Smith.—Sir,—For some 20 years I have used your 'Black Varnish,' and shall be glad if you will forward me another cask, as I consider it the best thing known for the preservation of all outdoor work, either wood or iron, that requires to be painted. —Yours respectfully, ALFRED LOWE, J.P."

Apply to HILL and SMITH, Brierley Hill Ironworks, near Dudley; and 128, Queen Victoria Street, London, E.C., from whom only it can be obtained.

CAUTION.—It having lately come to the knowledge of HILL & SMITH that spurious imitations of this Varnish are being offered by unprincipled dealers at a slight reduction in price, they would especially draw attention to the fact that every cask of their Varnish is legibly marked with their name and address, without which none is genuine.

CARSONS' PAINT,

PATRONISED BY THE QUEEN, H.R.H. THE PRINCE OF WALES, H.R.H. THE DUKE OF EDINBURGH, The British, Indian and Colonial Governments, 10,000 of the Nobility, Gentry, and Clergy, Railway and Canal Companies, Collieries, Ironmasters, &c., &c.,

OUTDOOR WORK.

It is especially applicable to **WOOD, IRON, BRICK, STONE & COMPO.** CAN BE LAID ON BY UNSKILLED LABOUR.

Sold in all Colours.

2 cwt. free to all Stations.

MR. MECH'S ADDRESS to his OLD FRIENDS and CUSTOMERS and to the PUBLIC:—

"As it has been erroneously supposed by some that I am no longer interested in my London business, I think it desirable to state that I continue to carry it on as energetically, and I trust as satisfactorily to the Public, as formerly, assisted by my only son, who will in due time succeed me. It is now fifty years ago since I first commenced business in Leadenhall Street, and what changes have taken place! Then everybody shaved, and my razor and razor-strop trade was immense; now mustache and beard are the order of the day, and the razor and strop trade is comparatively defunct. Then there were no railways, so people stayed at home and used wooden dressing-cases; now everybody travels by rail, and we have dressing-bags to suit the altered conditions. Fifty years ago the poor City will remember the quality of Mech's shilling pen-knives; but steel pens have extinguished the pen-knife trade and the penmaking machines, and the geese are in peace, except at Michaelmas. In fact, steam has altered, and I may safely say, improved everything, and has made us a nation of travellers both by land and sea. I wonder how much time is now occupied in reading the steam-worship press? and how much less time is occupied in sipping port wine, as we used to do fifty years ago, when we could not travel? Steam will make our 4 lb leaves cheaper some day, just as it has converted calico from 2s. 6d. to 6d. or less per yard. Then, again, a letter which used to cost 6s. 6d. to Cork is now carried for 1d. Sir Rowland Hill richly deserves a monument. But to return to my case: fifty years ago, when I first commenced on a small scale, I made it an axiom that what I sold should be good and useful, and I believe thousands who used the strop and paste, which I personally invented, can testify to this; it fact, it was sometimes complained of that I stamped on my razors 'Exchanged if not approved.' I have never, and shall never so long as I live, deviate from that principle, because it is the true means to retain and increase one's connection. I devoted my attention especially to the quality and convenience of arrangements in the dressing bag and dressing case department, as well as on the matter of dispatch boxes and writing cases. Although both razors and penknives have 'gone out,' our sportsmen remain, and 'sporting knives' form one of our special departments. I feel firmly convinced that there is no fear of the departure of knives and forks, or dinners, so we make this an important department in quality and price. In conclusion, I ask no favours, but simply desire that my customers should compare the quality and price of my wares with those of other dependable establishments, and form their own conclusions. Most of my worthy assistants and workmen have been nearly forty years in my service, and long ago learned that civility and attention to our customers are as important as good quality in the articles sold. Illustrated catalogues will be forwarded post-free on application."

112, Regent Street, W., opposite Vigo Street.—1877.

JONES'S PATENT "DOUBLE L" SADDLE BOILER.

These Boilers possess all the advantages of the old Saddle Boiler, with the following improvements—viz., the water-space at back and over top of saddle, increases the heating surface to such an extent that a "PATENT DOUBLE L SADDLE BOILER" will do about twice the amount of work with the same quantity of fuel; the cost of setting is also considerably reduced, and likewise the space occupied; at the same time these Boilers are simple in construction, and being made of wrought iron are not liable to crack. They are made of the following sizes:—

Sizes.			To heat of 4-in. Pipe.	Price.
High.	Wide.	Long.	Feet.	£ s. d.
20 in.	18 "	18 "	300	7 0 0
20 "	18 "	24 "	400	8 0 0
20 "	18 "	30 "	500	9 0 0
24 "	24 "	24 "	700	12 0 0
24 "	24 "	30 "	850	14 0 0
24 "	24 "	36 "	1,000	16 0 0
24 "	24 "	48 "	1,400	20 0 0
28 "	28 "	60 "	1,800	25 0 0

Larger sizes if required.

From MR. CHARLES YOUNG, Nurseries, Balham Hill, S.W., May 29, 1873.

"Having given your Patent 'Double L' Boilers a fair trial at my Nurseries, I beg to say that they are most satisfactory. I consider them the best in use, and without doubt the most economical of all boilers; they will burn the refuse of other tubular boilers I have in work."

PRICE LISTS of HOT-WATER PIPES and CONNECTIONS, with Boilers, of all sizes and shapes; or ESTIMATES for HOT-WATER APPARATUS, erected complete, will be sent on application.

J. JONES and SONS, Iron Merchants, 6, Bankside, Southwark, London, S.E. When ordering Boilers please refer to the above advertisement.

For Prices, Description, and Reports of Working, apply
 to the Manufacturers,

AVELING & PORTER,

ROCHESTER, KENT; 73, CANNON ST., LONDON,
 E.C.; and 9, AVENUE MONTAIGNE, PARIS.

AVELING & PORTER'S ENGINES have gained the highest
 Prizes at every important International Exhibition. The two
 Medals for Progress and Merit were awarded them at Vienna
 for their STEAM ROLLERS and ROAD LOCOMOTIVES;
 and at the last trials of the Royal Agricultural Society of
 England their AGRICULTURAL LOCOMOTIVES gained
 the First Prize after exhaustive trials, when one of their 10-horse
 power Engines, fitted with single slide and ordinary link-
 motion, indicated 35-horse power, with a consumption of three
 and one-fifth pounds of coal per horse-power per hour.

AN EXTRAORDINARY BOILER.—
 During the Great Boiler Contest at Birmingham, in
 1872, all Boilers were severely tested to prove their respective
 merits. One test was, "How long can each Boiler go without
 Night Attention?" However, one Boiler proved this to a sur-
 prising degree, as after being shut up for twelve hours (from
 9 P.M. to 9 A.M.), it still retained its heat in 1000 feet of 4-inch
 pipes, and yet had more than 1 bushel of fire drawn from its
 furnace in the morning—equal, in point of fact, to seventeen
 hours of continuous firing. What a boon to Gardeners. This
 was THE CHAMPION, Deards' Patent Close-Coil Boiler, for
 Drawings and Prices of which send two stamps to

Messrs. DEARDS, Boiler Works, Harlow,
 who now have their Boilers at work in every county of England
 except three. Amateurs will also find THE WONDER, a
 smaller kind of Boiler, equally as satisfactory, and certainly
 "the best thing" out. Awarded five First Prize Silver Medals.

Copy of a Testimonial.

"Messrs. SILVESTER. Royal Exotic Nursery, King's Road,
 Chelsea, S.W.—Aug. 8, 1877.

"GENTLEMEN.—In reply to your enquiry as to our opinion
 of your Stevens' Trentham Boilers, we do not hesitate to pro-
 nounce them to be by far the best Boilers we have ever used.
 Our establishment is a very large one, and we have tested most
 of the various descriptions of Boilers which have been brought
 out from time to time. We originally commenced with one Tren-
 tham Boiler, and we have now thirteen of various sizes at work.
 For certainty of action, economy in fuel, and freedom from
 breakdown, we have never had a Boiler at all equal to the
 Stevens' Riveted Trentham Boilers supplied by you, and we
 have never felt so little anxiety in connection with our hot-
 houses during the cold winter months as we do now."

"We are not in the habit of giving testimonials, but we
 think this may fairly be an exception to our rule, as the matter
 is one of such importance to the Gardening Public generally,
 and our experience has led us to form a very decided opinion.
 We are, Gentlemen, yours faithfully,

"JAMES VEITCH AND SONS."

For Illustrations, with full particulars, apply to the Sole Makers,
F. & J. SILVESTER.

HOT-WATER ENGINEERS, &c., &c.,
 Castle Hill Works, Newcastle, Staffordshire.

Our Boilers are the ONLY ones made with the sanction
 and under the inspection of the inventor, Mr. Stevens—all
 others being mere imitations.

PARTNERSHIP.—A Nurseryman, carrying on a successful business within 25 miles of London, is desirous of meeting with a Partner. Failing health causes Advertiser to wish to find a man, or men who in, say, one or two years would be able to take over from him the entire business. Money would be required, but every facility be afforded provided substantial guarantees were given. The fullest references given and required.—Address, by letter, giving outline of means and position, NURSEYMAN, Messrs. Norris, Allens & Carter, Solicitors, 20, Bedford Row, London, W.C.

WANTED, a steady respectable married Man as HEAD GARDENER, who thoroughly understands his business in every department, both inside and out. Wages 25s. per week, with lodge, coals and gas. The Wife would have to attend to the Lodge Gate. A man without family preferred.—Mr. W. H. JONES, The Grange, Hooton, Chester.

WANTED, in Yorkshire, a thorough WORKING HEAD GARDENER. Must understand Vines, Melons, &c. Must Sing in surplised choir—Bass preferred. Wife can have Washing if competent.—L. L., Green's Library, Beverley.

WANTED, a Young Man as UNDER GARDENER.—Must well understand Kitchen and Fruit Gardening; a Churchman preferred. Wages, 25s. a week.—Apply, stating age, with references, to H. ANDREWS, The Gardens, Wootton Court, Canterbury.

WANTED, a MAN and his WIFE—the Man a good Working Gardener, the Wife a thoroughly good Laundress. A good house, and all requisites for the laundry supplied.—J. T. COLLIN, Esq., Wenden, Saffron Walden.

WANTED, a MAN, to Grow Plants for Shop, and make himself generally useful.—J. GRAY, Florist, Notting Hill, W.

Nursery Foreman. WANTED, a steady active Man as GROUND FOREMAN. Must have good knowledge of the Culture of Fruit and Ornamental Trees, Shrubs and Evergreens.—Address, stating age, wages expected, and reference to former employers, to THOMAS DAVIES AND CO., Wavertree Nursery, near Liverpool.

Gardener. WANTED, a MARRIED COUPLE, at Michaelmas.—Wife to attend to Laundry. Wages, 12s and large cottage.—M., The Elms, Hampton.

To Gardeners. WANTED, a MANAGER, to take a Share in, and the Sole Charge of a Forcing Business, where there are 10,000 feet superficial of Glass, Heated by Hot-water, and which would be added to any extent—or the whole Business could be taken and a Lease granted. Owner advertises. Address by letter, enclosing stamped directed envelope, T., Mrs. Bourne, 8, Wren Road, Camberwell, S.E.

MR. A. HOSSACK, Gardener to the Marquis of Hertford, Ragley Hall, Alcester, is in WANT of a Young MAN well versed in the Cultivation of Fruits on walls, &c. To a persevering man every encouragement will be given.—Apply as above, stating experience and references.

Propagator of Roses, Rhododendrons, &c. PAUL AND SON want a clever, experienced Man, as Propagator (Indoors) of Roses, General Hardy Stuff, and Soft-wooded Plants. Efficient help and every encouragement given to a really painstaking Man.—Apply, by letter, to The Old Nurseries, Cheshunt, N.

To Working Gardeners and Others. WANTED, a GROUND WORKMAN, to Superintend and Assist in Laying-out of Grounds in the North of England.—Apply, with reference or testimonials, to J. PRINGLE, Landscape Gardener, Wragby, Lincolnshire.

WANTED, a Young Man, of good address, as SHOPMAN. Must thoroughly understand the Vegetable and Flower Seed Trade; also Bulbs, Everlasting Flowers, and Garden Requisites.—Address, in the first instance, to Messrs. NUTTING AND SONS, Seed Merchants, 60, Barbican, London, E.C.

WANTED, an experienced Out-door NURSERY FOREMAN and SALESMAN. State age, references, and wages required.—R. THORNHILL, Bowdon Nurseries, Bowdon, Cheshire.

Packer. WANTED, an experienced PACKER of General Nursery Stock.—Apply, in own handwriting, stating wages, references, and where last employed, to CRANSTON AND CO., King's Acre Nurseries, Hereford.

WANTED, a CORRESPONDING CLERK and BOOK-KEEPER; must be well acquainted with the Nursery Business, and competent to take the Entire Correspondence, and occasionally to Travel. Unexceptionable references required.—Apply, stating salary required, &c., to CRANSTON AND CO., King's Acre Nurseries, Hereford.

Seed Trade. WANTED, a SECOND SHOPMAN and WAREHOUSEMAN, also a JUNIOR ASSISTANT.—Apply, giving full particulars of age, experience, and references, to W. TAIT AND CO., 45, Capel Street, Dublin.

WANT PLACES.

B. S. WILLIAMS, having at the present time several very excellent GARDENERS upon his Register, is desirous of placing them in Situations where great experience and trust are required.—B. S. W. would at the same time beg to intimate that when a Gardener is applied for that the filling of the situation should be left with him, as that would prevent unnecessary correspondence and delay.—Victoria and Paradise Nurseries, Upper Holloway, London, N.

Head Gardeners.

JOHN LAING AND CO. can at present recommend with every confidence several energetic and practical Men, of tested ability and first-rate character. Ladies and Gentlemen in WANT of GARDENERS and BAILIFFS, or GARDENERS for First-rate Establishments or Single-hand Situations, can be suited, and have full particulars by applying at Stanstead Park and Rutland Park Nurseries, Forest Hill, London, S.E.

E. G. HENDERSON AND SON have many excellent GARDENERS with approved testimonials for ability now waiting in their Nurseries for re engagement.

E. G. H. & Son will be pleased to answer any enquiries from Noblemen and Gentlemen requiring such.—Pine-apple Nursery, Maida Vale, London, W.

GARDENER (HEAD).—Mr. RABONE, Head Gardener, Alton Towers, can highly recommend to any Nobleman, Lady, or Gentleman, requiring a thorough practical Man, one who has had twenty years' experience in some of the first gardens in England.

GARDENER (HEAD).—Age 36, married; twenty-three years' practical experience in the Cultivation of Vines, Pines, Peaches, Cucumbers, Melons, Stove and Greenhouse Plants, Flower and Kitchen Gardening. Nine years' character from present employer.—H. M., 41, Reservoir Road, Edgbaston, Birmingham.

GARDENER (HEAD), to any Nobleman or Gentleman requiring the services of a thorough competent and experienced Man; age 31, married.—Mr. WALTER CHURCH, Gardener to the Rt. Hon. the Earl of Coventry, can with every confidence recommend a trustworthy Man in the above capacity. Please address, Croom Court, Severn Stoke, Worcestershire.

GARDENER (HEAD), age 38, married.—W. ROE is now at liberty to engage with any Lady or Gentleman requiring a thorough practical Man. Has had the entire Charge of the Gardens which belonged to the late Mrs. Sumpter, Manor House, Histon, for eleven years, and is now leaving on account of the death of his late employer, and the estate being shut up. Thorough knowledge of the Management of a large Garden, Early and Late Forcing, &c. Can forward good testimonials if required.—W. ROE, The Gardens, Maor House, Histon, near Cambridge.

GARDENER (HEAD), in a small place, or FOREMAN in a large establishment.—Age 24; has had eight years' practical experience, three as Foreman in the houses.—Can be highly recommended for abilities and general character.—T. COYSH, Jun., E. Wood, Esq., Newbold Revel, Rugby.

GARDENER (HEAD, WORKING).—Age 27; ten years' experience. Within 30 miles of London preferred.—A. K., Tandridge Court, Godstone, Surrey.

GARDENER (HEAD, WORKING), where a practical, experienced, trustworthy person is required.—Age 29, married. Highly recommended, with good testimonials.—B. H., Post-office, Chepstow, Monmouthshire.

GARDENER (HEAD, WORKING), only where thorough practical man is wanted.—Age 35; experienced in all branches. Seven years' character.—H. V., 2, Lough Villas, Handcroft Road, East Croydon.

GARDENER (HEAD, WORKING).—Age 32, married, no family; thoroughly practical in all branches of the profession. Good references.—W. T., 2A, Cirencester Street, Harrow Road, Paddington, London, W.

GARDENER (HEAD, WORKING).—Age 32, married, one child; thoroughly understands Forcing of Fruits, Flowers, and the General Routine of Gardening. No objection to Land and Stock.—A. B., 2, Sarah Cottage, Hawk's Road, Norbiton, Kingston-on-Thames, Surrey.

GARDENER (HEAD, WORKING) where two or more are kept.—Age 29, married, one child; having had fourteen years' practical experience in Noblemen's and Gentlemen's gardens, thoroughly understands the profession in all its branches. First-class character.—G. BALDWIN, Bishops Teignton, Teignmouth, Devon.

GARDENER (HEAD, WORKING, or good SINGLE-HANDED).—Age 30, single; understands Vines, Peaches, Melons, Cucumbers, Stove and Greenhouse Plants, Flower and Kitchen Gardening. State wages.—J. ELLIS, High Street, Southgate, N.

GARDENER (WORKING HEAD, or SINGLE-HANDED).—Age 30, married; a thorough knowledge of the profession. Good character.—C. W., Mr. Summer, Walten Road, East Molesey, Surrey.

GARDENER (HEAD), or GARDENER and MANAGER, to any Lady or Gentleman requiring a thoroughly practical Man.—Age 35, one child (age 5); understands the profession in all its branches, Land and Stock. Five years' good character from last employer.—J. GRIGGS, Mereworth, near Maidstone.

GARDENER, to take the Management of a Square. Five years in last place.—A. B., 64, Arlington Road, Camden Town, N.W.

GARDENER.—Age 36, married, one child (age 12).—A NOBLEMAN wishes to recommend his Gardener, who has been with him seven years, as a thorough practical man.—W. H., Norton Priory, Runcorn, Cheshire.

GARDENER, where two or more are kept. Good general knowledge of Plants, Fruits, and Flowers; also used to attend at Flower Shows. Can be well recommended.—G. G., The Gardens, Oakley, Fallowfield, Manchester.

GARDENER.—Age 29, single; just returned from a Farm in Canada, requires a permanent situation. Can Groom and Milk, and is willing to make himself generally useful. Good references.—V. M. J., 4, Moss Hall Grove, Finchley, N.

GARDENER.—JOHN COWAN, The Vineyard, Garston, near Liverpool, would be glad to recommend to any Nobleman or Gentleman requiring a first-class Gardener a Man in the prime of life, who thoroughly understands the profession in all its branches, having had many years' experience in some of the best places in England and Scotland.

GARDENER.—A GENTLEMAN, giving up his country house, wishes to recommend his Gardener to any one in want of a thoroughly trustworthy and efficient servant, who understands Vines, Greenhouse Plants, Flower and Kitchen Gardens; and whose Wife is an excellent Laundress.—Apply to the GARDENER, Cowby Hall, near Uxbridge, Middlesex.

GARDENER (SINGLE-HANDED or UNDER), near London.—Age 21; good character.—A. B., 103, Hassock's Gate, near Hurstpierpoint.

GARDENER (SINGLE-HANDED, or where one is kept).—Age 26, single; thoroughly understands the profession. Six years' good character.—C. C., 45, Pond Place, Fulham Road, S.W.

GARDENER (SINGLE-HANDED), or where there is another kept.—Age 26; has a fair knowledge of the profession; understands Grapes, Cucumbers, and Melons. Can be well recommended from present and previous employers.—A. B., Corbetsley, near Romford, Essex.

GARDENER (SECOND, or SINGLE-HANDED).—Age 27; three years' good character. Please state wages, &c.—H. K., Upper Caterham, Surrey.

GARDENER (SECOND), in the houses, under a Foreman.—Age 20; both preferred. Good reference.—G. C., Hill Hall, Epping, Essex.

GARDENER (SECOND), in a Gentleman's Garden.—Age 21; good references.—A. C., 2, Birchill Terrace, St. Margaret's Road, Hanwell.

GARDENER (SECOND).—Age 22; understands Stove and Greenhouse, Vines, and Flower and Kitchen Gardening. Total abstainer.—J. A. GARNHAM, 6, New Lane, Enfield, Middlesex.

GARDENER (UNDER), or JOURNEYMAN in a Gentleman's Garden.—Age 21; good character. Had several years' experience. Houses preferred.—C. M., Post-office, St. John's, Worcester.

GARDENER (UNDER).—Age 21; used to Kitchen and Flower Gardening; fair knowledge of Housework. Four and a half years' good character.—H. F., Mr. W. Bright's, Pines Street, Huntingdon.

GARDENER (UNDER).—Age 21; six years' experience, and three years' good character from last place.—J. B., Moor Street, Kidlington.

GARDENER (UNDER), in a Nobleman's or Gentleman's Establishment.—Age 20, single; has been brought up in the profession, and has a practical knowledge of Fruit Forcing, &c. Seven years' good character.—C. PATRICK, Rushton, Kettering, Northamptonshire.

STEWARD and HEAD GARDENER, or GENERAL ESTATE MANAGER.—Age 32, married. Thorough practical in the details of Farming, Home Park, Gardening, Laying-out and Ornamental Planting, Roads, Draining, Timber, &c. Good references for same.—R., 13, Waterford Road, Fulham, London, S.W.

To Noblemen and Gentlemen.

FARM STEWARD, BAILIFF, or GENERAL MANAGER.—Age 44, married, no family; has a thorough practical knowledge of Agriculture in every branch, both Light and Heavy Soils; Breeding, Rearing, Fattening, Burying and Selling all kinds of Stock and Farm Produce. Understands Draining, Farm Buildings, and Repairs, Woods and Plantations, Measurement of Land, Timber and Book-keeping. References and testimonials will bear strict investigation.—W. H., Post-office, Upton-on-Severn, Worcestershire.

To Nurserymen.

ROBERT CRAGG can recommend with confidence his FOREMAN, who is leaving, to any Nurseryman. He is well up in the Cultivation of Roses under glass and out-of-doors, also Rhododendrons, Fruit Trees, Conifers, and General Outdoor Work.—The Rose Nurseries, Car Colston, near Bingham, Notts.

FOREMAN, or SECOND, in a Gentleman's Garden.—Age 25; twelve years' experience in Plant and Fruit Growing, Flower and Kitchen Gardening. Three years' good character.—G. H., Haling Park Gardens, Croydon, Surrey.

To Nurserymen.

MANAGER, or WORKING FOREMAN.—A. WARNE, the advertiser, is desirous of a re-engagement where plants are grown in large quantities, either retail or wholesale. He is practically a thorough good Grower of Stove and Soft-wooded Plants, also well understands Forcing of Bulbous and other Plants. Formerly employed by Mr. J. Reeves, Acton, Middlesex; Messrs Carter & Co., Forest Hill; Messrs. Felton & Sons, Birmingham; and his present employer is Mr. T. Gilbert, Springfield Nursery, Hastings, by whom any enquiries will be answered. Will be disengaged on the 14th inst.—A. WARNE, Ashburnham Road, Clyde Vale, Hastings.

FOREMAN, in a Gentleman's Garden.—Age 27, single; twelve years' experience in Plant and Fruit Growing under Glass, Flower and Kitchen Gardening. Good references.—W. J. G., 41, Adelfi Road, Epsom, Surrey.

SEED TRADE.—HEAD COUNTERMAN, Age 23; over seven years' experience in good houses. Good references.—ALPHA, Keith & Co., Edinburgh.

MANAGER, BOOK-KEEPER, CONFIDENTIAL CLERK, or SHOPMAN, in a Nursery or Seed Business.—Age 32. First-class references.—K. W., Stroutian Lodge, Cotham, Bristol.

KINAHAN'S LL WHISKY.

Universally recommended by the Medical Profession. A pure old spirit, mild, mellow, delicious, and most wholesome. Dr. Hassall says, "The samples were soft and mellow to the taste, aromatic and ethereal to the smell. The Whisky must be pronounced to be pure, well-matured, and of very excellent quality."—Wholesale: 20, Great Titchfield Street, London, W.

DINNEFORD'S FLUID MAGNESIA.

The best remedy for ACIDITY of the STOMACH, HEARTBURN, HEADACHE, COLIC, and INDIGESTION; and the safest aperient for delicate Constitutions, Ladies, Children, and Infants. DINNEFORD AND CO., 172, New Bond Street, London, and all Chemists.

ELLIS'S RUTHIN WATERS.

PURE AERATED WATERS.

ELLIS'S RUTHIN WATERS.

Crystal Springs, Soda, Potass, Seltzer, Lemonade, Lique, and for Gout, Lithia and Potass. Corks branded "R. ELLIS AND SON, RUTHIN," and every Label bears their Trade Mark. Sold everywhere, and Wholesale of R. ELLIS AND SON, Ruthin, North Wales, London Agents; W. BEST AND SONS, Henrietta Street, Cavendish Square.

HOLLOWAY'S PILLS.—Health and Vigour.

—To the most regular livers occasional disturbances of digestion will occur, which may be corrected at once by these famous Pills, the alterative and tonic powers of which cannot be too highly extolled. A dose now and then will prove salutary to every one, but a continued course must be taken by the confirmed invalid. It is wonderful how the appetite and digestion improve in proportion as the Pills exert their wholesome influence over the animal economy. They augment Muscular Strength and Mental Vigour. Holloway's Pills frequently Cure Diseases of the Digestive Organs after all other medicines have failed to afford relief, and they are especially serviceable in Disorders of the Liver and Kidneys.

Cures of Asthma, Consumption, and Coughs, by DR. LOCKOCK'S PULMONIC WAFERS.

—Mr. LOCKOCK, 45, Fleet Street, Bury, writes:—"I have great pleasure in recommending the Wafers, knowing that they are a sure remedy, &c." In Asthma, Consumption, Bronchitis, Coughs, Colds, Gout, Rheumatism, and all hysterical and nervous pains, instant relief is given by DR. LOCKOCK'S WAFERS, which taste pleasantly. Sold by all Druggists, at 1s. 1/6d.

FRUIT, FRUIT, FRUIT.

To Market Gardeners and Others.

MR. TURNER will sell by AUCTION, at the Queen's Hotel, Macclesfield, on TUESDAY, September 18, at 4 o'clock in the afternoon, subject to conditions, all that FREEHOLD PLOT of LAND situate in Upton, near Macclesfield, containing one statute acre, together with the VINERIES, CUCUMBER-HOUSES, PROPAGATING-HOUSE, and other buildings recently constructed on the best system by the late Mr. Thomas Bayley. The Garden Plant comprises—Vineries: Four span-roof Vineries, 462 feet long inside, averaging 22½ feet wide, and 13 feet high in the centre, one of which has six rows of 4-inch hot-water pipes, and the other three have eight rows with valves complete; all have cisterns with supply of town's water, stop-taps, &c. There is also a large rain-water tank underground, with pump and trough. There are 122 choice Vines, three years old, and a quantity of Peach and Nectarine trees. Cucumber-houses, 130 feet long, averaging 12½ feet wide, and 10 feet high. In the Early house there are six rows of 4-inch bottom-pipes, and in the rest four rows, with top-heat pipes in all; cistern with hot and cold water, and 72 feet of forcing boxes. Propagating-house, 28 feet long, 9 feet wide, and 9 feet high. Frames: One span-roof 46-light frame, two lean-to roofs, each 12-light frames; three large protecting frames, two lean-to roofs, each 10-light cold frames; Rendall's patent slide span-roof cold frame, 3-light wood cold frames. Brick-built Boiler-house and Potting-house, 4 boilers; Wood Potting-house and Tool-house. Bed-house, 24 feet long, 12 feet wide. The ground is stocked with Fruit and Ornamental Trees, Shrubs, and several thousand Plants in Flower-pots. The Greenhouse is not completed; the walls are built, and the woodwork and pipes are ready for fixing. The Land, Buildings, Trees, Plants and Tools on the premises will be offered in one lot.

The Grounds may be viewed on application to the Gardener, on the Premises. Further particulars may be obtained, and a Plan of the Land seen, at the office of Messrs. PARROTT, MAY, and SONS, Solicitors, Macclesfield.

Preliminary Announcement.

IMPORTANT SALE of PLANTS, consisting of Azaleas, Camellias, Heaths, Palms, Tree Ferns, and a large collection of Dracenas, Crotons, Amaryllis, and other Plants suitable for Stove, Greenhouse and Conservatory Decoration.

THE

IMPROVEMENT OF LANDED ESTATES,

By DRAINAGE, ENCLOSING, CLEARING, THE ERECTION OF FARM BUILDINGS and COTTAGES WATER SUPPLY, &c.

The Land Loan and Enfranchisement Co.

(Incorporated by Special Act of Parliament)

ADVANCES MONEY.

1st.—To the OWNERS of SETTLED and OTHER ESTATES, for the Erection of Farm Buildings and Cottages, and for the Drainage, Irrigation, Enclosing, Clearing and General Improvement of Landed Property in any part of the United Kingdom.

2d.—To the OWNERS of SETTLED ESTATES in ENGLAND, for the Erection or Completion of Mansions, Stables, and Outbuildings, and for the Construction or Erection of Reservoirs, and other Works of a permanent nature, to supply Water for the use of the Estate, or for any other purpose.

3d.—To LANDOWNERS generally, to enable them to subscribe for Shares in Companies for the Construction of Railways and Navigable Canals, which will beneficially affect their Estates.

4th.—To INCUMBENTS, for the Improvement of their Glebe Lands, by Drainage, and the Erection of Farm Buildings and Cottages.

5th.—To COPYHOLDERS, for the Enfranchisement of Copyhold Lands.
The amount borrowed, with the expenses, would be charged on the Estate benefited, and repaid by a rent-charge, terminating in twenty-five years.

No investigation of the Landowner's Title is necessary. Forms of application, and all further particulars may be obtained of Messrs. RAWLENCE AND SQUAREY, 22, Great George Street, Westminster, S.W., and Salisbury; of Messrs. ASHURST, MORRIS, CRISP, AND CO., 6, Old Jewry, London, E.C.; of Messrs. GILLESPIE AND PATERSON, W.S., 87A, George Street, Edinburgh, Agents for the Company in Scotland; and at the Offices of the Company, as below.

Prospectus, with Press Notices, &c., post-free on application.

NEW LATE KEEPING BLACK GRAPE, "ALNWICK SEEDLING."

This Grape was exhibited before the Fruit Committee, South Kensington, February 6, 1876, under the name of CLIVE HOUSE SEEDLING, a name the Committee have since thought fit to alter. The following is the description given by the Fruit Committee:—"It is a seedling between the Black Morocco and an unnamed variety raised at Wortley. The bunch shown was of fair size and well shouldered, and the berries large, oval in form, and jet black in colour, with a thick skin. The flavour was decidedly good, partaking of the rich sparkling flavour of the Black Morocco, but much sweeter. It has kept well till February, and will, no doubt, keep longer and prove a better Grape for general cultivation than the Black Alicante."

This has been awarded a First-class Certificate.

B. S. W. has much pleasure in offering this fine new Grape, believing it to be a decided acquisition. The stock offered is from the original plant. Early orders are respectfully solicited, as the stock is limited.

Price 21s. and 42s. each.

NEW FIG—"HARDY PROLIFIC."

The fruit of this hardy Fig is about the medium size, Pear-shaped, rather tapering towards the stalk. The flesh is very sweet and luscious. It was introduced from France some few years ago, and has proved itself perfectly hardy. It must become a general favourite, as it is a very abundant bearer, either in pots or in a cold house, as well as on an open wall. It also ripens earlier than any other variety we know of.

Price 10s. 6d. each. Extra sized Fruiting Plants, 21s. each.

ISAAC DAVIES

Has now to offer a fine Stock of the

RHODODENDRONS and AZALEAS

RAISED BY HIM,

And which have been exhibited at various Flower Shows, and have received First-class Certificates of Merit.

SWEET-SCENTED RHODODENDRONS.

R. COUNTESS OF DERBY.—This is the most beautiful Rhododendron of its class. It is bushy-growing and very free blooming, the smallest plants bearing flowers which are pure white, very large, and most deliciously scented. Prices, 7s. 6d., 10s. 6d., 21s. each; a few extra large, 42s. and 63s. each.

R. COUNTESS OF SEFTON.—White with band of rosy purple on each side of the corolla, fringed margin. Prices, 3s. 6d., 5s., and upwards to 42s. each.

R. LADY SKELMERSDALE.—Pure white, exquisitely formed trumpet-shaped flowers, even edges and of great substance. Prices, 3s. 6d., 5s., and upwards to 42s. each.

R. MRS. JAMES SHAW.—Pure white, extremely free-blooming, and very lushy habit. Prices, 3s. 6d., 5s., and upwards to 42s. each.

R. DUCHESS OF SUTHERLAND.—Pure white flowers, fringed margin. Prices, 3s. 6d., 5s., 10s. 6d., and 21s. each.

The above are admirably suited for Growing in Cold-houses, without the necessity of artificial heat.

SWEET-SCENTED AZALEAS.

AZALIA DAVIESI.—Bears fine trusses of pale sulphur flowers, which change to white. This Azalea is perfectly hardy and very suitable for forcing. Good plants with flower-buds, 2s. 6d., 3s. 6d., and 5s. each.

A. HYBRIDA ODORATA.—A hardy bushy plant, bearing trusses of pure white sweet-scented flowers. Good plants 2s. 6d., 3s. 6d., and 5s. each.

RHODODENDRON MULTIFLORUM, fine bushes, covered with flower-buds, 2s. 6d. to 3s. 6d. each.

R. PRÆCOX, fine plants, well budded, 1s. 6d. to 2s. 6d. each.
R. PRÆCOX RUBRUM, well budded, 1s. 6d. to 2s. 6d. each.
R. PRÆCOX SUPERBUM, well budded, 1s. 6d. to 2s. 6d. each.

The above being Plants that were raised by me, I can recommend them with confidence.

LONDON SHOW ROOMS — 93 and 95, QUEEN VICTORIA STREET, E.C.

JOHN COWAN, THE VINEYARD, GARSTON, NEAR LIVERPOOL,

Begs to inform his numerous Friends and Patrons, and the Public generally, that he has now completed the Purchase of the above-named Establishment, and that he will from this date carry on the Business on his own behalf.

J. C. will devote his entire time to the Business, and hopes by strict attention and moderate charges to merit the confidence of his supporters.

Having every convenience and a Staff of experienced Assistants and Workmen, he is prepared to undertake the ERECTION of every description of HORTICULTURAL BUILDING and HEATING of same. Also the HEATING of Mansions, Churches, Public Buildings, &c.

J. C. is introducing a new form of SADDLE BOILER, combining all the good points attainable in a Boiler, and he believes that where the Limekiln system cannot be adopted, his new Boiler will prove the most economical and effective that can be used.

In the NURSERY DEPARTMENT, J. C. will give special attention to the production of young VINES, and embraces this opportunity to state that his stock is, this season, in splendid condition. He is now Booking Orders to be sent out as the Vines are required.

Illustrated PAMPHLET and CATALOGUE Free on application.

JOHN COWAN, THE VINEYARD, GARSTON, NEAR LIVERPOOL.

Prepared by JOHN KILNER, Wortley, near Sheffield.

AMIES' CHEMICAL MANURE.

Used by the Royal Horticultural and Botanic Societies.

This Manure, after six years' trial, is unapproached in its results by any other manure. It is suitable for all soils, and permanently improves the fertility of even the poorest. It provides the necessary foods for plants, creates a vigorous growth without over-stimulating, and it increases the produce. It is a powerful insecticide. It has been used with perfect success on

FLOWERS, SHRUBS, VEGETABLES, FRUITS, GRASS, VINES.

PREPARED IN A FINE, DRY, INODOROUS POWDER.

Price, £12 per Ton; 15s. per Cwt.; and in Canisters, 18s., 2s. and 4s. each.

Trial Orders of the Manure are invited, to be used in comparison with other Manures.

Write for Further Particulars to

AMIES' CHEMICAL MANURE CO. (LIMITED), 79, MARK LANE, LONDON, E.C.

THE "ELIXIR,"

OR

BUFFALO HORN MANURE.

JOHN WILLS, F.R.H.S.,

Is now prepared to supply the above Manure, in large and small quantities, at £44 per ton.

May be had in Bags, from 1s. 6d. to 10s. 6d. each.

THE "ELIXIR" IS VERY LIGHT, ONE TON BEING EQUAL TO SIX TONS OF BONES.

There can be no doubt as to the "Elixir" being the very best Manure in present use for general purposes. It is used largely in the Vineyards of France and Italy.

J. WILLS has proved its efficiency on many occasions, at each of his own Establishments, and beyond making these remarks, will say nothing more in its favour, but leave the public to judge for themselves, as to its value, from the following

TESTIMONIALS.

THE "ELIXIR," or BUFFALO HORN MANURE.

"Royal Horticultural Gardens, Chiswick, August 14, 1877.

"Dear Sir,—You ask me my opinion of the Buffalo Horn Dust. I give it you. Early in 1876 Messrs. Taylor & Co., of Clapham, sent a good sample of it here for trial as manure. It has been tried and tested in various ways—in comparison with ordinary stable manure, guano, other patent manures, &c., with most satisfactory results. We have used it, mixed with soil, for potting plants, such as Vines, Peaches, Cucumbers, Fuchsias, Pelargoniums and various others, and as top-dressings in the same manner. Also in the formation of a new Vine border last autumn.

"In each and all cases, the deep green hue which the foliage soon assumes, and the great vigour which is imparted, is very striking and notable. Its light, fibry composition makes it most suitable for mixing with the soil for potting, and when used as top-dressing the roots are soon seen to permeate the entire mass. In the case of the orchard-house trees and Vines so treated the effects are astonishing.

"No manure that we have ever used here has produced results so decided, so apparent and satisfactory.

"I therefore consider the Buffalo Horn Dust to be the most efficient of manures, and intend to use it largely.

"I am, dear Sir, yours very truly,

"Mr. JOHN WILLS."

"A. F. BARRON."

"The Gardens, Heckfield, Winchfield,
June 29, 1877.

"DEAR SIR,—In reply to your enquiry as to what opinion I have formed of the *Horn Manure* I bought of you some few months ago I am able to report, *most favourable*. I have used it principally for Pines, Vines, and Strawberries in Pots, and in each case its effects were of the first order. I am so convinced of its superiority over other Bone Manures for Vines that I have used *this only* in a new border I had to make, and the Vines are making the most magnificent growth. I shall be happy very fully to report results in due course.—I remain, dear Sir, very truly yours, W. WILDSMITH, Gardener to Viscount EVERSLIGH."

"J. WILLS, Esq."

"June 30, 1877.

"DEAR SIR,—I have the pleasure to inform you I have tried your Horn Manure, and the results are most satisfactory. I have it mixed in the soil with such things as Fuchsias, Pelargoniums, Geraniums, Gloxinias, Humsa elegans, Neapolitan Violets, and in each case it could be seen at a glance, amongst others that had not any of the mixture, by their stronger and robust habit, a much more green and healthier appearance.—Yours very truly, F. RUTLAND, Gardener to the Duke of RICHMOND and GORDON."

"Mr. WILLS."

"The Gardens, Syon House, Brentford,
May 16, 1877.

"DEAR SIR,—I consider your manure an excellent fertiliser; it is clean to use, and, I believe, will be lasting in its effects.—Yours faithfully, JOHN WOODBRIDGE, Gardener to the Duke of NORTHUMBERLAND."

"Mr. J. WILLS."

"Victoria and Paradise Nurseries, Upper Holloway,
London, N., July 6, 1877.

"DEAR SIR,—I have tried your Horn Manure on Dracenas, Crotons, Ixoras, Grape Vines, and consider it one of the best Manures we have used.—Yours faithfully,

"Mr. J. WILLS."

"B. S. WILLIAMS."

"The Gardens, Crewe Hall, June 2, 1877.

"DEAR SIR,—I have tried the New Manure you were so kind as to send me on Fuchsias, Pelargoniums, Marantas, Caladiums, Anthuriums, and other Stove and Greenhouse Plants; and found its effects to be most beneficial wherever it was used. I consider it to be a most excellent Manure, and if it could be supplied in quantity at a reasonable price, would (I have no doubt) be a valuable Manure for Vine Borders, as well as Fruit Trees and Pot Vines, Pines, &c.—I am, dear Sir, yours very truly, W. WHITAKER, Gardener to Lord CREWE."

"Mr. WILLS."

"Castle Gardens, Arundel, July 20, 1877.

"MY DEAR SIR,—I don't think I could do better than enclose you the report I had from my foreman about the Manure you kindly sent me. I must tell you that I use a good deal of night soil mixed with the best loam for two years. You should see our Strawberries and French Beans grown in it.—Yours faithfully, JOHN WILSON, Gardener to the Duke of NORFOLK."

"Mr. WILLS."

"Balsams, scarlet Geraniums, Fuchsias, Crotons, Chrysanthemums, and Coleus made a rapid and vigorous growth, combined with healthy foliage: the Geraniums having a marked improvement in the flowers.—July 20, 1877."

"Cricket Gardens, July 4, 1877.

"DEAR SIR,—I feel great pleasure in sending to you the result of my experience with the Manure you sent to me for trial. I selected four plants, equal in size, of the following sorts:—Geraniums, Fuchsias, French Beans, Cucumber, Balsams, Cockscomb, &c.; two of each sort I potted with a mixture of your Manure, and two of each sort I potted in the usual good soil generally used for such plants. It was quite wonderful to see the difference in the habit and growth of the plants where the Manure was used to the other. I have no hesitation in saying it is by far the best Manure I have ever tried for plants in pots.—I remain, dear Sir, yours faithfully, D. D. DAVIES, Gardener to LORD BRIDPORT."

"Mr. WILLS."

"The Gardens, Coombe Lane, Kingston-on-Thames,
June 29, 1877.

"DEAR SIR,—In answer to your enquiry as to the Horn Manure, I beg to inform you that I applied it to some early forced Muscat Vines that have their roots confined in a very narrow inside border, and the result has been a magnificent crop of Fruit, or what appears to a casual observer perfectly exhausted canes.—I am, dear Sir, yours very truly, W. DENNING, Gardener to Lord LONDENBOROUGH."

"The Gardens, Harewood House, August 2, 1877.

"DEAR SIR,—I have had great pleasure in giving the sample of your Horn Manure a fair trial. Having potted a many varieties of Greenhouse and other Plants with the quantity you advised me to do, I have noticed them doing well, foliage healthy and green. I don't hesitate the least in saying, the Manure will become a great acquisition to gardeners when better known.—I am, Sir, yours respectfully, JAS. FOWLER, Gardener to the Earl of HAREWOOD."

"Mr. WILLS."

"Leyton, Essex, June 30, 1877.

"DEAR SIR,—In reply to your letter concerning the Horn Shavings you were kind enough to send me for a trial, I found a marked effect on Fuchsias (the only plants that I could try it on, as the others were all shifted). I believe it will prove a powerful Manure, as the quantity I used was only one-eighth, —With kind regards, I remain, yours very truly,

"Mr. J. WILLS."

"JAMES SWEET."

"Mentmore, Leighton Buzzard, July 3, 1877.

"DEAR SIR,—I consider your Horn Manure a very valuable material for mixing with soils for potting purposes. I have used it for various kinds of plants, and the effect is very apparent in the dark green of the foliage and robust health of the plants, which were potted in soil mixed with your Horn Manure.—I am, dear Sir, yours truly, J. SMITH, Gardener to Baroness ROTHSCHILD."

"To Mr. WILLS."

J. WILLS BEGS TO SAY THAT HE HOLDS THE ENTIRE STOCK OF THIS MANURE.

JOHN WILLS, F.R.H.S.,

Can offer some sorts at unprecedentedly low prices. Any of the following can be supplied at 10s. 6d. each:—

- ACANTHOPHIPPIUM BICOLOR
- ADA AURANTIACA
- ANGULO CLOWESII
- BATEMANNIA COLLEYII
- CATTELEYA INTERMEDIA
- " LEOPOLDII
- " MOSSLÆ
- " WARNERI
- CÆLOGYNE BARBATA
- CLAUDIOSA
- CYPRIPEDIUM BULLENIANUM
- LONGIFOLIUM
- DENDROBIUM ALBUM
- " AMENUM
- " BARBATULUM
- " CRASSINODE
- " CRVSTALLINUM
- " FALCONERI
- " NOBILE
- " THYRSIFLORUM
- " VARDIANUM
- EPIDENDRUM TIGRINUM
- " VITELLINUM
- HÆLIA SANGUINOLENTA
- HOULLETTIA BROCKLEHURSTIANA
- LÆLIA ANCEPS
- " AUTUMNALIS
- " CINNABARINA
- " MAJALIS
- " MARGINATA
- " PURPURATA
- LVCASTE SKINNERI
- MESOSPINIDIUM VULCANICUM
- ODONTOGLOSSUM CITROSUM
- " CORDATUM
- " HALLII
- " HASTILABIUM
- " INSLEAYI LEOPARDINUM
- " MACULATUM
- " CIRRHOSUM
- " ROSEUM
- ONCIDIUM AURIFERUM
- " AUROSUM
- " CRISpum
- " FUSCATUM
- " LEUCOCHILUM
- " MARSHALLIANUM
- " ROSTRANS
- " STELLIGERUM
- " TIGRINUM
- " YARICOSUM
- " ROGERSII
- PHALUS GRANDIFOLIUS
- PLEIONE LAGENARIA
- " MACULATA
- " WALLICHIANA
- SACCOLABIUM BLUMEI MAJUS
- STANHOPEA SHUTTLEWORTHII

And any of the following at 7s. 6d. each:—

- AERIDES WARNERI
- BRASSIA VERRUCOSA
- CALANTHE VESTITA LUTEO-OCULATA
- " RUBRO-OCULATA
- CÆLOGYNE CORRUGATA
- CYPRIPEDIUM BARBATUM PURPUREUM
- DENDROBIUM BENSONIÆ
- " JAPONICUM
- " PIERARDII
- LÆLIA ALBIDA
- LIMATODES ROSEA
- MESOSPINIDIUM SANGUINEUM
- ODONTOGLOSSUM GRANDE
- ONCIDIUM CÆSIUM
- RODRIGUEZIA SECUNDA
- SACCOLABIUM AMPULLACEUM

New Ivy-Leaved and Hybrid Ivy-Leaved Pelargoniums, with Double Flowers

- BIJOU, an extremely attractive hybrid, producing large trusses of full double flowers of a rich bright scarlet colour. 10s. 6d.
- EMBLEM, a beautiful hybrid, with pretty double flowers of a cerise-pink colour, slightly shaded with salmon; light centre. 10s. 6d.
- FINETTE, bluish white, the upper petals flushed with rose and feathered with dark crimson; a very fine, large and distinct flower. 7s. 6d.
- GAZELLE, delicate bluish with light rose tint; upper petals feathered with crimson; a very full double flower. 7s. 6d.
- IONA, soft lavender with white centre, upper petals marked with purplish crimson; a large and beautiful flower. 7s. 6d.
- MARSHAL, rich rosy cerise; a most attractive hybrid variety, producing fine double flowers. 10s. 6d.
- NORMA.—A distinct variety, giving fine flowers of a deep lavender-pink colour, the upper petals barred with violet-crimson. 7s. 6d.
- ONDINE.—A very fine large flower of a soft rosy pink colour, the upper petals feathered with bright carmine. 7s. 6d.
- RENOWAN.—A magnificent hybrid, producing fine double flowers of a rich rosy carmine colour shaded with scarlet; exceedingly showy. 10s. 6d.
- ROSETTE.—Soft rose shaded with mauve; a beautifully formed large rosette-like flower; the plant is of compact habit and very free blooming. 7s. 6d.
- SERAPH.—Light mauve-pink, the upper petals beautifully barred and feathered with rich dark crimson; flowers very full and double. 7s. 6d.
- VESTA.—Fine large double flowers of a very delicate bluish pink colour, the upper petals rayed with purplish crimson. 7s. 6d.

From the COURT CIRCULAR, September 1, 1877.—"Sutton's Autumn Catalogue of Flowering Bulbs is one of the neatest and prettiest books of the kind yet published, and contains a vast amount of valuable information on the cultivation of bulbous flower roots, which is sufficient to commend it to the notice of all who are fond of floral beauties. Messrs. Sutton & Sons, the Queen's Seedsmen, have long enjoyed the enviable reputation of standing in the foremost rank of floriculturists, and the painstaking care evidenced in the production of this year's catalogue deserves the warmest commendation."

FRUIT.

IN continuation of our remarks at p. 295 it may be said that in respect to fruit culture under glass, if we go back even no further than the commencement of the present century, there has been a great advance both in the improved character of the structures in which it is grown and the immense increase in the quantities produced.

With Pines, the heat at command frequently consisted solely of dung linings for successions, wherein they lingered on, making little progress through the winter, with the fruiterers in the central pit of a dark lean-to house, often still further darkened by Vines overhead, the leaves weak and drawn up, and the fruit frequently taking a couple of years before arriving at maturity from the time the small suckers usually employed were put in. Subsequently Hamilton's system came into fashion, and then planting out was adopted by many, but the majority of growers have now returned to pot culture. In all cases the great improvement that has taken place in the construction of Pine-houses, and the still greater advance in heating them, has made Pine growing a very different affair from what it once was. Growers have so far learnt the advantage of allowing the suckers to acquire plenty of strength before taking them off, and of keeping their plants going, that Pines are now produced in twelve or fifteen months superior to those that used to take nearly double the time. The collective weight of fruit from any given number of plants, fair representatives of modern Pine growing, is also no doubt much greater than it used to be.

Vine culture under glass from the first was more in accordance with the natural requirements of the plant than was the case with Pines. From the fact of their being trained up near the glass they were in a position to receive that most indispensable of all elements to vegetable life—light. The general estimation in which the Vine, above all other fruit-bearing plants, is held has naturally caused more study and attention to be paid to its general requirements. Its wants have long been fairly understood, although from what has been achieved of late years he would be a bold man who would say that there was nothing more to be learnt in Vine culture. Speechly's bunch of the coarse Syrian, grown at Welbeck, was for well nigh a generation held up as the crowning evidence of what it was possible to accomplish in the way of big bunches, yet we have seen his weight a long way beaten with the naturally smaller-bunched Black Hamburg; and though we cannot look upon these enormous bunches, invariably deficient in finish, as the highest evidences of skilful Grape growing, still they unmistakably point to the fact that those who produce them have hit upon a mode of treatment that imparts to the Vine a combination of powers, without which these monster bunches could not be produced. The late Dr. Lindley used to frequently urge fruit growers to further exertions by reminding them that they did not keep pace with the plant growers in the improvement of their productions. In this he lost sight of the fact that very much more study and attention had been paid to fruit growing under glass, and a higher standard of cultivation arrived at for half a generation before more was done in the way of plant growing than merely

keeping them alive, consequently there was not the same room for the improvement in fruit. It is not through any sensational advance but by the production of Grapes in medium-sized bunches, more perfectly finished than they were met with in times past, that the great progress in Grape growing consists. It is shown also in the large number, now to be met with in most parts of the kingdom, who can grow this fruit well.

The cultivation of Peaches, Nectarines, Figs, Strawberries, Melons, and Cherries, like everything else grown under glass since this article became cheap, has increased to an extent that previously would not have been credited as possible, and the general standard arrived at in the growth of these fruits has equally improved. The better varieties of Plums now frequently met with in splendid condition, the result of indoor cultivation, are also an acceptable addition to the dessert-table.

Within the last thirty years a great number of new varieties of fruit have made their appearance, amongst which a few acquaintances so very old and almost forgotten that it would have been refreshing to have again seen them had they been content to appear under their old names, but when they have ushered themselves before us, re-christened, the interview has been somewhat perplexing. Of the new kinds, as might have been expected, the majority have not turned out equal to the high character with which they came before us; but a few have been proved to be decided acquisitions. Amongst Pines Charlotte Rothschild is no doubt an excellent and most desirable kind, and an acceptable addition to this so-called king of fruits. In Grapes, Madresfield Court, as an early (not a late keeper as it was first said to be) is equal in quality to its good looks, and is deserving of general cultivation; Lady Downe's and Alicante have both become established favourites for late keeping, and are too well known to need any comment. As to most of the newer varieties, if their good properties outweigh their defects they will ultimately make their way. In Peaches and Nectarines the greatest gain has been in a few of the early varieties of both home and American origin, which are no doubt improvements, taking quality, appearance and bearing capabilities into account. Amongst Apples, Pears, Plums, and Cherries, the gain in any new kinds that have appeared during late years is doubtful, taking all properties into consideration and comparing them without prejudice with the large number of good sorts that are well known and proved. Of Apples that have become more generally known of late years, although there may be some doubts as to how long they have been in existence, Lord Suffield and Ecklinville Seedling are deserving of all that can be said of them. The same applies to Doyenné du Comice Pear, of which it would be difficult to speak too highly.

Every year brings out new Strawberries, both home raised and foreign; but very few of them, after being fairly tried, have succeeded in establishing their superiority over older, well-proved varieties. In bush fruits there has been little advance. Lee's Black Currant we believe to be a very good useful sort, that most likely will supplant the older kinds.

The above enumeration of fruits of comparatively recent introduction will no doubt to many appear a very meagre affair, but there is only one safe way of estimating these new-comers, that is, by putting their collective properties in comparison with proved kinds. *T. Baines.*

LANCASHIRE SHOW GOOSE-BERRIES.

THERE are many parts of the kingdom where the conditions of both soil and climate are much more favourable for gardening than any Lancashire can boast of, yet in no county has there been evinced such a general inclination to excel in the growth of some one or other of the many outdoor productions of the garden, the cultivation of which are within the reach of the toiling portion of the community, as exemplified by the hundreds of artisans and others who have spent and continue to spend their spare hours in growing Auriculas, Polyanthus, Carnations, Pinks, Pansies, Tulips, Celery, Onions, as well as many

other things, and last, but not least, big Gooseberries. I have often been asked by individuals connected with gardening pursuits who reside in other parts of the country why the Gooseberry was taken in hand by the Lancashire cottager in preference to other hardy fruits, some of which would seem to be more deserving of his attention. The explanation is very simple. In the manufacturing districts, where these gardening hobbies are most pursued, the soil, and often the climate as well, is not suited to the growth of many species of hardy fruits, and the Gooseberry, coming sooner into bearing, and being more influenced by high cultivation than most fruits, suits the conditions of these gardeners with limited means better than any other. The principal aim of the cultivator is weight, consequently the whole practice is directed to the production of a few large-sized fruit. When the power of the trees is concentrated in supporting from half-a-dozen to a dozen berries each it will be obvious that a much greater size will be attained than when the ordinary course of growing for a crop is followed, just as the immense examples of culinary Pears grown in the Channel Islands are produced by the small trees thinned to a few fruits each. The show Gooseberry trees are kept quite small, generally consisting of not more than ten or a dozen branches trained in a horizontal position from the main stem at some 9 or 10 inches above the ground, the whole tree often being under 2 feet in diameter. Where the land is not naturally good, soil of better quality is brought in and formed into raised beds about 3 feet across, usually supported by boards. As is well understood by cultivators many kinds of fruit attain a larger size for being grown in close proximity to the moist surface of the earth—for instance, dwarf Apples grown goblet shaped on trellises; the lower parts of the branches are necessarily for some 2 feet in a horizontal position, not more than a foot from the ground. The Apples produced from the bottom of the branches so placed will generally be found to grow to a much larger size than those higher up. It is for this same reason that the show Gooseberry grower keeps the branches of his trees closely trained down. In the spring the surface is heavily mulched with rotten manure; to still further keep the top damp, and moisture continually rising from it to the fruit, a thick covering of Chickweed is encouraged to grow so as to almost reach the branches. The fruit swells to a much larger size under the moist exhalation thus secured than it otherwise would do, but, as is well known by any one who has noticed the effect of a heavy shower upon ordinary Gooseberries when ripe in causing them to split, it behoves the grower of show fruit to take means for keeping his berries from getting wet when nearly ripe; for this purpose hoops are fixed over the trees, and to these laths are tied longitudinally, or twine is fixed, to carry canvas or similar material for throwing off the rain. In this matter the fruit needs considerable watchfulness when about ripe, and the story is told of a Middleton silk-weaver who on the night of an impending thunderstorm just before the show laid in bed awake thinking of his Gooseberries, and when the rain did come he rushed out into the garden with the bed-quilt as an additional covering to protect his favourites. Some of the largest berries that have ever been grown have disappointed the hopes of the cultivator by splitting before the time for exhibition came. Some of the largest varieties are shy growers and comparatively shy bearers, and are nothing particular as to flavour; on the other hand, there are some that possess all the properties that go to constitute a good Gooseberry in addition to size.

Amongst red varieties are:—

London	Dan's Mistake
Wonderful	Lion's Provider
Slaughterman	Clayton
Conquering Hero	Duke of Sutherland
Companion	

Green Kinds.

General	Stockwell
Over-all	Turnout
Gretna Green	Shiner
Thumper	Telegraph
Queen Victoria	

Yellows.

Catherine	Stella
Leader	Leveller
Pilot	Railway
Drill	Gunner
Criterion	

Whites.

Queen of Trumps	Snowdrop
Freedom	Antagonist
Eagle	Hero of the Nile
Snowball	Careless
Lady Leicester	

The general routine of cultivation in the case of these show Gooseberries differs little from the ordinary practice, except so far as I have named. They are always liberally fed with manurial stimulants, especially in dry seasons, as any check from a deficiency of moisture would be fatal to their afterwards attaining the requisite size. The branches are usually secured in the horizontal position they have first been trained in, the old wood from time to time cut away and replaced by new as this is produced. *B.*

AMATEUR GARDENING.

MAKING CUTTINGS.—In studying the methods of propagation by cuttings it will be of some use first to consider the peculiar circumstances of the case. We have to deal with a fragment deprived of most of its powers of obtaining food, but which has got to support itself, to heal a wound and put out new roots from these diminished supplies, and to do it pretty rapidly, or the wounded extremity would probably either decay or shrivel and the cutting fail. We want active, rapid growth, and therefore we take young wood, and choose the season of the year when there is most growing power; we sever the cuttings through a joint or beneath a leaf, because there lies the most active circulation, we frequently leave a film of more matured wood at the extremity, because it is less liable to decay than the soft and sappy growths above; and we place the cuttings under glasses or in the shade, that they may not be exhausted by evaporation, and (in many cases) in warmth, to stimulate their growth.

With regard to the choice of fragments, take a small bit (fig. 64). However long the piece may be it will still have only just the same quantity of surface at its base to feed through, and if this does not supply fluid enough the cells will soon be emptied, they will contract for want of the moisture that should expand them, and the cutting, fallen down and flabby instead of upright and crisp, will show what is going on inside. Therefore 2 or 3 inches is commonly enough, or more than enough, and the pieces should be furnished with some healthy leaves to carry on the circulation.

The part of the plant from which the cuttings may be taken varies much. In many soft-growing things, such as Petunias, Dahlias, Pansies, Verbenas, and others, it will do very well merely to take the tip of the shoot. With proper care these will grow so fast that roots will be put out before there is time for decay, but with a large proportion of plants it is better to choose the small stocky shoots growing either near the root or from the sides of the lower branches. Such shoots are to be found in plenty on Fuchsias, Pentstemons, Wallflowers, Antirrhinums, and a large proportion of our perennials, with every qualification for good cuttings—young and growing, yet with a more matured base, without flower, flower-bud, or seed, but with leafage, healthy and moderate in size, and not too much for the power of the cuttings. Flower-stems which are simply such should never be taken, but in such plants as the double Rocket, where the flower-stem is leafy also, and puts out shoots near the ground, this part will do very well for the purpose.

In evergreen exotics the wood should be a little ripened, but the rule to follow is to take the cutting during the growing season.

The roots have got to be formed by the action of the live sap in the cells, and whether they are simply protruded from the cambium region at the extremity of the cutting (fig. 65A), or from a well-defined "callus" (that is, a mass of young cells forming the ring or lump often noticeable at the end of the cuttings about to root, and merely the first stage of the operation (fig. 65B))—or whether, again, as is occasionally the case, they start from the bark of the buried part—if the sap in the cells is not active they cannot be formed, and the cutting will perish.

TO PREPARE THE CUTTING

A few of the lowest leaves should be removed, for if buried in the ground they could not act properly, and might do harm by their decay. All flowers, flower-buds, and seeds should also be cut away, because they would exhaust the supplies, but sufficient leaves should be left to draw up the sap necessary for the plant life; and if the shoot is weakly, it is often best to nip off the top, and when all else has been done the base of the cutting should

be cut cleanly across with a sharp knife below a leaf, or below or through a joint.

Great care should be taken that this clean-cut base is not subsequently injured, or any rough, torn edge left near, which might induce decay. In Heaths this should be especially attended to, where it is recommended to snip off all the leaves that have to be removed with a sharp pair of scissors.

Cuttings of succulent plants, such as Cactuses, Crassulas, and the like, should be put aside for awhile, that the severed extremities may dry. If planted at once, with the sap from the cut cells still running out, they would be very apt to decay. In some plants exuding a deal of viscid juice it answers to put the cutting in at first the wrong way up (leaves and all), with only the severed base sticking out of the ground. The exudation in this way gradually ceases; what remains of it on the end of the cutting may be wiped gently away, and the cutting itself being then planted the right way up, will probably do well.

STRIKING CUTTINGS.

In setting cuttings, the object is to place them firmly in a soil where they will have sufficient food, but nothing likely to promote decay; therefore, there should be thorough drainage, plenty of broken "corks," potsherds, or brick rubbish at the bottom of all cutting pots, and the hole should on no account be stuffed up with a cork, obstructed by a bit of slate put flat over it, or otherwise closed. Above this there should be a layer of broken peat, rough turf, or something that will let water pass away, but not

that cuttings in pots do best planted against the side, so as to have the full benefit of air and water, and what air and water bring with them conveyed to them

FIG. 64.—A CUTTING PREPARED FOR INSERTION.

carried on by the sap currents passing through the cells to the leaves that are working above-ground, either end of the cutting may be planted, for the leaves at either end of the cutting will do the necessary work, and in hollow-stemmed things, such as Honeysuckle, where water is apt to lodge, it is a good plan to cut a moderately long piece and insert both ends, as in fig. 65 B. There is a double chance of success, and sometimes both extremities will escape decay and root.

The variety of methods in forming cuttings or planting them is endless. The cutting, if flexible, may have the extremity curved upwards: it may have vertical slits run up just through the bark to cause greater emission of roots from the cut cambium region; or, again, ligatures may be tightly tied round the branchlet, or a ring of bark may be removed to cause emission of roots at any wished-for spot before separation from the tree, the rootlets being preserved in damp material tied round for their reception, and the "slip," the morsel torn down from the parent plant near the root, with or without a few rootlets belonging to it, and then planted as a cutting, is a form of growing very successful in some hands, but rather bad for the parent stem.

In the treatment of the cutting after planting it must be remembered that the morsel, having little power of supplying itself, should not be allowed to become exhausted by evaporation, and should be induced to make new roots as rapidly as it healthily can.

Therefore we put bell-glasses over cuttings to keep a damp air round them, we shade them from excess

through the porous materials. Though stagnant moisture is ruin to most cuttings, yet such a supply of

FIG. 65.—ROOTING OF CUTTINGS.

allow earth to slip down amongst the drainage, and above, silver sand, or sand and garden earth mixed, or common garden earth, or possibly peat, according to the nature of the plants.

Heaths require, or at least greatly prefer, pure white sand. A large proportion of plants will do well in sand and garden soil mixed; some, as scarlet Pelargoniums, require nothing more than common garden soil, and succulents, such as Sedums, Cactuses, &c., prefer a mixture of brick rubbish, with peat and sand.

Brick rubbish pounded fine answers well by itself for many plants—Heliotropes, Fuchsias, &c—but from its power of absorbing moisture must have extremely good drainage, and pounded charcoal may also serve as a more nutritious substitute for sand; but farmyard manure or anything in process of decomposition should be carefully avoided as likely to cause decay.

The cutting should always be inserted in a hole made for it with a smooth, sharp-pointed stick, and never on any account be shoved down to make its own way through undisturbed ground, risking injury and consequent decay. Except with the very easiest rooting plants) only enough of the cutting should be buried to allow of it being fixed firmly in the ground. The sap has to travel to the leaves before it is elaborated, and there is no use lengthening the journey.

A firm position, however, is quite necessary for the safe rooting of the cutting, or in wriggling to and fro it would probably greatly injure its own rootlets; and unless the earth is packed firmly there may very likely be a cavity beneath where the newly protruded rootlets would wither. It should also be borne in mind

water as may ensure them from flagging will hasten rooting in the case of water-loving plants, and the old-fashioned plan of putting a small pot with a cork in the bottom on the drainage layer in the centre of a larger one, filling in between with the proper soil, and after planting the cuttings in it as usual (fig. 66), pouring water into the central pot, and keeping it

FIG. 66.—CUTTING POT.

supplied till the cuttings are rooted, is simple and successful.

Another serviceable plan is putting the inner pot wrong way up (this time without a cork in the bottom) on the floor of the larger one, filling in between of course, as usual; the hollow up the centre makes a chimney that draws warm air up from the hotbed, and the changing air and moisture appears to do good.

For common purposes it is best to plant the cuttings upright and right way up, but as the circulation is

of sunlight, and we give them warmth, or take advantage of natural warmth of weather to spur on their growth.

A frame on the ground in a neglected corner may be damp and shady, yet do no good for want of warmth; sunlight may kill for want of damp, but, taking the two requirements together, the amateur may root many of his cuttings by the simplest contrivances without the aid of bottom-heat, frames, or other expensive appliances, though these are desirable where they can be procured. He may sink three or four pots in a hole in the ground with a hand-glass over, he may put his cutting-pot at the bottom of another with a large piece of glass above to confine the moisture, or he may put a large pot with a piece broken out of one side as a partial shade to cuttings planted in the ground, and with a little ingenuity he may probably succeed with a large number of plants as well as with the most correct apparatus. The great enemy of cuttings is decay, and, therefore, warmth is desirable to stimulate their vital powers into action, and every decayed morsel or cutting should be at once removed.

Root cuttings sometimes, as in the *Cydonia japonica*, are more adapted for propagation than the branchlets: in this case morsels of the root 2 or 3 inches long and about as thick as a pencil, placed in very slight warmth, and just covered with earth, will root easily. Roses also thus treated will sometimes root more rapidly than the regular shoot-cuttings. Leaves also will form roots from their stems, or from the main rib (as in the Lily), if just notched or broken and laid on the ground, but the operation, except in the case of certain special things, as Begonias, &c., is rather one of curiosity than for practical purposes.

LAYERING.

The layer is merely a cutting attached to the parent plant till its own roots are formed; a cut should be similarly made, slanting a little upwards, beneath a leaf or through a joint, allowing it to run a little way up the stem, and the portion being firmly fixed (by a hooked stick generally) beneath the roots will fall as in the cutting from the cambium region, and the rooted fragment carefully cut off forms a new plant.

In this case it is necessary to take care that the several portions are kept apart, or they might join instead of rooting; and a little bit of wood in the wound or care in pegging down will ensure this, and decay from the slit running on or other cause should be guarded against.

The varieties of detail are too numerous to be entered on here, but if the amateur will bear in mind that he must choose his cuttings and layers in such active life that they may grow, and so husband their resources by shade, preserve them from decay by soil and drainage, and urge them into growth by warmth, he will be able to arrange his own methods of operation with every chance of success. O.

ORCHARD HOUSES: TWENTY YEARS' EXPERIENCE OF THEM.

"*Eheu fugaces!*" The years have indeed slipped by since the inventor of the "ground vinery" and myself, old schoolmates, following the excellent idea of their inventor, became the earliest Orchard-house workers.

Since then, strange to say, little real modifications have been imported into the original idea, and the first old "glass shed," for it was little else, can even now be used with fair profit. No doubt the inventor's first conception had been well-matured before it became public.

On the whole, however, complete and workable as the orchard-house model has become—with, as was said, no material change of idea being introduced—it cannot be considered either as final, nor can it be stated that it has been received without an amount of objection which is hardly realisable. It is not final, because it was not ever supposed to be so, and immense changes have taken place in horticultural ideas during twenty years—everything has developed considerably, and so important in fruit culture are orchard-houses that these must partake of the universal law of progress. Still it has been small—smaller than it ought to have been. Again, some of our very best gardeners have hardly given the subject sufficient attention, and, having such a command of time, means, influence, and opportunities, they might, and I think were expected by the public to, have already made more use of these structures than they have done.

Generally speaking, it is among the class of gentlemen amateurs, and also among those of limited means, that the subject has been most enthusiastically received, and it is here that the best results have followed. The advance in scientific training and pruning, and in the knowledge of suitable sorts of fruit trees hitherto unknown even in name, and in the consequent stimulus given to trade to procure new and, above all, earlier varieties, has been prodigious. Quite a new development of the fruit trade has occurred not only here, but in America and on the Continent, where, but for orchard-houses, the very early Peaches, for example, would not have been raised, for it was for them and in them that they were born and first fruited. Not only so, but even now they constitute the chief item of value of such structures, whose essential quality it is to hold an intermediate space between the old and valuable forced Peach-house and the still older open wall.

ADVANTAGES OF ORCHARD HOUSES.

Our uncertain climate must always necessitate the use of glass, and nowhere is it better employed than in orchard-houses. I consider glazed walls of every description, however well worked, as mere toys compared to a good house of glass. These walls are more costly, cover less area, are subject to more baneful alternations of temperature, are more unhealthy for the gardener, are even less pretty, and are more difficult to manage than their rivals. Glass copings are certainly the best form of such adjuncts to gardens, but even these have many defects.

They require tiffany screens under them, necessitate great care and attention, and are liable to injury in windy localities.

As yet, upright glass walls have not realised any expectations conceived by sanguine inventors, and, as to small peacheries or vineries, well—myself an inventor of several—I must honestly warn amateurs against them, as a rule. This short paper could not be of profit to the general amateur, for whom it is specially written, did it not state the writer's candid experience. And this is certainly one. Avoid all small glazed structures, unless you can devote continual care to them. They are always either too hot or too cold—at any rate they are seldom of a good growing temperature, or of a safe one for mere protection and rest. If they are neglected for a short time during burning heat, everything is scorched up; if they are opened too suddenly, draughts favour mildew. In short, the amount of skill for managing them is equal to what would secure good results in very grand hothouses, and can only be considered valuable as a school of severe training. If an amateur has little else to do, and has them ever under his eye, then they will be useful and serviceable.

HOW TO BUILD AN ORCHARD-HOUSE.

But, in ordinary orchard-houses, all this excessive care is not really needed. Almost any one can make them repay ordinary care. But let the amateur endeavour to get them of a fair size at first, and rather abstain from them altogether than have them too small. At first, twenty years ago, we all thought that, the smaller they were, the better. We also thought mere "glass sheds" of wood, or hedges on one side, were quite sufficient. Both of these ideas proved fallacies. A small glass house heats too rapidly, and also cools too quickly at night. It is also stifling, and if plunged somewhat, so as to economise walls and glass, it becomes a mere pit, unfit for human pleasure therein, and a nursery of red-spider.

The houses must also be solidly built. If not, they become dangerous in storms, and apt to warp. They also, being thin, do not store up any heat for the long winter; and then they require stoves and lamps to save the heat, and few of these are free from objection. Most of the pretty small orchard-houses have gradually been enlarged, much to their advantage. Of course, with increased care they can be made useful. A lean-to house of, say, 20 feet by 12, can be worked with profit, but one of 30 by 12 is much easier to manage. My first house was of this size, and has been good these twenty seasons. It was far too low (only about 4 feet) at the front, and, for this reason, must now be condemned. Potted trees, even plunged, soon reached too near to the glass, and it was impossible to go round them, as the front was so low. The glass was always too broad, and was much injured in our tremendous winter gales. They have, however, survived 45 lb. pressure to the square foot, when the squalls took them aslant. At other times they cracked under only 25 lb. pressure, but this occurred from back currents of air. These last cause most breakage of glass. Open a door to leeward, during a gale, and the chances are that some badly putted pane will break.

On the form and size of orchard-houses there is much of course to be said. I will now describe some which I have found the very best of these. For a lean-to, 13 feet (inside or clear measure) back wall, 6 feet 6 inches for the front, and 15 feet width in the clear; the length about 80 feet or 100 feet; the back wall very solid, the front all of glass except 2 feet, and the ventilators all to open simultaneously; glass ditto in the back wall, sides of glass, with any ventilation thought proper. The height of back wall insures the proper growth of single diagonal cordons of Peaches and Nectarines; these should be in pairs, and arranged as to order of ripening. For the distance between each cordon I used to think 18 inches enough, now I consider 24 inches at least necessary. The trees last longer in this fashion than was once thought. This season has seen the death of the two last of the "original cordons." Having introduced this style of training into England, about twenty-two years ago now, I had till lately the old trees on which my experiments were made, and from which *Cordon Training* was derived. This, the original work on a now well-known subject, was published by me in 1866—the *Modern Peach Pruner* was issued in 1866, and contained later experience. These diagonals have done immense work, and been very successful.

Nothing that I have seen has surpassed, few equal them.

For the central border I have large standards, and conical trees between. This was to save watering, otherwise three rows of tall cones in pots are easily placed in this border. A walk near the diagonals, and one narrower along the front, allows all the access needed. Pots with vertical cordons along the sides. The watering is done by troughs, with openings at every 2 feet, easily closed. These answer well, provided no careless servant rests any heavy pots on them. The front ventilation is easily done by means of leaden weights (2 lb. each) suspended on 6-inch iron points from the top of the frame of each window. This brings the top downwards, and an iron bar with short ropes attached to the lower part of each window by means of a rack and pinion wheel as it slides forward or is drawn back opens or shuts all the windows simultaneously. This plan saves expensive iron bars. No house can be better than such a one, and some fine houses have been modelled on it, especially one by M. André, of Paris.

Another arrangement for a span-roofed house of my design has never as yet been described. Some grand houses are, however, built on this plan. Say a house 120 feet by 30 feet, the sides 9 feet high, and the apex 16 feet; five walks down the whole length, and rows of diagonal cordons between them, and also cordons against the glass sides. Anything would grow thus, and the appearance is very fine.

As to ordinary span-roofed houses, I consider those of Mr. Rivers as of the best dimensions—say, 100 feet by 30. Central standards in the border, and potted trees around them. Walks as you please to place them. In reality this does not matter. Once I thought it did, but experience shows that almost anything will succeed.

WHAT TO GROW IN IT.

Nothing but Peaches and Nectarines should be grown in small houses; all the rest is a mistake. This was an error which I never committed, but which I see many do. If you need Plums, Pears, or Figs, these should be grown separately—on the open wall, or, if need be, be purchased. Plums are very tempting to grow in orchard-houses, and so are Apricots. Pears and choice Apples also bear freely in pots, but unless in very large or in separate houses they should never be attempted. The same may be said of Vines. Even sparsely trained to the rafters they are out of place: either they or the staple (Peaches and Nectarines) must suffer. Cherries and Apricots are impossible, save in immense houses—they need too much air.

I consider the early Peaches to be the especial objects to grow in orchard-houses. By this means you obtain fruit in July, and the open wall then comes in. Again in October the orchard-houses should supply the family or the market. All the above remarks apply well to market-growing, for it is evidently the interest of the producer to grow the finest and the earliest fruit, so he must thin out boldly; far too much is left on. In any locality the earliest Peaches are the best to grow; many now are very fine and large. Nectarines are easier to transport, can be gathered when less ripe, are more prolific; but Peaches always sell well.

I add no list of names, as these are so often and so well given in periodicals, and in treating of orchard-houses I have considered Peaches and Nectarines as their staple. They were meant to grow there, and they are by far the most profitable to cultivate.

HOW TO MANAGE AN ORCHARD-HOUSE.

To conclude, as space forbids enlarging on a charming theme, the main things for the amateur to be positive in his own mind about are—not to overcrop his houses for any consideration, for this is the reason of so many failures; the other matter is to give abundance of water during the spring and summer months. Few people know how much water trees will take in. In the open air they endure days of rain, and it does not hurt them, but the contrary. It is the cold winds, the frosty springs, the sunless autumns, that kill the crop, not the rainfall. Sometimes it does wash away the pollen when the bloom is out, but seldom. No overcropping; plenty of air and of water; constant overcropping.

I have found also by experience that to recommence syringing after the fruit is gathered is proper to do; also that very strong doses of liquid manure can be given for a short period in June and July with advantage. A little water at intervals during the winter is also beneficial. All this may be abundantly known to the

amateur, but the candid recital of a score of years' experience must be of value. I have wavered greatly at times, and returned generally to fixed rules. Among these I have found that rules for pruning and training which appear empirical at times to all of us, have their use, and that is, to recal our minds to certain facts in vegetable physiology long ascertained to be true. At times we grow neglectful of these, but often to find some loss has taken place. For example, I do not consider him a good pruner who does not count his leaves as he cuts the young shoots. *Thomas C. Bréhaüt, Richmond House, Guernsey.*

Garden Operations.

PLANT HOUSES.

GREENHOUSE HARD-WOODED PLANTS.—In the colder parts of the kingdom it will not be safe to leave hard-wooded plants exposed in the open air after this time, as we often get frost more or less about the third week in the month. In the more favoured localities they may be allowed to stay out till towards the end of the month, or even a little later, if there is a temporary covering over them that can be let down at night. Where they can thus be protected from drenching rains and any frost that may occur they are quite as well out. Where there is sufficient convenience Heaths are much best kept away from the general stock of hard-wooded plants, as they will bear a lower temperature with more air. With the Heaths may be placed any others that are not subject to mildew, such as *Eriostemons*, *Polygalas*, *Acacias*, and anything of a similar strong vigorous habit, which, if kept during cold weather a few degrees above freezing, will be safe. So low a temperature as this does not answer for any of the more tender greenhouse stock, which, if all have to be accommodated together, should occupy the warmest end of the house. The whole previous to getting in should be closely examined to see that it is free from insects or mildew. It will be much less trouble to free any that are thus affected before they are placed in their winter quarters than afterwards. In the case of large specimens it will be much better to stand every plant as it is brought in in the position it is to occupy during the winter than to crowd them in anyhow, as is sometimes done when there is little room. The most delicate growing subjects should always occupy the best positions, and in all cases large specimens ought to be so elevated that their heads will not be far from the roof. When not thus placed, as a natural consequence the base of the plants get very little light. The deficiency of light has a certain tendency to prematurely destroy the vitality of the leaves on the lower branches which it is so desirable to retain. Beginners in the cultivation of these plants often appear to rely for success exclusively upon some particular soil in which to grow them. Satisfactory results are, however, quite as much dependent upon attention to the minute details of their general requirements. We frequently, for instance, see one individual succeed, while another will fail under conditions which seem exactly alike. The want of success can only be traced to the not having placed every plant under the full influence of light so far as the house in which it is grown will permit of. Plants of comparatively little value that make quick growth, raised annually or cut down every year, may be arranged under the eye, so as to have the most effective appearance; but with valuable slow-growing subjects this must be a secondary consideration. Though they may not look so well, it is necessary that they be elevated near the roof glass. There are always numbers of things that may be stood during the winter, when little growth is being made, amongst and particularly under them: that will be so much gain in space.

AZALEAS.—The earliest flowered plants will now in most cases be about completing growth and setting their flower-buds, and it is in all cases well to get them tied before the wood is fully hardened up, as after this the leaves, which inevitably get more or less moved from their natural position, have not the power to right themselves before growth is completed. Previous to tying destroy any thrips or red-spider there may be. In the case of the former insect, washing with simple tobacco-water is still the most effectual remedy; and where red-spider exists, an addition of 2 oz. of Gishurst Compound to each gallon of the wash will destroy it. This is a better plan than that of dusting the leaves with sulphur, as it is much more certain to reach all the affected parts, and the danger of the sulphur getting into the soil is avoided. Where these plants are only required for home decoration many sticks are not required. To keep the growth of Azaleas properly balanced at the base as well as at the top, it is imperative that from the first the strong branches be kept tied down towards the bottom, leaving the weaker ones to assume a more upright position. In this there should be no more twisting of the shoots than is absolutely necessary. We frequently hear much said against its being done at all, but where it is carried out so as to keep the strong shoots bent down in the way above indicated near the

base of the plants, the certain result is that as they get older they become naked and bare at the bottom. If Azaleas are intended for exhibition, it is necessary to carry the tying further, but on no account should those wire and wooden trellises which we often see be employed. They give the plants a most unnatural appearance, and there is nothing gained by using them, as the labour involved by this method of training is as much or more than where a moderate number of sticks are used. There should never be an attempt to make the specimens look too big, that is to stretch the shoots out thinly so as to make the plants seem larger than they really are. Even when in bloom they have a meagre appearance, and if to be shown never travel well. Where the flowers are produced as closely as will just permit of their expansion, they will always be found to suffer the least even if conveyed long distances. For home decoration they are equally desirable. The latest flowered plants will in many cases yet be some time before the buds are fully matured. The more plump and prominent condition they attain during the autumn the finer their flowers will be in the spring. In houses so constructed that it may have been found necessary to give a little shade earlier in the season, this should now be dispensed with. The generally poor condition of Azaleas as now exhibited, is due to an insufficiency of light during the time the growth is made and matured, and to allowing the plants to become infested with thrips and spider so that their leaves are permanently injured. Potting soil should at once be got in, both loam and peat. At no season of the year are they in such good condition, or will they so long retain the requisite properties for the roots of the plants as if dug at the present time. I should never recommend more being got in than will last for a year's supply. *T. Baines.*

FRUIT HOUSES.

VINES.—Vines from which it is intended to cut Grapes in April and May should now be ripe and fit for pruning, as they will have to be started early in November. Let all the glass and woodwork be thoroughly cleansed, and painted, if necessary, in order that it may become dry and hard before the houses are closed. If the old mulching has not been removed from the inside borders every particle of loose inert matter must be taken off and replaced with good turfy loam and bone-dust to the depth of 2 to 3 inches. Where the principal roots are established in outside borders they should also be top-dressed as an inducement to the formation of surface-roots, and some kind of covering should be kept in readiness for putting on when a change to wet weather is apparent. Glass lights, if available, best answer the purpose, as they allow sun-heat and air to act upon the surface. The cold unless summer, having been unfavourable, late Grape-houses in which the fruit is still unripe will require steady firing with plenty of air by day to hasten maturity of fruit and wood. Stop all laterals, as young growth after this season only encourages damp and keeps the roots in a state of activity. Remove all laterals and extension growths from intermediate houses as the crops are cleared, but carefully preserve the old leaves at the base of the buds on the fruiting wood. Cleanse the foliage of dust and insects with clean water, and throw open the ventilators. Pot Vines which have been some time at rest may now be shortened back to the required length. Keep the pots protected from heavy rain, and expose the rods to the influence of sun and air. Look over Hamburgs and other thin-skinned Grapes twice a week for decaying berries. Ventilate freely with gentle fire-heat in fine weather, to keep the house close and dry when the atmosphere is charged with moisture. *W. Coleman.*

CUCUMBERS.—As days decrease in length, and the nights become colder, the syringe must be more sparingly used, and then sufficiently early for the leaves to get dry before nightfall. If the plants in pits and frames are still producing sufficient for the demand, all maiden plants now approaching the fruiting state may be divested of young fruit and male blossoms as a means of increasing their strength, but care must be taken that they do not become too vigorous, as many otherwise promising plants go off about Christmas through over-forcing and feeding. Winter Cucumbers, like Melons, should have a sound, sweet soil, rich enough to produce vigorous growth without the aid of manure. When they commence bearing feed well with tepid liquid manure, and crop lightly. Dispense with fire-heat as much as possible, particularly at night, but see that firm, short-jointed growths with some chance of going through the winter are secured by giving sufficient fire-heat to admit of a free circulation of air on all favourable occasions. A night temperature of 70°, with a rise of 10° by day, will answer for the present. Make another sowing for plants to take the place of late Melons, and strike cuttings of eby-seeding favourite kinds. If inserted in small pots, and plunged in bottom-heat under bell-glasses, they soon root, come into bearing quicker than seedlings, and being hardier often stand the winter better. A good stock of light, fibry turf must now

be kept under cover for top-dressing and putting as the plants require it, always bearing in mind that "little and often" is the best rule with Cucumbers. Where extensive growers have to depend upon tan for their bottom-heat, no time should be lost in getting it together to drain and ferment; but if thoroughly sweetened Oak leaves, with a little ammonia from a small proportion of short horse-dung, can be procured for plunging in or planting upon, a most genial atmosphere in which Cucumbers revel will be produced. *W. Coleman, Eastnor Castle Gardens.*

KITCHEN GARDEN.

Autumn-sown Onions, such as the Giant Rocca and the various sorts of Tripoli, should now have particular attention, as it is an important crop, and more appreciated every year. It is not well to let them stand too thickly in the seed-bed. As soon, therefore, as they are large enough for transplanting, they should be partially thinned out, and the thinnings transplanted into beds at 3 inches apart; this will allow every alternate plant to be drawn young in the spring, leaving the remainder to form large bulbs. The seed-beds should have a final thinning in the spring, and the overplus used for the kitchen, or be planted out as the case may require. If required very large for exhibition purposes, the soil must be greatly enriched, well trenched up some time before sowing, and the plants thinned out in the seed-bed to 9 inches apart. Transplanted specimens very seldom acquire the size of those grown on the seed-bed and thinned in time.

The present is a good time to make Mushroom-beds in a sheltered situation out-of-doors. The composition of these beds is an open question, and success may be attained in various ways. The simple requisites are a rather brisk temperature below, having 80° as a maximum, and a moist and temperate atmosphere above. We have had very good success here by mixing up the fresh droppings and the very shortest of the straw from the stable manure, with about one-third of tree leaves, fresh, if possible, frequently turned to bring it into condition, and at the last turning throwing in a few barrow-loads of chopped turfy loam when ready. Throw up the beds in a sheltered place; if under the shade of trees, so much the better. They should be in the form of a ridge, from 4 to 5 feet wide at the base, and about 3 feet high at the ridge. Beat the material down very firmly, and throw some mats over the ridge. Watch well the progress of the heat, and as soon as the rankness has passed off the beds may be spawned and soiled. The soil being well beaten down, cover with mats as before, and after a time add thereto a covering of straw laid on both sides of the ridge, and some of the longest bent over the top of the ridge, and confined in position by a long strand of rope-yarn from end to end along each side of the ridge, and fastened to stakes driven in at each end.

Too much attention cannot now be paid to the earthing-up of Celery, as the forwarder the operation is brought on during fine and dry weather the better for the future welfare of the plants, as we cannot in the autumn always expect very dry and favourable weather for the operation. The haulm of Peas is an excellent material to dry off and keep in reserve to cover the ridges of Celery in severe weather.

Continue the planting out of the various sorts of Endive and Lettuces, and take frequent opportunities of tying-up the latter for blanching when quite dry.

The large breadths of Turnips lately recommended to be sown will now be ready for thinning out, and should have immediate attention to prevent them from drawing up weak. Whether sown in drills or broadcast, from 7 to 9 inches is a sufficient distance to leave them.

The flowering stems of Globes Artichokes should be constantly removed after the heads are cut. On no account let the heads run away to seed, as it weakens the plants very much. It is by some thought to be a good thing to thin out the suckers at this season, and no doubt it may be done with safety in mild localities, but as a general rule spring is the safest time.

The removal of all dead and decaying matter amongst the Brassica family will require frequent attention, as they are not only unsightly but frequently cause unpleasant smells. Every opportunity should now be taken to stir the ground deeply amongst all advancing crops, which will disturb vermin and keep down weeds. Should slugs be troublesome let them have frequent sprinklings of quicklime. Whatever ground becomes vacant now, and which is intended to lie fallow through the winter, should at once be trenched deeply and thrown up roughly, to benefit by atmospheric influences. This is particularly applicable to those plots which in the ensuing season are intended for Carrots, Parsnips and red Beet, all of which require deeply trenched and well pulverised soil, to obtain which in strong soils is a work of time, and is best secured by frequent forkings over in the winter and spring; but deep trenching for other crops besides the fusiform-rooted must not be neglected, and it is well to bear the subject in mind as the season advances. *John Cox, Rallist.*

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY,	Sept. 17—	Sale of Dutch Bulbs at Stevens' Rooms.
TUESDAY,	Sept. 18—	Sale of Orchids, at Stevens' Rooms.
WEDNESDAY,	Sept. 19—	Sale of Dutch Bulbs at Stevens' Rooms.
		Royal Horticultural Society of Aberdeen.
FRIDAY,	Sept. 21—	Autumn Show.
		Crystal Palace Fruit Show (two days).
SATURDAY,	Sept. 22—	Sale of Dutch Bulbs at Stevens' Rooms.

LOOKING upon the vast quantities of FRUIT annually disposed of in the markets of Great Britain, it may appear strange to say that fruit is not appreciated by the mass of the British people; yet such is the case, if we look upon the manner in which it is employed in the alimentation of the population. Vast as are the quantities grown and imported, comparatively little, and that only of an inferior quality, reaches the poorer classes; the bulk of the fruit—all, in fact, that is worthy of the name—goes to swell the vast number of luxuries which are the daily fare of the upper and middle ranks of society. Fruit is thus diverted from its proper and healthy use as food, and made to take the place of an extra dainty upon the tables of the well-to-do.

While the best fresh fruit commands such prices as it now does this must necessarily be the case. What we would wish to see is fruit produced so inexpensively and retailed so cheaply that it might become a portion of every person's daily diet.

The more extensive production of hardy fruits was treated in a recent number of this journal, but no amount of fruit could be of any benefit to the nation at large until the people are taught that fruit partaken of at a proper time of the day, and in due season, forms in combination with other substances one of the healthiest of nourishments for both adults and children. At present, fruit is purchased as something in addition to the daily supply of nutriment. We have not yet learnt, as the greater number of Continental nations have done, to take fruit as part and parcel of our necessary food.

In France, fresh fruit when it can be obtained, dried fruit when fresh is out of season, forms no insignificant item in the daily bill of fare among all classes. *Les quatre mendians* are well known to every school-boy and girl in France, as they form with dry bread a part—and no inconsiderable one—of his or her breakfast or dinner two or three days in the week. *Les quatre mendians*, or four beggars, are Figs, Filberts, raisins, and Almonds, which have received their humiliating appellation from the very low price at which they are retailed. The four beggars are, of course, only used during the winter season when other fruit is scarce. During summer Cherries, Currants, Apples, Plums, Pears, Peaches, and Grapes are abundant, and one or more of these fruits with bread forms a course at the second breakfast and dinner of most French families. Nor do they appear to have paid much heed to the old Spanish proverb which tells us that fruit is gold in the morning, silver at noon, and lead at night, for in Paris an *epergne* of fruit is often stood on the dining-room table, and after a return from the theatre or an evening visit some of this fruit, with bread and a glass of

claret, forms no bad supper. Setting aside the use of fruit at evening meals, which we could not look upon as a beneficial innovation, considering its consumption at such a time as unwholesome as is its general use in England after a heavy, late dinner, it is certain that fruit might enter much more largely into the daily fare of the people with very great advantage, and will doubtless do so when we have learnt to appreciate the different substances forming our daily diet at their proper value, neither too greatly considering their cost, their taste, nor their bulk, save in regard to the amount of nourishment to be derived from them.

Although the amount of food taken, and the physiological conditions necessary for the healthful assimilation of such food is a matter of great moment, we will not discuss the subject here; most of us know that to keep the body in health it is necessary to consume a certain amount of carbon and nitrogen each day. How to obtain these in the most economical and pleasant manner is surely worthy the study of all having the provision and supervision of food supplies under their care.

In the late Dr. SMITH'S *Practical Dietary* are several suggestions for arranging cheap, yet wholesome meals. Subjoined is a table of two meals, showing how much greater an amount of force may be obtained at the same cost. "Breakfast of tea, bread and butter.—Tea, $\frac{1}{2}$ oz.; sugar, $\frac{1}{2}$ oz.; skimmed milk, $\frac{1}{2}$ pint; water, $\frac{1}{2}$ pint; bread, 6 oz.; butter, $\frac{1}{2}$ oz. Amount of carbon, 1081 grains; nitrogen, 46 grains. Breakfast of oatmeal brose, treacle, bread, and bacon.—Oatmeal, 5 oz.; skimmed milk, $\frac{1}{2}$ pint; water, $\frac{1}{2}$ pint; treacle, 1 oz.; bread, 3 oz.; bacon, 1 oz. Amount of carbon, 1990 grains; nitrogen, 88 grains." By increasing the quantity of bread to 8 oz. (pure whole-meal wheaten bread, of course, is necessary), and supplying the place of the various other above-mentioned articles with fresh ripe fruits, as wholesome and cheap, a much more easily-prepared meal could be obtained, and one which most people would prefer during the hot days of summer. Sufficient is now known of the relative nutritive value of our home-grown fruits, while practical experience shows that in their season and at a proper state of maturity they should form a very important part of our daily food.

Children are particularly fond of fruit, and were it given to them during the early hours of the day, for breakfast or lunch, with sufficient pure home-made bread for a meal, it would prove of undoubted benefit to their general health. The prejudice which at present exists against a free and plentiful consumption of fruit arises, among other things, from two primary causes: the common habit of indulging in fruit when a sufficiency of other food has already been taken, and the no less common and dangerous habit of eating fruit before it is nearly ripe, or when it has begun to decay. Any one with the slightest knowledge of chemistry is acquainted with the fact that fruits possess different properties at different stages of their growth; and thus what in a state of perfect development is health-giving and nourishing, may, during its progress towards that stage, prove injurious, if not actually poisonous.

That bread and fruit with a draught of water from some crystal stream, form sufficient nourishment for the human frame in our temperate climate has been testified by history, nor need we turn to the lives of anchorites and hermits alone for confirmation of the truth of this statement. Within our own experience a learned botanist and naturalist, a practical horticulturist and agriculturist, and, above all, an indefatigable pedestrian, would set out on long journeys from home from sunrise until sunset, and frequently, for several days together, furnished in the way of food with

but plain biscuits, or bread cakes, and dried fruits, raisins, Figs, Dates, or French Plums. In England, as little attention appears to be paid to the medicinal as to the nutritive properties of fruit; in France, both are more generally studied, and more universally considered than with us, and fruit in its various forms enters largely into the diet of convalescents, each description being considered and prescribed according to its predominant properties. Vegetables of different kinds are also employed with discriminating knowledge in cases of ill-health, and those who have submitted to the *régime* can speak of the benefits to be derived from the system. Before quitting the subject, we may refer to the vast numbers of Oranges eaten by the Spaniards, it being no uncommon thing for the children of a family to consume ten or a dozen Oranges each before breakfast, gathering them from the Orange groves, where they hang like the veritable golden fruit, which they are metaphorically supposed to be. Such wholesale consumption of what we look upon as a luxury appears to have no ill effect. The testimony of a late eminent physician authorises the use of fruit as most wholesome immediately upon waking in the morning; he, in fact, prescribed such a *régime* to a friend as the only invigorating and permanent cure for indigestion, facetiously remarking that he gave her a piece of advice which, if it were known to his dyspeptic patients, would cost him his practice, as they might prefer so simple a remedy to his professional visits.

WE are glad to learn that the latter days of the CARLISLE SHOW proved more propitious than the opening day. The weather cleared up, and many thousands of people poured into the show from southern Scotland and elsewhere. We need add nothing to the report published in our last, but we think, in justice to the committee, and especially to Sir WILFRID LAWSON'S gardener, Mr. HAMMOND, and Messrs. LITTLE & BALLANTYNE, with whom the idea of holding so great a show originated, and upon whom fell so much of the labour involved in carrying out so large an undertaking, that a full measure of praise should be accorded to them, the more so as all did their best under most trying circumstances. Sir WILFRID LAWSON'S comments on the state of things are worth quoting:—

"There are some gentlemen here," said the hon. Baronet, "who were present yesterday at the luncheon of the International Horticultural Society, and I don't think they will forget that luncheon to the latest day of their lives. There we were shivering under a tent with the rain pouring down upon us with a noise like thunder, our bread was moist with rain, our soup was cold, our salt turned into putty, and our liquor was adulterated with the most pernicious of materials—in many people's eyes—with pure water. It was, indeed, a piteous scene. There was the Lord-Lieutenant of the county scrambling for luncheon under a dripping umbrella; there was the Bishop of the diocese with the water running down his back, bearing it all with the Christian serenity and fortitude one would expect from his lordship; there was the High Sheriff, fallen from his high estate, sitting on a damp bench, and trying to look unconcerned; and last, perhaps I may say the least, there were half-a-dozen members of Parliament more dirty, damp, and disreputable looking than any other six statesmen of equal worth and importance were ever seen before in this world. Then a rumour went round the tent that if the flood continued much longer the Eden would rise, and there was no distant prospect of the Lord-Lieutenant, Bishop and clergy, nobility and gentry, fruit, flowers, and vegetables being swept away in one heterogeneous mass, seething and surging down to that Solway which is under the special protection of my friend, Mr. STAFFORD HOWARD. I am glad to tell you that I afforded a great deal of pleasure to many of my friends. It is impossible to tell you how many people came to me and made this little joke—'Sir WILFRID, there is too much water here to-day, even for you.' I felt happy that I could be the cause of so much innocent mirth to the gentlemen who could indulge in that pleasantry."

— We have received a copy of the schedule for the great SUMMER SHOW of the Royal Horticultural Society on May 28—31 next. We have also received complaints about the opening of this and the Provincial

Show at Preston on a Tuesday. The inconvenience to exhibitors is such that in many cases they will have to send their plants away from home on the Saturday previous and not get them back till the Monday week. In reference to the country show, there is, moreover, a feeling abroad that before hearty support is forthcoming, some assurance that the surplus expected will be really secured as a guarantee fund for future shows is needed; but as yet, on this point, the oracle—that is the Council—has not spoken.

— We learn that on their way to the recent exhibition at Antwerp some of Mr. B. S. WILLIAMS' finest specimens of NEPENTHES were destroyed on board ship by a RAT. Was this a Nemesis-like revenge on the fly-catching, insect-digesting plant, or was the sea-sick rat in want of a pitcher, such as is furnished by the attentive steward to bipeds on similar occasions?

— We learn that a new work on TABLE DECORATION is in the press. Messrs. WYMAN & SONS announce early in October *Floral Designs for the Table*, being plain directions for its ornamentation with cut flowers and fruit, with classified lists of suitable plants, berries, and leaves. The work will be in folio size, and will contain twenty-four original coloured designs (executed in chromo-lithography), showing the best and most attractive method of decorating the breakfast, luncheon, dinner, and supper table at a moderate cost. Descriptive letterpress will accompany the plates.

— From Mr. BARR we have received a flower of LILIUM NEILGHERRENSE 9½ inches long. Much larger flowers might be produced, but the present plant has had no special cultivation but was left to take its chance. For conservatory decoration this is one of the best Lilies, not only from its beauty but from its exquisite fragrance.

— We are informed that Mr. S. TAYLOR, late of Chichel House Gardens, Wimborne, has succeeded Mr. BURNS in the management of the gardens at Loughcrew, Oldcastle, the seat of J. W. L. NAPER, Esq., County Meath, Ireland. Mr. TAYLOR is, we hear, a good plant grower and decorator, and otherwise a clever and enthusiastic gardener.

— The CRYPTOGANIC SOCIETY OF SCOTLAND propose to hold its third annual conference at Dunkeld, on October 10, 11, and 12. The following provisional programme has been arranged:— Tuesday, Oct. 9.—1 P.M. Meeting of Council in City Hall. An excursion will be made after the business is concluded. Wednesday, October 10.—10 A.M. Meet at City Hall, and proceed on an excursion. [The locality for this and other excursions will be fixed according to circumstances.] 7—10 P.M. Conversazione and examination of the "finds" in City Hall. 8.30 P.M. Business meeting. Thursday, Oct. 11.—10 A.M. Meet at City Hall, and proceed on an excursion. 7—10 P.M. Conversazione, and arrangement of specimens in City Hall. Friday, 12.—9 A.M. Arrangement and examination of specimens in City Hall. 2—10 P.M. Show (open to the public) in City Hall. All Fellows of the Society are requested to endeavour to attend the conference. Other botanists are cordially invited to attend. Fellows and others who purpose coming will oblige by communicating with the Secretary. The Council hopes that all Fellows who can will furnish papers and communications, to be read at the business meeting. The show will be restricted to specimens from the district; but novelties from other districts will be very acceptable. The secretaries will be happy to furnish any further information that may be desired. The Society is now prepared to issue a first century of *Fungi Scotici Exsiccati*, which will contain many of the new species and rarities recently discovered. The subscription price is £1 1s.

— COCKROACHES have become so numerous in some parts of France, especially at Rive-de-Gier, that the inhabitants are obliged to resort to extraordinary measures to get rid of them. The gardener's friend, Joey, the toad, is admitted into dwelling houses and permitted to roam about as he pleases. In other parts the people find a more elegant and musical ally in the nightingale, which they raise in numbers and feed almost exclu-

sively on these disagreeable insects. These facts came out on the occasion of one of the members of the French Acclimatisation Society reading a paper on the domestication of insects of this class, referring more particularly to the big American "kakerlac," *Periplaneta americana*. This species is so abundant, it is asserted, in Havana, as to have become a real plague in the houses. And there toads are carefully preserved indoors, and ladies even tolerate them beneath their dresses for the service they render in protecting them from the bite of this voracious insect. We reproduce this anecdote to strengthen our appeal to gardeners on behalf of Joey, whose good services once known cannot fail to be appreciated. He is often very useful in a greenhouse or forcing-house, as well as out-of-doors; and he should be respected and encouraged accordingly. He is of a retiring and reserved disposition, and rarely obtrudes himself upon the notice of diurnal visitors. But if you enter the house at dusk you will find him very active. When Joey discovers, by long acquaintance, that your intentions are peaceful, he shows symptoms of attachment. In some parts of this country toads are very rare, whilst in others they are abundant. If our memory serves us, toads are unknown in a wild state in Ireland. But we have seen them by thousands in some parts of the south of England after a warm shower; so numerous, indeed, that it was difficult to walk without stepping on them. It is marvellous where they all come from, in short, and it has given rise to the superstition that it sometimes rains frogs and toads.

— The following particulars respecting the effects of 12°·6 of frost on some Australian plants may interest some of our readers in the South and West. They were communicated to the French Acclimatisation Society by Mr. NARDY, of Hyères, and refer to a place called Puech Blanc, near Vendres, and are published in the Society's *Bulletin*. During the past winter there was a sudden change from warm growing weather to cold, and the thermometer (Centigrade) indicated a minimum of 7° below zero. This frost came when vegetation was active, and thus its traces were more permanent than they would otherwise have been:—

Acacia dealbata, uninjured	Eucalyptus siderophloia, less tender
" lophantha, foliage damaged	" paniculata, more injured than globulus
Casuarina tenuissima, young shoots killed	" rostrata, badly cut
Eucalyptus bicolor, harder than E. globulus	" tereticornis, very delicate
" collesis, killed	" umrigera, slow grower and very hardy
" cornuta, killed	" viminalis, quite unscathed
" globulus, young shoots frozen, old wood and leaves unhurt	Grevillea robusta, leaves slightly browned
" zoniocalyx, two varieties: one with Poplar-like leaves withstood the cold well; the other, which resembled tereticornis, very much cut	Hakea eucalyptoides, unharmed
" hemiphloia, less tender	" suaveolens, young shoots frozen, older leaves browned

— Mr. ROBERTS, late gardener to Lord BOLTON, Bolton Hall, Yorkshire, has, we hear, been appointed to the management of Baron L. DE ROTHSCHILD'S extensive gardens at Gunnersbury Park.

— Fortunately the PHYLLOXERA is not likely to cause serious losses in this country, simply because Vine-growing is not carried out on a large scale, and therefore it is not difficult to stamp out the insect wherever it makes its appearance. But there seems every chance of our having to suffer from the incursion of the ten-striped beetle which has committed such ravages on the other side of the Atlantic, if our climate will suit its constitution. Certain people seem to have conceived a morbid desire to possess this plague of an insect in a living state, and our obliging cousins send them over by post. Some sent in this way and detected by the postal authorities were quietly done to death before being delivered up to the addresses; but it is too much to hope that they will, in all cases, suffer the extreme penalty before being given up.

— According to a report of the Agricultural Department of Washington, United States, Australian GUM TREES are being extensively planted in the Southern States. General F. STRATTON, of Oakland, has planted 130,000 of these trees, some of which have attained in four years a height of 40 feet, with trunks 1 foot in diameter. Companies have been formed for purchasing land and planting it with Gum trees. Large areas have been planted with the Iron

Bark on the banks of the Sacramento. This species (? *Eucalyptus siderophloia*, as there are several species popularly called Iron Barks) is said to be harder than *E. globulus*. Experiments on a small scale have been made in Texas with little success. At New Orleans, trees 8 to 15 feet high were destroyed by frosts. In Florida seedling Blue Gum grew 5 feet in four months, or on an average more than one-twentieth of an inch per hour. It is thought that the Gum trees will thrive in most parts of Florida. It is to be hoped that this Gum tree mania will not be carried too far, for although these trees are useful, of rapid growth, and will flourish in a soil in which few other timber trees will succeed, they lack the beautiful, refreshing verdure of the majority of the trees of the temperate and sub-tropical regions of the northern hemisphere. It is fortunate that Gum trees will not grow everywhere.

— After working without intermission night and day for a week the first fires were lighted in the new HEATING APPARATUS of the PALM STOVE, KEW. Three of the six new furnaces are now in working order, but much remains to be done.

— The first portion of the Herbarium was moved into the new building at Kew on the 7th inst.

— The freedom with which statesmen of the highest rank, and bearing on their shoulders burdens of responsibility and cares of the most anxious kind in affairs of State, can find REST AND RELAXATION in their GARDENS and amid the peaceful surroundings of their plants, flowers, and other pets, is well exemplified in the life of that most eminent but, alas! now deceased Frenchman, M. THIERS. In the excellent sketch of his life, published in the columns of a daily contemporary, we are told that during his onerous term of office as President of the Republic he used to walk in his garden, holding there informal *leves* of his friends, and visit his greenhouses and his aviary. He keenly appreciated the beautiful in the animal and vegetable worlds, and he tended his flowers as though they were living things. "Tears of joy one day burst from his eyes at Versailles as during the terrible days of the Commune CHARLES BLANC took out of his pocket some tiny pots of Ferns which FONTAINE had allowed him to carry off from M. THIERS' house in the Place St. Georges." These incidents indicate a mind and temperament that could at all times characteristically detach itself from the cares of State and the turmoil of public life to find pleasure and happiness in those surroundings which horticulture so liberally provides. A CINCINNATUS at his plough, and a GLADSTONE with his axe, felling the giant trees that have done their part in vegetable life and are now to serve the more practical uses of humanity, are evidences drawn from modern and ancient history of that capacity to find recreation in the midst of Nature so beautifully exemplified in the life of the greatest and most illustrious of modern Frenchmen.

— It is understood that Sir JOSEPH HOOKER will return from his American trip about the 28th inst.

— The reports of the OLIVE PRODUCE in different parts of TURKEY are anything but satisfactory. From Prevesa we learn that up to the beginning of November the trees seemed to groan under the weight of the fruit, but warm weather having set in shortly after, nearly half of the crop fell to the ground, and in such a damaged condition that many of the proprietors abandoned it altogether. This of course will be severely felt, as the proceeds of the Olive harvest in the production of oil is the principal support of the inhabitants. It is estimated that the whole produce of oil will not exceed 4000 barrels, of the value of £8570.

— There seems to be a good prospect for the more general introduction of ALGERIAN WINES into Europe, for Consul PLAYFAIR reports that the Vine cultivation has been more than usually successful. From 1872 to 1875 the area under the cultivation of the Vine had increased nearly 4000 hectares, the quality of the wine also had much improved. He considers that a new impetus will be given to this cultivation on account of the immigration of French wine growers, many of whom have been ruined by the Phylloxera in their own country, and have consequently established themselves in Algeria.

POTASH FOR VINES.

IN some experiments made by M. Ville at Vincennes, and of which a notice is given in a recent number of the *Révue Horticole*, the importance of potash as a fertilising agent in the growth of Vines is clearly shown. A number of Vines were planted under like conditions, each in a separate plot, divided from its fellows by a pathway rather more than 3 feet in width (1 metre). The whole area covered was 100 square metres, each square metre being planted with one variety of Vine only, each plant thus being at a distance of 1 metre from its fellows. Each square plot received every year the same treatment, except as to manure. One plot was treated with the complete manure, while from each of the others was successively eliminated one of the constituent elements of the manure in question. Thus while the one plot received the complete manure, nitrogen was taken from the second, phosphates from the third, potash from the fourth, lime from the fifth, and one of the plots was left without manure of any kind. This treatment was continued from 1860 to 1875, with the results illustrated in our woodcuts. Fig. 68 shows a Vine which received the complete manure, fig. 69 received the complete manure with the exception of potash, and fig. 67 received no manure at all. The result is sufficiently striking, but the experiments also showed that where potash was applied and the other

fitted to bring out their admirable qualities to the best possible advantage? Five First-class Certificates were awarded, as follows:—Henry Bond, bright lilac, deepening to a glowing tint, of what might best be described as violet-cerise, deeper in the centre of the flower than in the circumference; very fine shaped petal and centre, full substance; a superb flower that promises to be very constant. Louisa Neate, pale apple-blossom on a creamy sulphur ground, a delicate and beautiful flower, of fine shape and substance. Bessie Ford, very soft lilac, deepening to pinkish lilac on the edges, fine outline and centre; distinct and very attractive. Countess, pale ground tipped with bright purple, good petal, but the flowers were somewhat flat and inclined to be coarse; and I think the award must have been a surprise to Mr. Keynes. All the foregoing belong to what is very inadequately termed the "show" class. The same award was also made to one of the most beautiful fancy Dahlias ever raised—Mr. Keynes terms it the best fancy flower he has yet produced—viz., Charles Wyatt, the ground colour a kind of fleshy lilac, striped and flaked with scarlet and crimson; and in regard to size, outline, petal, and centre, all that could

orange-buff, with pale gold on the circumference, good shape and petal; *Admiration*, golden ground tipped with crimson lake, flat, and a little irregular in outline, but promising to be useful as a show flower; *William Dawkins*, pale yellow ground tipped with deep purple-red, wanting in outline, but yet likely to be a useful variety; *Rifleman*, a remarkably striking flower, much too good to be rejected, colour brilliant crimson, with a shaded centre, wanting in outline; and *Enchantress*, really a fancy variety, but shown on this occasion as a pale ground flower, heavily tipped with magenta-purple: the purple tip breaks out into stripes, and then it becomes a fancy—it also takes the form of a pale *Carnation-striped fancy*, in which character it is very attractive.

Mr. Keynes' fancy flowers comprised *Robert Burns*, pale purple ground, flaked and striped with maroon; *Maid of Athens*, dark crimson, tipped with pale red and white; and *Cuckoo*, sulphur ground, tipped and flaked with rosy red, fine substance, but wanting in outline.

Mr. G. Havies, Orpington, Kent, had promising flowers in fancy *Cavalier*, lively brownish buff ground, flaked with crimson, small as shown, but good petal, centre, and outline; and fancy *Magpie*, maroon, heavily tipped with white, small, and appearing as if there was reason to fear coarseness would come with increased size.

Messrs. Rawlings Bros., Rounford, had *Mars*, bright

FIG. 67.—UNMANURED VINES.

FIG. 68.—VINES MANURED WITH POTASH.

FIG. 69.—VINES MANURED WITHOUT POTASH.

elements successively eliminated, the growth of the Vine, and the yield of the crop presented no sensible difference—a circumstance showing that potash is indispensable to the Vine. Other substances may be omitted and yet the Vine may flourish, but, if the potash be omitted, the Vine simply exists without producing a crop, so that after thirteen years the Vines not only produce no Grapes but scarcely any leaves, and those leaves so weak as not to be able to resist the action of the wind or exposure to the sun, and, in consequence, become a ready prey to mildew. Similar experiments have been made with reference to Potatoes, and with the like results.

The use of wood-ashes, then, which contain much potash, is sufficiently justified by both theory and practice.

Florists' Flowers.

NEW DAHLIAS.—It is very probable that never before was such a grand lot of seedling Dahlias raised and exhibited by one man as those Mr. John Keynes, of Salisbury, presented to the notice of the Floral Committee of the Royal Horticultural Society on Wednesday, September 4. Altogether there were sixteen seedlings, all of which bloomed for the first time in 1876, and have been subjected to further trial in the present year, and all proved too good to be rejected. If such splendid development can be the lot of flowers in a season not at all favourable to the production of good flowers, what might they not be in a season

well be desired by a raiser. Mr. J. Wyatt, Mr. Keynes' experienced Dahlia grower, regards this flower as "the finest I ever had to do with, either as a fancy or in a self colour;" and it is, indeed, a most accommodating flower, for it will also come as a beautiful pale purple, and also as a charming lilac self; and in all its characters it is perfect as an exhibition flower. We have at last a fancy flower equal in point of quality to the best show flower yet produced; and so fortune crowns, with well-deserved honours, the declining years of the most successful and genial of English florists. Another beautiful fancy, *George Barnes*, well deserved the First-class Certificate it failed to obtain. It has a bright lilac ground slightly flaked with crimson, with fine build, substance, and petal. It came near to *Charles Wyatt*, and perhaps that was the reason it was not awarded floral honours, but it was sufficiently distinct to merit them. None of the foregoing flowers, as well as the succeeding ones, had been shaded. Let the opponents of "getting up" in the case of exhibition flowers find comfort in this fact. Other show flowers were *Cleopatra*, brilliant pale red, brighter in colour than *Chris. Ridley*; *Empress Maude*, pale ground tipped with bright purple, fine form petal and outline; *Diligent*,

orange-red, small, but looking as if it would make a good flower; *James Willing*, crimson, tipped with very bright purple, good form, petal, and outline; and *O. E. Coope*, a deep shaded crimson self, small, good centre and petal.

Mr. C. Turner, Royal Nursery, Slough, sent *Charles Lidgard*, gold ground, tipped with claret-red, deepening in colour with age, and becoming more dense over the petals, good petal and outline; *Philip Frost*, an orange-crimson self, a little deeper in colour on the circumference, small, but promising; and *Wizard*, a very distinct-looking fancy, bluish ground, edged and suffused with brownish yellow, and flaked and striped crimson, good form and substance, and likely to be seen in much better size and character.

Dahlia cultivators will therefore have a choice of many new flowers, among which are some of undoubted high class quality. "The lumpish and inelegant Dahlia" is a flower of necessarily formal character, but to very many it displays a peculiar beauty that will make it highly popular for years to come. *R. D.*

Natural History.

A PATRIARCHAL BIRD.—In the possession of Mr. Charles Maret, of West Quay, Southampton, is a large white Cockatoo, the age of which is literally unknown. It has been in the possession of the family for more than fifty years, and at that time had the reputation of being a very aged bird, indeed it is currently believed that it is at least one hundred years old. It has now fallen into the senility of age, and is

getting helpless. Not long since it used to call the name of a favoured old domestic, and recognised her freely long after she had left the service of the family. Probably there are few living birds in the kingdom so old as is this one. D.

WASPS.—These obnoxious insects are very abundant this season, and seem to be driven hard to procure food, because of the comparative scarcity of fruit. Although naturally frugiferous, yet they when hard pressed can also be exceedingly carnivorous, as was exemplified in a butcher's shop recently, the owner drawing my attention to the way in which they had scooped out holes in the lean of mutton joints as large as walnuts, being careful in all cases not to touch the fat, and preferring the tenderest and most juicy parts. The meat is not eaten on the spot, but is cut out and rolled as the insect proceeds into pieces as large as peas, and with a load almost beyond their powers they fly off to regale themselves in safety. D.

Home Correspondence.

Soil and Locality.—I have noticed in the *Gardeners' Chronicle* differences of opinion as to the merits of various kinds of fruits and florists' plants, "particularly Roses." My experience leads me to consider that in many instances the difference arises from soil and locality. I have seen fruits (Pears and Apples particularly) vary so much to different places as to be scarcely recognisable; the same with Roses, &c., leading kinds in one place being in a manner worthless in another. I was some time since supplied to order with a number of Roses, from a noted grower: I selected from prize-lists of different shows, where I was certain there was a first-class collection. Many of the flowers I had seen. A great many of these (with me) turned out worthless, and if I were not certain that they were true to name, and that I had faith in the respectability of the person who supplied them, I would consider I was imposed on. Much unmerited censure is passed on nurserymen and gardeners from this cause. The same remark, I find, applies to agricultural produce—locality and soils making great difference. From the reasons I have stated, I think it hazardous to give lists of names of kinds of fruits, &c., recommended as certain to succeed. *John J. Geoghegan.*

Lilies.—If Lily growers in different parts of the country were to record their experiences of the season now drawing to a close, I think we might get some useful hints. I now give my experience. In most years there are disturbing causes which interfere with experiments however carefully conducted, but in this year the 10th of frost in the beginning of May, when many of the Lilies were in strong growth, gave a check sufficient to account for all manner of failures. A well-known nurseryman told me that he had seen even the old white garden and orange Lilies, *L. candidum simplex* and *L. aurantiacum*, cut to the ground. We had a large bed of the hardy *L. umbellatum* without a perfect flower. In most years, at least in the South, I believe almost all Lilies thrive best in shelter and shade; this year this has been especially the case. With us many Lilies, including *L. auratum*, *L. Krameri*, *L. superbum*, *L. canadense*, *L. Martagon dalmaticum*, and *L. Szovitzianum* have flowered well and seeded, where, from their situation, they were kept back and protected from high wind and rain. In other positions they have more or less failed, in some even where vigorous growth has been made both leaves and flowers show injury. *L. giganteum*, which had its lower leaves b-owned by frost, flowered fairly well and has seeded. Having sufficiently looked over our own Lilies, I paid a visit to my friend and neighbour, Mr. McIntosh. In his garden, as is well known, *L. auratum* is grown under the most favourable possible conditions, natural and supplied; the action of the frost can be well studied there, though he has been let off very easily, many of the Lilies are as healthy and beautiful as usual (except possibly to the owner's eye); many others show only a very slight check, and others have suffered severe checks, though I doubt if in any case the bulbs have been injured. The more backward Lilies and those least exposed to the cold winds seemed to be the most flourishing. I hear sometimes from friends who have lately begun Lily growing that they are discouraged; some of their bulbs have made no sign above ground, the growth of others has been weakly, others have suffered from "spot." I should advise in these cases to try again in different positions, to plant where there is more shelter, and in very cold gardens to try on sheltered sunny spots. I believe that in ordinary seasons there are but few Lilies that cannot be grown thoroughly well but little trouble when the right position is once hit on. Not long back in a beautiful garden in the Isle of Wight I saw a

large bed of Lilies in a situation where scorching seemed to be inevitable. Very early Lilies, like *L. longiflorum*, are, except in very favoured situations, likely to be caught by spring frosts; and very late ones, like *L. Wallichianum* and *L. nilgherrense*, bloom so late as to run risk from Autumn frosts. These, therefore, will probably be always the better for some artificial protection, but all other sorts only require a little practice how to grow them (that is, of course, where there is a garden with shelter). The two Lilies we had most trouble with are *L. candidum simplex* and *L. chalcedonicum*, which in many gardens grow luxuriantly with little care or attention. It is, I think, a great fact that with Mr. McIntosh in even such a very exceptionally bad year so many *L. auratum* should have preserved their usual healthy and vigorous growth. *George F. Wilson, Weybridge.*

A New Hyacinth Glass.—We have the pleasure of enclosing to you a photograph of a new Hyacinth glass we have just registered for five years. It combines elegance with utility, and can be used at all seasons of the year (when not used for Hyacinths) as a vase for cut flowers, &c. The rod can be applied to the glass in a moment without hooks or screws, being fixed with a spring outside the cup, thus not interfering with the bulb. The support for the leaves, also the one for the flowers, are made of brass bands, which are flat against the leaves and the stems, thus not bruising them, and they are fixed in such a manner to the rod as to slide up and down at will. The top support is so made that the spike of flower can be put in without any difficulty, at the same time that it is very firm and capable of upholding the largest Hyacinth.

FIG. 70.—HYACINTH VASE.

The fittings have an ornamental appearance. They are made in best flint, blue and green glass, and neatly engraved, as shown (fig. 70). *Stevens & Williams, Brierley Hill Glassworks, Staffordshire.*

Ornamental Fruit.—Perhaps one of the most ornamental of our slurrbery fruits is that of the single-flowered Boursault Rose. The hedges upon wild Roses are well known for their bright red colour; their very abundance has given to them a low place amongst ornamental berries; however, this cannot be said of the long fruits of this variety, of which I send fresh examples. They are very ornamental, produced, as they are, so very abundantly upon old and young bushes alike. They lend quite a charm to our Rose hedges, and sundry luge bushes we possess are bright with them. We are not quite sure whether the fruits themselves are not equal to such kinds as the *Engenia*, *Cape Gooseberry*, *Whortleberry*, and others, which are used exceptionally—more probably for curiosity's sake and variety than for any palatable merits. Speaking of Rose fruit, *Cerarde* has said:—"The fruit when it is ripe maketh most pleasant meats and banqueting dishes, as tarts and such like, the making whereof I commit to the cunning cook, and teach to eat them in the rich man's mouth." *William Earley, Valentines.*

Tomatos.—These are largely grown in the Fulham market gardens. At present they are the principal paying crop, bringing £1 per bushel in Covent Garden, large growers gathering as many as from 70 to 80 bushels per week. They are as highly prized by the Londoner as Mushrooms. The seed is sown early in February in a gentle heat. As soon as fit to handle they are potted singly into small pots, kept pretty close to the glass to keep them from draw-

ing. In April they are again potted into 4 or 6-inch pots, in good turfy loam, with a little decayed manure added to it, grown on stifly during May. According to the weather, they are planted out the last days of May or the first of June, on well-prepared soil, in rows 2½ feet apart and 2 feet from plant to plant. As soon as they begin to grow they are staked with good, stiff stakes, 3 feet out of the ground, to which only one stem is tied. The side shoots are well pinched back, and as soon as the stem gets to the top of the stick it is stopped. They are kept regularly stopped all the season, and when the fruit begins to colour they receive rather a severe thinning of foliage, to let the fruit get all the sun. It hangs all the length of the stakes as thickly as ropes of Onions. This is what is called a great year for Tomatos. They began to ripen about the first week in August. As soon as they show signs of colouring they are carefully cut, and placed in frames under glass till fit for market. This is considered a great assistance to the fruit left on the plants, and it is coloured sooner under the glass than on the plants. The variety grown is known as the Fulham Large Red, and it is a very fine strain. Market gardeners have their own strains of all they grow, and they are carefully selected. In Cauliflowers and Cabbages, when the piece is at its best, it is looked over, and a stake placed beside all the selected ones. *E. W.*

Drosera Flowering.—I have just seen in an old number of the *Gardeners' Chronicle* a letter stating the rarity of seeing a *Drosera* flower fully expanded. This summer I have had this pleasure twice, after long watching. My first attempt at growing Sundews was in Ireland, in July, where I found quantities in blossom, the finest specimens covering the sides of a railway cutting in County Limerick, which ran through a bog—only *Drosera rotundifolia* though, and no flower open. I kept some for three weeks in vain, carefully moving it from window to window with the sun; some leaves I fed with meat throve, but others to which I gave bread and butter turned yellow, and then shrivelled up. My next attempt was in Cornwall, in August, with *D. longifolia*, but I never saw the very large flowers fully open, though sufficiently so for the bright red stamens to be visible. I despaired of further success till I went to the bog one hot day when the sun was hid by thunder-clouds, and there to my delight I found numbers of *D. rotundifolia*, each spike with its top flower wide open; some I observed were more yellow than white. I carefully dug up a fine plant, and placed it, still expanded, between the leaves of a book to form an extempore press. A few days after, when it was again one of those sultry, oppressive days, with an occasional gleam of sun, I saw a flower open on a plant growing in my saucer of Sphagnum, and at about the same hour, i.e., from 11 to 12.30. This I at once drew. Besides the Sundews the bog was covered with *Anagallis tenella*, *Pinguicula lusitanica*, of all sizes—from some with flowers no bigger than a pin's head to large plants with half-a-dozen blossoms, and tiny seedling *Osmundas*; whilst a profusion of sea-lilies, spikes of bog Orchis, Buckbean, and *Asphodel* grew among the Sweet Gale and *Erica Tetralix*. *M. Conybeare, Tonbridge, Sept. 9.*

The Flow of the Sap.—There is one feature connected with the interesting illustration furnished by "A." at p. 309 that seems to bear more closely upon this subject of the flow of the sap than, it would appear, occurred to the writer. Whilst generally supporting the view I put forward a few weeks since, and in his illustrations of the ring Ash trees showing exactly the same results as I referred to in the branch of the Cherry tree, he also assumes that the results of the ringing proves the ascent of the sap of no inconsiderable amount by the bark. Now it is a curious fact if such is the case that that peculiar excrescence-like growth of bark which is seen at the bottom of the upper bark is not seen at the top of the lower bark, and the same is found in all cases of ringing. I further find if a limb of a tree is cut clean off with a knife or saw, 1 foot from the main trunk, it does not callus over but ever remains as cut. On the other hand, if the bark be taken off close to the side of the main trunk, it will in time become covered with new bark, because there is no entire severance between the upper and lower covering. Similarly I have found that having cut clean away the heads of old Apple trees on stems 6 inches in diameter and put in next the ring strong grafts, that if the grafts grew a gradual covering of new bark spread over the surface of the stock, but if the grafts did not take no such results followed even though strong growth broke out below. I infer from this that bark can only be made by the sap that has first passed through the leaves, and that the ascending sap has no constructive power of itself; further, that these facts either tend to show that the sap does not ascend through the bark, but rather by means of the vascular wood, whilst also they tend to show that there is a return flow through the bark, and that the addition of new wood is so furnished. The method by which the operations

of both budding and grafting are done support this view, because it is not the practice to bring bark and bark into contact, but rather wood and wood. If the sap ascended through the bark, we could imagine the work of the operator would be simplified by merely scratching the outer bark, and affixing the bud thereto; but we all know that this mode of budding would result in failure. Although the eye of the rosebud remains attached to the bark, it is yet in reality a portion of the wood, and if the connection of all shoots or branches, great or small, be traced, it will be found that these originate from, or are centred in, the hard wood of the main stem. It would appear that "A." deduces from the gradual diminution of growth above the ring in the bark during the three years his experiment was being tested, that it is proof of the partial ascent of the sap through the bark; but if such be the case, is it not marvellous that not only did the tree above exist, but also continued to make growth of any kind. Could not an explanation be found in the supposition that, because of the cutting off of the descending channels, the sapvessels above the ring become gradually choked, and thus the starved growth? D.

Pines at Orton.—During a visit to Orton Longueville, the seat of the Dowager Marchioness of Huntley, in August, I observed a collection of coniferous trees of fine growth and of great variety. Among others I more particularly noticed the following:—*Pinus ponderosa*, North America; *Picea nobilis*, California; *Picea bracteata*, California; *Torreya myrsinitica*, California. This Pine was bearing fruit in some quantity; at first the fruit is of a green colour, but as it becomes mature it changes to a purplish colour, with a powerful Nutmeg odour. This I observed in the Botanic Garden at Hobart Town, Tasmania, where I first saw it growing and in fruit. *Cedrus Deodara robusta*, Himalaya; *Thuja gigantea*, the Arborvitæ of California; *Pinus Montezumæ*, North America; *Cupressus excelsa*, Gaetmalia; *Pinus Laricio*, Corsican Pine; *Sequoia* (Wellingtonia) *gigantea*. There is a beautiful avenue formed of these noble Californian trees, nearly the whole of which are of some size and in a perfectly healthy condition. *Thuja Lobbi*, California; *Pinus macrocarpa*, California; *Librocedrus decurrens*, which is often confused with *Thuja gigantea*, and although belonging to another genus is closely allied to *Thuja*. *Picea Douglasii*, California; *Picea Pinosapo*, Andalusia; *Pinus lasiocarpa*, California; *Picea cephalonica*, Cephalonia; *Picea Nordmanniana*, Crimea. There were also some magnificent Spanish Chestnut trees in full flower, and in the conservatory a small plant in flower of the "Christmas tree" of New South Wales, the *Ceratopetalum gummiferum*, just commencing to change to a red hue by the persistent calyces. *George Bennett, M.D., F.L.S., &c., of Sydney, New South Wales, Sept. 9.*

Hardy Bulbs.—Gladioli are now within the reach of every one. Varieties which a few years ago were prohibitive as regards price may now be had at so low a rate that these persons wishing to cultivate this plant cannot prefer the objection that the price is a hindrance, and as to cultivation nothing can be more simple. When we have done sowing, generally about May 10 to 15, we trench our ground deeply and manure heavily, planting the bulb thickly. If the weather sets in very dry we occasionally give the beds a soaking of water, and the specimens sent are a sample of our produce, not exhibition flowers, but nothing to complain of. This season has been peculiarly favourable. We have not required to give any water, and for the last fortnight we have been cutting flowers two or three times a week from the same beds for our window, and we shall go on cutting for the next four or five weeks. Where a sufficient quantity are planted you may "cut and come again" for many weeks. Those who cultivate hardy bulbs can begin cutting *Dafnids* in February, giving a succession to May, and then *Lilies* give a succession till the *Gladioli* come in, and these last continue flowering till the frost destroys them. Just now we have our beds of *Tiger Lilies* superb, and our *Auratum* have been flowering since July, and will continue as long as the weather permits, but more on this subject when I can find time. *L. speciosum* has been grand, and will continue for some time. Autumn *Crocuses* have commenced flowering, also autumn *Scillas*. The *Colchicums* are in bloom, and will continue so till the cold weather is too much for them. *P. Barr.*

The Roseless Autumn.—I am glad to discern from the Rev. J. B. Camm's letter that the West of England has fared better in the matter of autumnal Roses than the East; but over large areas of country, as abundantly shown by my correspondence, there has been an extraordinary dearth of Roses this autumn. It is, however, refreshing to hear of so many and so good Roses at a distance. Nevertheless the mere fact of a large grower carrying off 1st prizes at different places, is no proof that Roses are either plentiful or good. I managed to carry off the 1st

prizes at our own local shows—all that were offered in fact (for six and twelve), with creditable flowers; but for one Rose we have been able to cut since July this year we could have cut hundreds in ordinary seasons, and my neighbours are in the same plight. The buds are now showing more freely, and we may have a good show in October, possibly to the endangering of the safety of the Rose trees and bushes. *D. T. Fish, East Anglia.*

The Giant Sawfly.—The insects sent herewith were discovered a few days ago since under a new Brussels carpet that has been down about nine months; some were alive, others were dead. On examining the floor, which is yellow Pine, I found several round holes the size of the insect, in which they were situated. In every case they were found immediately above the Oak sleepers on which the floor is laid; so, if the insects are from the wood, it appears that they come from the Oak. The floor and sleepers were put down new about three years since. Several holes similar to those in the floor are eaten in the carpet. I found two or three fine living specimens in the windows of the same room about a year since. *J. K.* [The insects sent are the same as those figured in our columns last week—*Strex gigas*—whose boring-rod is a marvellous production, but not likely to excite the unmixed admiration of the house-keeper. We can only suggest capturing and killing the insects. Washing the floors with carbolic acid might be of service, taking care that the solution gets into the holes. EDS.]

Fruit Trees.—In looking through a fruit nursery during the growing season, it is particularly interesting, where very large collections are grown, to notice the young healthy trees in large quarters, especially of Apples and Pears. It is quite remarkable to see, as you view row after row, the difference of the habit of growth of the various sorts under cultivation; some are erect and very vigorous, with scarcely a lateral shoot, others bushy and pyramidal. The true and distinctive character peculiar to its kind can be plainly seen; so much so, that an experienced man could detect an incorrect sort. But the most important and principal object I have in making these remarks is to name some of the most prolific and early-bearing kinds that have come under my notice in the young quarters. I have seen in favourable seasons good crops of fine fruit, of Apples, especially those worked on Paradise stocks, Pears (on Quince), and Plums on small trees, but two or three years old. This year it is not the case, being the worst fruit season I ever remember. Plums are quite a failure, Pears nearly so; Apples are better. The following sorts are bearing a good crop, as pyramids worked on the free or seedling Apple stock:—*Manks' Codlin*, *Keswick Codlin*, *Lord Suffield*, *Old Hawthornden*, *New Hawthornden*, *Frogmore Prolific*, *Old Golden Pippin*, *Court Pendu Plat*, *Braddick's Nonpareil*, *Cellini*, *Northern Greening*, *Stirling Castle*. I must here draw particular attention to the last named sort. I consider it one of the very best early cooking Apples grown. It is a regular and most prodigious early bearer. The fruit is of good size, heavy, and solid, and bears carriage well. The tree is a nice healthy moderate grower, and well adapted for bush and pyramid culture. It has never failed to bear large crops for many successive years, and I can, therefore, recommend it to be largely grown, especially for market. It succeeds best on the free or seedling Apple stock, as also does *Lord Suffield*, *Manks' Codlin*, *Keswick Codlin*, *Hawthornden*, &c. Undoubtedly the Paradise stock is the best upon which to work most kinds required for espalier, bush, or pyramid culture, as it produces early bearing, and a moderate growth and fine fruit; but I do not recommend any sort to be worked on it which bears freely when worked on the free or seedling Apple stock, such as the above mentioned, as the dwarfing and fruiting influence of the Paradise stock on such free-bearing sorts dwarfs them too much, and the trees become stunted and the fruit small; at least I find it so here. *G. Cannon, Lee's Nursery, Ealing, Sept. 12.*

Foreign Correspondence.

SPRING ON THE EAST COAST AND IN THE NORTH OF SPAIN (continued from p. 688, vol. vii).—On May 17 I left Palma, in the afternoon, on a fair-sized steamer, arriving at the port of Valencia, two miles from the city, at mid-day on the 18th. The sea was very calm. On board we had 200 or 300 soldiers, whose dress presented an example of all but inconceivable folly. They wore, one and all, fashionable boots with heels 2 inches high! When walking the body was necessarily thrown on the toes and the knees bent. I subsequently saw several companies of soldiers marching, knees bent, in Valencia, wearing these same foot-destroying boots, a perfectly ludicrous sight.

I had previously visited Valencia in May, 1869, and have described the spring vegetation of the city and its vicinity in my work, *Winter in the Mediterranean*. I once more turned my steps to the Botanic Garden, and surveyed it with care, only to find previous conclusions confirmed. As I have stated, the garden appears to be viewed and managed more as a pleasure garden than as a scientific establishment. The plants and flowers I found on May 6, 1869, I again found on May 18, 1877, only more advanced. They are the common English garden flowers of June and July—monthly and Bengal Roses, with a few hybrid and Tea Roses, Delphinium, Antirrhinum, Iberis, Iris, Stocks, Silene, Jasminum revolutum, Ranunculus, Eschscholtzia, Sweet William, Verbena, Spirea, Habrothamnus, Pæonies, Nasturtium, Pinks, Carnations, Aquilegia, Petunia, Collinsia, Viburnum, Convolvulus major and minor, Tritonia crocata, oak-leaved Pelargonium, Virginian Stock, Aubrietia, Hydrangea. On the more sheltered spots of the Genoese Riviera all these plants flower in April.

There was a glass house, in which I found *Bougainvilleas*, *Lantanas*, *Vincas*, *Heliotropes*, *Palargoniums*, *Cinerarias*, and *Coleus*, all of which grow in the open air, anywhere, in my Riviera garden. In this glass-house were also the Palms and Cycadaceæ which are generally grown in the open air on the Riviera, with the exception of some large *Chamærops humilis*, a *Phoenix leonensis*, 15 feet high; and some large *Latania borbonica*, planted out in a sheltered spot, and flourishing. The glasshouse contained *Corypha australis*, *Caryota*, *Dion edule*, *Thrinax*, *Cycas revoluta*, *Cordylines*, *Dracænas*, *Yuccas*, *Ficus repens*, *Pereskia*, *Aralia*, *Philodendron*, *Russelia juncea*, *Cyperus alternifolius*, *Bananas*. There were *Athutians* and *Oleanders* in the garden, the former in flower, the latter with large flower-buds.

The garden contained many fine specimen trees and shrubs, a *Yucca filamentosa*, 18 feet in circumference; a *Podocarpus latifolius*, 30 feet in circumference; a *Sophora pendula*, also 30 feet round; *Cupressus Toarnerfortii*, 50 feet high; very fine *Acacia lophantha*, and a bush of *Plumbago Lurpentæ*, 30 feet in circumference. In the public market, which I always visit in foreign lands, the vegetables were Peas, broad Beans, Onions, Potatoes, Tomatoes, green Salad, Artichokes; the fruits Oranges, Apricots, small, poor, grown on standards; and Lequats, with a few small and poor Cherries.

The principal cut flowers were white Lilies and Carnations, with both of which the market was supplied in profusion. The Spanish seem to have a perfect passion for Carnations, which the women wear in their hair, the men in their button-holes. In May they are seen in profusion everywhere—indeed Carnations, growing in all kinds of old pots and pans, adorn nearly every balcony or window.

In the gardens of the squares were some very fine specimens of the *Araucaria excelsa*. This tree seems to flourish in all the milder and more sheltered regions of the Mediterranean near the sea, and will eventually contribute much to their ornament.

The above botanical and horticultural facts lead unmistakably to the conclusion that Valencia is a colder winter climate than the more sheltered parts of the Genoese Riviera, from Nice to San Remo. Evidently the cold winter winds fall down upon it from the mountains that shelter it north and west.

On May 19 I left Valencia by rail for Castellón, a town some 30 miles distant, on the eastern shore, where I intended to sleep. The railway runs parallel to the coast, but generally a few miles from it, through a delta-like plain, bounded at its base by the sea, and on its two sides by mountains.

Very little rain falls on the east coast of Spain, its renowned fertility being confined to the valleys and to their outlets, through which rivers come from the mountains of the interior. These rivers are generally, or all but entirely, used up for irrigation during the greater part of the year. Thus, I have twice in May visited Valencia, and found no water at all in the wide river-bed, spanned by bridges of a dozen arches. Irrigation had absorbed it all. Where there is no irrigation-water accessible, the land is all but uncultivable—a mere waste or scrub.

The first few miles from Valencia we were still in the far-famed Vega, or Valley of Valencia, which, thanks to abundant irrigation and to the southern sunshine, produces several crops each year, and is really a market garden. The crops then growing were Beans, Onions, Artichokes, Vines, bearded Wheat,

yellowing; Potatos, Mulberry trees, pollarded, despoiled of their leaves for the silkworms; Pomegranate trees near houses, with a few solitary Date Palms here and there. Then we passed through a rocky limestone ridge, and entered the delta plain of Castellón, which with its protecting mountains is well seen in the panoramic map of Spain in my work, *Winter in the Mediterranean*. This plain, irrigated by mountain streams, is a forest or orchard of Orange trees, and I was thus able to study the conditions under which the Valencia Oranges are grown. *J. H. Bennett, Mentone.*

(To be continued.)

Reports of Societies.

Alexandra Palace: September 13, 14, and 15.—The autumn fruit show, which opened here on Thursday last, proved to be one of the best metropolitan exhibitions that we have seen for the last year or two. Most fruits are well represented, and the more hardy kinds especially so. Vegetables, too, are a thoroughly good show, though not very extensive; and cut flowers, especially Dahlias, are a very fine feature. Amongst the Dahlias, Mr. Keynes came out in fine form; and in the fruit department the remarkable feature was the wonderful manner in which Mr. Coleman, of Eastnor, came to the front.

FRUIT.—Three capital collections competed in the class for sixteen sorts of fruit. Mr. Coleman, gr. to Earl Somers, Eastnor, had first-rate dishes of Muscat of Alexandria, Black Hamburg, Madresfield Court, and Lady Downe's Grapes; large Eastnor Castle and Golden Gem Melons; fine fruits of the Smooth and Black Cayenne Pines. Splendidly-coloured Early Crawford and Violette Hative Peaches, and Pine-apple and Oldenburg Nectarines; good Brown Turkey Figs, Green Gage Plums, Morello Cherries, and Pitmaston Duchesse d'Angoulême Pears. Mr. J. H. Goodacre, gr., Elvaston Castle, had a nice fruit of the Smooth Cayenne Pine, good Alicante, Foster's Seedling, and Muscat of Alexandria Grapes, Apricots, Cherries, finely-coloured Violette Hative Peaches, Jargonelle Pears, Victoria Plums, &c. Mr. T. Bannerman, gr. to Lord Bagot, Blithfield, included beautiful samples of Gros Colman and Black Hamburg Grapes, and also one of Duke of Buccleuch, good Queen and Black Prince Pines, a splendid dish of Barrington Peaches, another good one of Morellos, Brown Turkey Figs, and of Williams' Bon Chrétien Pears, &c. The prizes were awarded to Mr. Coleman, Mr. Bannerman, and Mr. Goodacre, in the order named. Only two competed in the class for twelve sorts—Mr. J. Neighbour, gr. to G. Wythes, Esq., Bickley, and Mr. G. Rushmore, gr. to Sir C. R. Rowley, Bart., Tendring Hall, Stoke. The first-named, who took the 1st prize, had small but clean and nicely finished samples of Black Hamburg, Foster's Seedling, and Muscat of Alexandria Grapes, Peaches and Nectarines, Plums, Pears, Figs, a scarlet-fleshed Melon, and white Currants. Black Frontignan Grapes, Morello Cherries, Violette Hative Nectarines, Bellegarde Peaches, and Brown Turkey Figs were the leading sorts in the second collection. There was only one collection of twelve sorts, and that came from Mr. Cox, gr. to Earl Beauchamp, Madresfield Court, to whom the 1st prize was awarded. All the sorts staged were of good quality, but especially so in regard to dishes of Crawford's Early Peach, Goliath Plums, Downton Nectarines, Morello Cherries, and Jargonelle Pears.

The three classes for Pines brought out sixteen fruits of a fair order of merit. In the class for two Smooth Cayennes the 1st prize was withheld; the 2d being awarded to Mr. C. Ross, gr. to C. Eyre, Esq., Welford Park, whose specimens weighed together 14 lb. 13 oz. The best pair of Queens, handsome fruits, weighing collectively 8½ lbs, came from Mr. J. Churchfield, gr. to H. Littleton, Esq., Westwood House, Sydenham.

The display of Grapes was a very good one. The 1st prize for a collection of eight varieties went to Messrs. Lane & Son, Berkhamstead, and the 2d to Mr. Wildsmith, gr. to Lord Eversleigh, Heckfield Place. These were the only collections staged. The Messrs. Lane had exceedingly good bunches of Pearson's Golden Queen, Muscat of Alexandria, and Buwood Muscat, Gros Colman, and Trebbiano, the other sorts staged being Muscat Hamburg, Alicante, and Black Hamburg. The 2d prize collection was not so large nor so well coloured, with the exception of Black Hamburg, a fine bunch in all respects. Foster's Seedling, Barbarossa, White Tokay, and Muscat of Alexandria were the finest of the others—and very good too.

Seven good collections competed in the class for four sorts, and the 1st prize went to Mr. Coleman, who had splendidly finished bunches of Madresfield Court, Black Hamburg, Muscat of Alexandria, and Lady Downe's. Gros Colman and Black Hamburg were splendidly shown by Mr. Bannerman, who came in 2d. The best of nine dishes of Black Hamburgs

came from Mr. Coleman, whose bunches were fine in size, very compact, and the berries well coloured and carrying a beautiful bloom. The finest of five samples of Buckland Sweetwater came from Mr. James Bain, gr. to Sir C. Rouse Boughton, Bart., Downton Hall, Mr. Miles, gr. to Lord Carrington, and Messrs. H. Lane & Son, all being of good quality, though not large in bunch. Three dishes only of Madresfield Court competed, but they were all good except in the point of colour, and the awards went in the following order—to Mr. Chard, Cleveland Park Gardens; Mr. Charles Tyler, gr. to R. Gosling, Esq., Hassobury, Bishop's Stortford; and Mr. W. Toomer, gr. to W. Knowles, Esq., Ribblesdale, Streatham, Surrey. Three large, compact, and well-finished bunches of Black Alicante, contributed by Mr. J. Freeman, Beechwood Park, Dunstable, were the finest in a very good class for that variety. The Lady Downe's class was a good one, and the 1st prize lot, from Mr. W. Wright, Thurlstone Lodge, Whitton, Ipswich, though small in bunch, were nicely finished and finely coloured. The Muscat of Alexandria class was an exceedingly good one. Mr. Coleman again came in 1st with very perfect bunches of good size; and Messrs. Lane & Son came in a close 2d, their bunches being larger than Mr. Coleman's, but not so well ripened. The classes for single bunches call for no special comment, and we need only say that Mr. Wildsmith was 1st, with Black Hamburg; Mr. Thomas Taylor, gr. to J. Johnstone, Esq., Upper Terrace House, Hampstead, with Foster's Seedling; Mr. J. Peed, with Madresfield Court; and Mr. J. Peed again, for Black Alicante. The finest-flavoured black Grape was Black Hamburg, shown by Mr. Bannerman; and in the corresponding class for whites, Muscat of Alexandria, shown by Mr. W. Coleman, was 1st. The heaviest black bunch was one of Barbarossa, weighing 5½ lb., shown by Mr. J. Peed. The heaviest white was a bunch of White Nice, weighing 6 lb. 14 oz., shown by Mr. Wildsmith. Mr. Coleman had the best basket of 12 lb. of black Grapes, and the same of white—a grand lot of Muscats.

Out of eight dishes of Peaches, twelve in a dish, the finest sample was one of Princess of Wales, a fine white fruit, shown by Mr. C. Haycock, Barham Court, Maidstone; and in another class, for six fruits, the best was Royal George, exhibited by Mr. Thomas Toomer. Pitmaston Orange, shown by the last-named, was also 1st in the class for twelve Nectarines; and Mr. Coleman was 1st for six with the same variety in high condition. The best of nine dishes of Figs was contributed by Mr. W. Chisholm, Boughton Place, near Maidstone. Mr. Pragnell had the best Jefferson Plums; Mr. G. Murrell, gr. to A. R. Allerston, Esq., Coleman's, Prittlewell, the best Kirke's; Mr. James Fry, gr. to L. J. Baker, Esq., Haydon Hall, Eastcott, the best Green Gages; and for twelve of any other sort Mr. C. Haycock came in 1st with Transparent Gage. Mr. James Bain showed the best scarlet-fleshed Melon—a nice fruit of Reid's; and Mr. W. Holder, gr. to W. Balston, Esq., Springfield, Maidstone, sent the best green—the old Bromham Hall. The competition was very strong in both classes.

HARDY FRUITS, as represented by Apples, Pears, Plums, &c., were shown in considerable quantity, and considering all things, the season especially, there was much of good quality amongst them. Mr. Jones, gr. to Her Majesty the Queen, Frogmore, contributed a very fine collection of Apples and Pears, consisting of sixty dishes of the former, and thirty-six of the latter. Messrs. Paul & Son, the Old Nurseries, Cheshunt, also sent a superior collection of Apples, including about eighty dishes, three fruits in each. The same firm also contributed an interesting collection of dwarf Apple trees, all bearing fine crops of fruit. Amongst the prize winners in the classes for Apples and Pears of various kinds we noted Mr. W. Holder, Maidstone; Mr. Coleman, Eastnor; Mr. C. Haycock, Maidstone; and Mr. C. J. Goldsmith, gr. to H. T. Lambert, Esq., Sandhills, Bletchingley. The best collection of twelve sorts of Pears came from Mr. C. Haycock, and the same exhibitor was also 1st for six and twelve dessert Apples. For six sorts of baking Apples Mr. C. J. Goldsmith was 1st.

VEGETABLES were remarkably well shown as regards their quality, and fairly so as to quantity, the whole display being a very creditable one. There were seven collections of sixteen sorts, and the 1st prize went to Mr. Pragnell, gr. to G. D. W. Digby, Esq., Sherborne Castle, who had finely-developed, smooth, and cleanly-grown examples of Parsnips, Celery, Cauliflower, Early Nantes Carrots, Model Potatos, Scarlet Runner Beans, fine white Spanish Onions, Tomatos, Ne Plus Ultra Peas, Vegetable Marrows, Cardoons, Veitch's Improved Beet, Cretan Leek, Sutton's new white Turnip, and a fine lengthy brace of Tender and True Cucumber. Mr. Oliver Arkell, gr. to A. J. Skinner, Esq., Cheltenham, and Mr. G. T. Miles, were respectively 2d and 3d. Nine collections of six dishes came into competition, and a capital lot of produce was shown. Mr. W. Iggulden, gr., Orsett

Hall, Romford, came in 1st with large Globe Artichokes, Cauliflowers, Intermediate Turnips, Snowflake Potatos, Veitch's Perfection Peas, and Hathaway's Excelsior Tomatos. Along with the vegetables were two or three excellent collections of salads, and the prizes in this class went to Mr. Hepper, The Elms, Acton, Mr. Pragnell, and Messrs. G. Smith & Son.

DAILLIAS were much better than might have been expected, considering the persistent wet weather and the dull sunless days. The flowers in the winning stand in the class for forty-eight varieties were large, clean, symmetrical, fresh, and well coloured. This came from Mr. John Keynes, nurseryman, Salisbury, and included grand blooms of Bessie Ford, Charles Wyatt (as a crimson self), Miss Lae, John Bennett, Vice-President, Ovid, Royal Queen, Ethel Newcome, George, Good Lad, James Service, seedling bright dark red, a very fine show flower; Lady G. Herbert, Leah, Prince Arthur, a fine yellow self; Henry Walton, Henry Bond, Herbert Turner, J. N. Keynes, Mrs. Stancombe, seedling, pale lilac; Flora Wyatt, Louisa Neate, John Wyatt, Mrs. J. Downie, Cremorne, Mrs. Boston, W. Lucas, and King of Primroses, altogether a fine lot of show flowers. 2d, Mr. S. Dobree, The Priory, Wellington, with some good flowers mingled with others a little below the mark as exhibition flowers. The leading blooms were Monarch, Herbert Turner, Acme of Perfection, H. Walton, red Dr. Moffatt, Peri, Vice-President, Thomas Goodwin, James Service, Flora Wyatt, Mrs. Stancomb, Black Knight, Drake Lewis, fine in colour but rather coarse; John Standish, J. N. Keynes, J. Downie, Christopher Ridley, very fine; W. Eckford, Lord Derby, Countess of Pembroke, Criterion, Dauntless, Royal and Purple. 3d, Messrs. Rawlings Bros., Old Church, Romford. Here the blooms were generally below size, but fresh and clean; the best blooms George Critchett, Willie Eckford, John Saunders, Leah, Vice-President, Thos. Goodwin, John Standish, James Willing, Lord Derby, James Cocker, Annie Neville, Arbitrator, O. E. Coope, Acme of Perfection, and Monarch. One flower, Baron Taunton, caused the judges a little anxiety, as a pin was put through the eye to lengthen the stem. As it was not done with the intention of giving a fictitious value to the flower, the judges felt they could not disqualify.

Seven stands of twelve fancy Dahlias competed in the class allotted to them; the best came from Mr. J. Keynes, who had fine blooms of Singularity, Enchantress, Hercules, Mons. Chauvière, Flora Wyatt, Charles Wyatt, Fanny Sturt, Henry Glasscock, Letty Coles, John Saunders, Mrs. Saunders, and Maid of Athens. 2d, Mr. S. Dobree, with Egyptian Prince, a fine and distinct fancy; Laura Haslam, Parrot, Eccentric, Attraction, J. Saunders, Hercules, Miss Bond, Viceroy, J. Carter, and Leopardess.

New Dahlias were numerous represented, and Mr. John Keynes received First-class Certificates for Bessie Ford, bright pinkish lilac; Louisa Neate, Fanny, and Maid of Athens. Mr. Charles Turner, Royal Nursery, Slough, for Charles Lidgard and Lady Golightly, white, tipped with delicate lilac; and Mr. G. H. Harris, for Constancy, yellow, and slightly tipped with lake. The same award was made to Messrs. Rawlings Bros., for James Willing, crimson, tipped with magenta-purple.

ASTERS, &c.—The best stand of thirty-six French Asters came from Mr. J. Morgan, gr. to Major Scott, Wray Park, Reigate, and with but very few exceptions consisted of the Victoria type, thereby demonstrating its high value for exhibition purposes; 2d, Mr. R. Petfield, Orpington, Kent, and here the best flowers were Victorias. With twelve French Asters, Messrs. Saltmarsh & Son, Chelmsford, were 1st with some splendid blooms of Truffaut's Pacony-flowered, very fine indeed; 2d, Mr. John Morgan.

In the miscellaneous class, fourteen boxes of cut Roses were exhibited by Messrs. Cranston & Co., King's Acre Nurseries, Hereford, which included boxes of Baroness Rothschild, Alfred Colomb, Senateur Vaisse, and a general collection of the best varieties. Messrs. Paul & Son, the Old Nurseries, Cheshunt, had six boxes of Roses in four blooms of each variety—an innovation to be commended, as it displays each variety to much better advantage than where only three blooms are shown. Mr. W. Cross had some excellent flowers from the seedling Brier in threes; Mr. Rumsey had cut Roses also, and Mr. C. Turner sent some Lilium auratum in pots, and also Lilium tigrinum splendens. Mr. Turner also contributed blooms of show, fancy and bouquet Dahlias. Some good cut blooms of Verbenas were shown by Mr. Dobree.

In the classes for table decorations Mr. W. Soder, gr. to O. Hanbury, Esq., Weald Hall, Brentwood, was 1st, with a table displaying flowers and fruit set forth to the best advantage. The best wedding bouquet came from Miss E. Stuart, 84, Seven Sisters Road, Holloway.

Botanical and Horticultural of Northumberland, Durham, and Newcastle: Sept. 12 and 13.—This old established Society held its autumn exhibition in the Town Hall and Corn Exchange, New-

castle, on Wednesday and Thursday last, when the good prizes offered brought together what was in all respects a highly creditable display, many well-grown and well-flowered specimens being exhibited. The morning broke clear and fine, giving every prospect of a bright day, which was enjoyed till about noon, when it became overcast and dull, and a perfect downpour of rain fell, but after a good soaking it cleared off, and the sun again shone out, bringing in large numbers of visitors.

Beginning with the plants, we find that for the six plants in pots, distinct, Mr. J. T. G. Williams gained the 1st prize of £10, conspicuous among his plants being *Anthurium Scherzerianum*, *Allamanda nobilis*, and *Ixora Dixiana*, all good, well-bloomed specimens. Mr. T. Wilson, gr., Normanby Hall, made a good 2d, having a fine plant of *Allamanda nobilis*, &c. For three plants in bloom, distinct, Mr. W. Moulton, gr. to the Earl Ravensworth, took the higher award, his plants being *Erica retorta major*, *Cassia corymbosa*, and *Ixora javanica*; Mr. J. Thompson, nurseryman, Ravenside, taking the 2d and 3d. For six ornamental-foilage plants Mr. J. T. G. Williams again came 1st, with *Dracena australis*, *Lantana borbonica*, &c. For three ornamental foliage plants, Mr. A. Methven, gr. to Mr. T. Lange, Gateshead, took 1st and 2d. For six Ferns, Mr. E. Tudgey was 1st, having good plants of *Gymnogramma peruviana*, &c.; Mr. J. Brogdon, gr. at Jesmond Park, taking 2d. For three Ferns, distinct, Mr. A. Methven was again 1st, with three noble plants; Mr. T. Wilson, gr., Normanby Hall, and Mr. Jas. Thompson, Ravenside, being 2d and 3d. In the class for three *Ericas*, Mr. W. Moulton, gr. to Earl Ravensworth, was placed 1st, with neat plants of *E. tricolor Holfordii*, *E. Jacksoni*, and *E. Austriana*; the 2d was also awarded to Mr. Moulton. For six *Coleus*, Mr. W. Moulton was again the premier prize-taker, conspicuous among his lot being *Madame Lemoine*, *Golden Gem*, and *Crown of Jewels*; Mr. G. Stockley was 2d, and Mr. R. Mather 3d—all showing neat bushy plants. For four *Fuchsias*, Mr. E. Sanders took the higher award. For want of tickets we could not determine who were the 2d and 3d prizetakers. Among the exhibitors for three pots of *Liliums*, Mr. W. Moulton was placed 1st, with nicely done plants of *L. auratum*, &c. For six table plants, pots not to exceed 6 inches, the specimens were not quite up to the mark. Turning to the cut flowers, we find Mr. W. Boston, Manor Farm Nurseries, was 1st, taking the county prize with twenty-four *Dahlias*, distinct, having fine blooms of *Cremona*; Mr. Dix, Royal Queen, &c.; Mr. Charles Rylance, florist, Ormskirk, being 2d, having amongst others a good bloom of *Criterion*. Mr. H. Clark and Mr. J. Jackson took equal 3d. For twelve *Dahlias* Mr. Fletcher, nurseryman, Charlestown, was 1st, having good John Bennet, James Cocker, and others; Mr. C. H. Feukes taking both 2d and 3d. For twelve *Dahlias*, distinct, fancy, Mr. W. Shaw, Birmingham, was 1st; Mr. C. Rylance, Ormskirk, 2d. In the class for twelve *Asters*, feathered, Mr. W. Spoor, jun., Swallowwell, was 1st, with a very good stand; Mr. J. Wardle, Netherwitton, 2d. In *Globe Asters* Mr. Spoor was again 1st, Mr. Wardle taking both 2d and 3d. Next come the twelve *Zonal Pelargoniums*, for which Mr. T. Flowdy, florist, Gateshead, was 1st, with good bright specimens; Mr. A. Brown, gr. to L. Barnes, Esq., Whitburn, 2d; Mr. Flowdy was again 1st for twelve *Picotees*, with very good examples; Mr. R. Scott, florist, 2d; Mr. Flowdy was also 1st for twelve *Carnations*, being well seconded by Mr. R. Scott, Newcastle. Coming to the French *Marigolds*, we find Mr. T. Atkinson, of Winlaton, 1st; Mr. C. Laws being next in order of merit. The *Pansies*, though not so good as we anticipated, gained a deal of attention. Mr. J. Wardle gained the 1st, Mr. T. Oliphant, Low Fell, being 2d. The spikes of *Gladioli* were very fine, Mr. W. Spoor, jun., taking 1st for six, having fine spikes of *Horace Vernet*, *Colbert*, *Thalia*, &c., the 2d falling to Mr. Gardener, Swallowwell. For twelve spikes, Mr. T. Fenwick was 1st, with a magnificent stand; Mr. A. Brown, gr. to T. Barnes, Esq., and Mr. J. Jackson, Kidderminster, making good 2d and 3d. The competition for twenty-four *Hollyhocks*, twelve varieties, brought out a good show, Mr. J. Stairman, gr., Public Park, Darlington, taking the higher award, with good blooms of *nobilis*, *Venus*, *Sanspareil*, *Queen of Yellows*, &c. The amateurs' plants, cut flowers, &c., though very good of their kinds, only need a passing notice, being quite eclipsed by their more favoured neighbours.

The FRUIT SHOW was, for the season, tolerably good. For one Pine, Mr. J. Brown, gr., Whinney House, Gateshead, took 1st and 3d, Mr. T. R. Jowsey being 2d. In the class for two bunches of black Grapes Mr. J. Witherspoon was 1st, with Black Alicante; Mr. R. Westcott, Raby Castle, 2d, with Black Hamburg. For two bunches of white Grapes, Mr. R. Westcott, gr. to the Duke of Cleveland, Raby Castle, was 1st, with good examples of Golden Queen; E. H. Bradley, gr., High Barnes, Sunderland, 2d. For the heaviest bunch of Grapes, Mr. J. R. Jowsey, gr.,

Seabury Park, York, came 1st, with Barbarossa, 7½ lb. (Mr. Jowsey's original idea of suspending the bunch from a small spring balance is well worthy of attention by future exhibitors in like classes); Mr. R. Turnbull, gr., Jermond Grove, 2d, with Trebbiano, 3½ lb.

For eight dishes of fruit Mr. R. Westcott, Raby Castle, was 1st, with Pitmaston Orange Nectarines, Black Hamburg, and Golden Champion Grapes, Waltham Cross Melon, Barrington Peach, transparent Green Gage, &c.; Mr. T. R. Jowsey, gr., Seabury House, Richmond, York, being 2d.

For six dishes of hardy fruit Mr. W. Shaw, gr., Blakbrook, Kidderminster, was 1st, with Morello Cherries, Damsons, Cob nuts, King of the Apples, &c.; Mr. R. Westcott, Raby Castle, being 2d.

For six Peaches Mr. T. Shield, gr. to Colonel Reed, Kenton, was 1st and 3d; Mr. J. Simon, gr., Scots House, West Boldon, being 2d, both showing very good fruits.

The show of small fruit, single dishes of hardy fruit, &c., was tolerably good, though not calling for any special comment.

A brace of Cucumbers gained Mr. Armstrong the 1st place; Mr. Lawson, Whickham Lodge, Gateshead, being 2d.

For trays or baskets of vegetables, which were of very great merit, Mr. Jas. Gardener, Swallowwell, was 1st, Mr. T. Battersby and Mr. W. Pringle taking 2d and 3d.

In the class for table decorations, Mr. W. Moulton took the President's prize, £7, being, we must say, tastefully arranged, the centre-piece being especially worthy of remark, though we fear there would be but little room for the guests; Mr. A. Methven, gr. to T. Lange, Esq., Heathfield, Gateshead, was 2d—the note on the preceding will apply with considerable force here also.

The baskets of cut flowers were tastefully arranged, Mr. C. Rylance, florist, Ormskirk, being placed 1st; Mr. F. Edmondson, gr., Whickham Park, 2d, with a rather tightly packed basket.

For vase or epergne of cut flowers for drawing-room, Mr. T. Ramshaw, Dryburn, Durham, was awarded 1st for a remarkably tasteful arrangement; Mr. E. H. Bradley, gr. to Mr. T. G. Turnbull, High Barnes, Sunderland, making a good 2d.

In a class for a bouquet for the band, Miss Bolam, Gateshead, was 1st and 2d; they were neat, and tastefully arranged, though quite large enough we think. For eighteen groups of cut flowers, Mr. J. T. G. Williams, was 1st; Mr. C. Wass, Jesmond Cottage, taking the 2d. The stands of twelve groups of cut flowers were rough and rather heavy, and not in our opinion worthy of further mention.

Miscellaneous groups not for competition were contributed by Mr. J. Harrison, North of England Rose Nurseries, Catterick Bridge, who sent five large stands of fine Roses. Mr. J. Thompson, Ravenside Nursery, Newcastle, showed some good stands of *Gladioli*. Messrs. Stewart & Meie, Kelso, sent a very neat floral design constructed almost entirely of *Everlastings* which was beautifully finished. Mr. John Bowman, Newcastle, showed a neat and cheap amateur's greenhouse, as well as various other specimens of woodwork of general excellence. Mrs. Leaderthong, Gateshead, showed a glass stand of beautifully modelled wax flowers. Mrs. Usher, Harton, South Shields, showed some curiosities in butter-working, consisting of butterflowers, vegetables, &c. Messrs. James Robson & Son, Bank Foot, Hexham, sent a nice collection of small *Coniferous* plants; and Messrs. Rivers, Sawbridgeworth, Herts, a large collection of Apples, Pears, Peaches, &c.

Bury Horticultural: The autumnal meeting of this Society was held on Friday last in the Corn Exchange. The display, taking it as a whole, was quite up to the average in point of merit, and some of the classes were remarkable for their excellence. The flowering *Begonias* attracted much attention, the plants from Hardwicke (*B. intermedia*, *B. boliviensis*, *B. Vesuvius*, and *B. Stella*), exciting great admiration. Mr. Fish also sent a remarkably fine *B. intermedia* as a specimen plant, and it formed a striking object on the centre table. A fine collection of *Coleus* charmed the eye with the brilliant and harmonious tints of their foliage, and the *Fuchsias* from Hardwicke were still very beautiful, although the season is far advanced. In the *Orchids* Mr. Powell, of Bury, was 1st with *Dendrobium chrysanthum*; Mr. Fish was 2d with *Saccolabium guttatum*, and also exhibited a specimen of *Peristeria elata*. Mr. Squibb, gr. to the Marquis of Bristol, was 1st in the new or rare plants, and Mr. Stanley 2d, with a specimen of *Bertolonia Houtteana*. Some well-grown *Selaginellas* from Hardwicke were good examples of skill in training and of general good cultivation. To turn to the cut flowers: the *Dahlias* were in strong force, the *Gladioli* were unusually varied and abundant, and the *Phlox Drummondii* (which is to a great extent superseding *Verbena* as a bedding plant) was well represented, the Ickworth display being undoubtedly the best. There

was a fine show of *Asters*, the *Roses* were good for the time of year, and the trusses of *Pelargoniums* were superb. Two blooms of *Dr. Denny Pelargonium*, raised by Mons. Jean Sisley, of Lyons, were placed upon the table by Mr. Grieve, who had received them by post that morning: the blooms were purple in colour, the lower part of the two upper petals being an intense scarlet.

There was but a short supply of fruit. The Peaches were not very good: the Nectarines were better, but not first-rate. The 1st prize black Grapes (from Ampton Hall) were very good, and remarkably well coloured; the white Grapes were not so good, and there was only one exhibit besides those shown for the dessert prizes, which were taken by Mr. Squibb and Mr. Fish. The Cherries were remarkably fine, and there was an excellent show of Apples, a crop which varies exceedingly this year, according to locality and circumstances. There were plenty of excellent *Filberts*, it being a good year for Nuts of all kinds.

The vegetable classes were well filled, both by the members and by the cottagers. There was a great show of Potatoes, of excellent quality. The cottagers' Apples and Onions were exceedingly good: the latter were perhaps better than those shown on the opposite side of the hall. The baskets of vegetables were as usual excellent, a credit to the district from which they chiefly come; and though it is not a good honey year there were some capital skeps on the cottagers' table. (From a Correspondent.)

AUTUMN PLANTING.—We are nearly at the end of the summer. If the fates are propitious and Dame Nature endeavours to make some atonement by granting us a fine warm, sunny September, then the summer will last well into the autumn, and gardeners will be generally thankful; but present evidences point rather to unsettled wet rather than to settled fine weather. The cold north-easterly winds have gone, and the chilly days which made us long for fires have passed away with them, and warm southerly winds now rule, but they bring rain and attendant dullness with them.

A Villa gardener wishes to have in his small garden as many pretty floral pictures as he can present to view all the year round; but some forethought is required to arrange this so that the succession may be as completely secured as possible. He must now begin to think what he shall do to secure something gay and winsome in early spring. We remember once seeing some charming results worked out in early spring on the sloping grassy banks at the foot of the Round Tower at Windsor Castle. The turf was lifted in autumn in a few places and some good soil was put in where the earth had been taken out, and in this *Snowdrops* were planted in clumps and various designs. By-and-by, when the awakening spring called into action plants that had remained inactive or at rest all the winter, the *Snowdrops* thrust themselves up through the grass, and unfolded their white blossoms amid the green foliage around and beneath them. This fancy of the royal gardener [was it not the late General Grey?] was a good one, and many lingered by the stone parapet, gazing over at the white blossoms that looked like snowflakes resting on the emerald turf. We made a similar attempt on our own grass plot, and the first year the *Snowdrops* and some early *Crocuses* put in with them bloomed well, but then arose the necessity for cutting the grass, and away went the foliage of the bulbs before the scythe. This ruthless but necessary cutting away of the growth eventually caused the bulbs to die away, and so the idea of floral pictures on the grass plot died away also.

But charming effects can be had by planting *Snowdrops* and *Crocuses* just within the grass, or Box, or other edging to beds or borders. Now, and on to the end of November—the sooner the better, because the bulbs are plumper—such plantings can be made; and if they are properly done they can remain for five or six years, and they will be most attractive in the early spring-time.

As the effectiveness of the bloom will depend in a great measure on the mode in which the bulbs are planted for permanent service; it is recommended that a kind of trench be dug out by the side of the edging, 8 or 9 inches in depth by 6 inches in width. Then lay in the trench a few pieces of rough fibry

turl, and in this a mixture of dung, loam and leaf-mould, with a thin layer of sand on the top, altogether about 4 inches in depth. Plant the bulbs in the sand, and fill up with a little good soil, and then fill up to the surface with the earth removed when the trench was dug. Then press all firmly down, and the work is done. In selecting these regard should be had to duration of bloom and variation of colour. Such autumn-flowered Crocuses as the Colchicum, and the pretty deep lilac *C. speciosus*, should find a place for the sake of their autumn flowers. These will bloom in September and October, and onwards. We have *Crocus speciosus* in flower now, and a very beautiful thing it is, and we can commend it highly. Then, to have some flowers as early in the year as possible we would recommend a few Snowdrops, the Cloth of Gold Crocus, which is also known as *C. reticulatus*, and the pretty early Scotch Crocus, *C. biflorus*. All three of these will find their way into bloom before any of the ordinary spring Crocuses are on the move. The Scotch Crocus is marked with lines of dark purple, and it with the white Snowdrops, and the golden and purple-streaked Crocuses, make a pretty combination. Lastly, to make up the latest display, such fine varieties as the large yellow, the striped Sir Walter Scott, and Pride of Albion—the first faintly, and the last heavily striped, the white Mont Blanc, and the purple David Rizzio. These are all fine large-flowered varieties, of moderate price.

Great objection is sometimes made to a verge of Crocuses of this character on the ground that the foliage looks unsightly while making its growth in spring; but the head of bloom—doubly welcome because there is so little else in the way of flowers to bear them company—amply compensates for any drawback of this kind, and some nimble fingers could soon plait the grass together, and make it look neat, until it dies away.

Lines of Crocuses so planted are worthy of and should have a little attention during summer. The bulbs are greatly helped if about thrice during the summer the soil be loosened a little on the surface, and a good soaking of liquid manure given. The results will be seen by-and-by, in larger flowers, in brilliancy of hue, in duration of bloom, and in an effect that will give unbounded satisfaction and delight to the planter.

The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, SEPT. 12, 1877.

MONTH AND DAY.	BAROMETER.		TEMPERATURE OF THE AIR.				HYGROMETRICAL DEDUCTIONS from Glaisher's Tables 6th Edition.	WIND.	RAINFALL.

Sept. 6.—A very fine day. Cloudy in evening. Cloudless at night.
 7.—Fine, bright, cloudy till evening, then cloudless.
 8.—A fine day, cloudy and cool. Strong wind.
 9.—A fine day, partially cloudy. Windy.
 10.—Dull and cloudy till evening, then clear. Slight rain fell at 7 A.M.
 11.—A fine day, but generally cloudy. Overcast from 2 to 4 P.M., with showers of rain.
 12.—Generally fine, but dull and cloudy at times. Showers of rain at about 4 P.M. and 8 P.M.

LONDON: *Barometer*.—During the week ending Saturday, September 8, in the neighbourhood of London the reading of the barometer at the level of the sea decreased from 30.07 inches at the beginning of the week to 29.67 inches by the morning of the 3d, increased to 30.36 inches by the evening of the 4th, decreased to 29.84 inches by the afternoon of

the 7th, and increased to 29.99 inches by the end of the week. The mean reading for the week at sea level was 30.02 inches, being 0.12 inch above that of the preceding week, and 0.09 inch below the average.

Temperature.—The highest temperatures of the air observed by day varied from 69° on the 6th to 58° on the 3d; the mean value for the week was 64.1°. The lowest temperatures of the air ranged from 42° on the 5th to 45° on the 3d, the mean for the week was 45.1°. The mean daily temperature of the air for the week was 19.1°, the least range in the day being 10°, on the 3d, and the greatest 26°, on the 6th.

The mean daily temperatures of the air were as follows:—2d, 55°.8; 3d, 52°.1; 4th, 52°.5; 5th, 53°.3; 6th, 54°.7; 7th, 54°.2; 8th, 52°.4, and the departures in defect of their respective averages were -3°.5, 7°, 6°.3, 5°.3, 3°.7, 4°.2, 5°.9. The mean temperature of the air for the week was 53°.6, being 5°.1 below the average of sixty years' observation.

The highest readings of a thermometer with blackened bulb in vacuo, placed in sun's rays, were 128.5° on the 6th, 127.5° on the 2d, 122° on the 5th, and 120.3° on the 4th; on the 3d the reading did not rise above 80°. The lowest readings of a thermometer on grass, with its bulb exposed to the sky, were 34.3° on the 5th, 36° on the 6th, and 38.5° on the 2d and 8th. The mean of the seven low readings was 39°.

Wind.—The direction of the wind was variable, and its strength moderate. The weather during the week was fine but cool. Heavy rain fell on the 3d.

Rain fell on two days during the week; the amount collected was 0.85 inch, 0.83 inch of which fell on the 3d inst.

ENGLAND: *Temperature*.—The highest temperatures of the air observed by day were 69° both at Blackheath and Cambridge, and 68° at Truro and Sunderland; the highest temperature at Liverpool was 59.5°, and at Wolverhampton, 60.3°; the mean value from all stations was 64.3°. The lowest temperatures of the air observed by night were 34.3° at Bristol and Eccles, 35° at Truro, and 36.1° at Cambridge; and the lowest temperature at Sunderland was 46°, and at Portsmouth 43.3°; the general mean from all stations was 40°. The range of temperature in the week was the greatest at Truro, 33°, and the least at Liverpool, 17°; the mean range of temperature from all stations was 24.3°.

The mean of the seven high day temperatures was the highest at Cambridge, 65°, and Blackheath, 64.3°, and the lowest at Liverpool, 57.1°, and Wolverhampton and Bradford, both 58°; the mean from all stations was 61°. The mean of the seven low night temperatures was the lowest at Bristol, 39.5°, and Eccles, 40.3°; and the highest at Portsmouth, 48.5°, and Sunderland, 48°; the mean value from all stations was 44.3°. The mean daily range of temperature in the week was the greatest at Bristol, 23.4°, and the least at Liverpool, 10.4°; the mean daily range from all stations was 16.1°.

The mean temperature of the air for the week from all stations was 51.4°, being 5° lower than the value for the corresponding week in 1876. The highest was 54.3°, at Sunderland, and the lowest 48°, at Eccles.

Rain fell on two or three days at most stations, but at Hull and Bradford it fell on five days. The amounts varied from 2 inches at Hull, 1.5 inch at Norwich, and 1.3 inch at Bradford, to half an inch at Sunderland; the average fall over the country was 1.3 inch.

The weather during the week was generally fine and cool. Frosts on the grass were recorded at Bristol on the 4th, 5th, 6th, and 7th. Thunderstorms occurred at Portsmouth and Norwich on the 3d.

SCOTLAND: *Temperature*.—The highest temperatures of the air observed by day varied from 65° at Dundee to 59° at Aberdeen; the mean value from all stations was 60.3°. The lowest temperatures of the air observed by night ranged from 33° at Perth to 41° at Leith; the mean value from all stations was 37.5°. The mean range of temperature in the week was 23.4°.

The mean temperature of the air for the week from all stations was 50°, being 3° lower than the value for the corresponding week in 1876. The highest was 51°, at Dundee; and the lowest 43.3°, at both Paisley and Perth.

Rain fell at Dundee to the amount of 1 inch; at Glasgow, Edinburgh, and Leith four-tenths of an inch fell; at Paisley no rain fell. The average fall over the country was half an inch.

DUBLIN.—The highest temperature of the air was 67.4°, the lowest was 36.3°, the range was 30.1°, the mean was 53.3°, and the fall of rain 0.08 inch.

JAMES GLAISHER.

Enquiries.

He that questioneth much shall learn much.—BACON.

204. *J. A. E. A.* asks: "Can any one tell me of a small bright plant that would keep evergreen all the winter? It is to plant on a memorial stone in a village churchyard, and must be low and compact."

ANNUALS FOR SPRING-FLOWERING: *J. M.* Sow *Silene* and other annuals for spring-flowering at once, in the best situation you can give them, well exposed to light, but sheltered from winds.

CRITICISM: *J. M.* should be a little more modest in his criticism of others.

CUCUMBERS: *W. D.* We cannot answer your enquiry very definitely without knowing your object in making it. If you wish to know whether you could properly show Cucumbers in a collection of vegetables, we say Yes; if in a collection of fruit, we say No. Yet the Cucumber is undoubtedly a fruit. There is a common-sense meaning to be attached to these terms, vegetables and fruit, when used as supplied to exhibitions, and in the absence of definitions you should be guided by these.

EVERGREENS: *C. Newcastle.* If Conifers will suit your purpose, take *Cupressus Lawsoniana erecta viridis*, the finest of all evergreens; and *Libocedrus decurrens*, or *Thuja borealis*. The *Libocedrus* you will probably find under the name of *Thuja gigantea*. If you do not wish for Conifers, a good variety of *Rhododendron* (catawbiense breed) and the *Acuba japonica* may be recommended; or a pair of *Hollies*, either green or variegated, such as *Hodginsii* and *Golden Queen*. Any of these would make a specimen suitable to adorn a grass plot.

FRUITS TO NAME: *C. Ford.* If you send us six good samples we will name them for you. We cannot undertake to name florists' flowers. If you are a Fellow of the Royal Horticultural Society, you can do as you propose.

GLADIOLUS: *Subscriber.* These flower fairly well in 6-inch pots. They should be potted in spring, and started in a greenhouse pit, removing them outside and plunging the pots as spring advances into summer.

HARES AND RABBITS, TO PROTECT THE BARK OF TREES FROM: *H. & Co.* We refer you to p. 342 of our last volume (vol. vii., new series), where you will see that a Belgian gardener recommends his *confrères* to use a wash of dog's-dung, which he says he has himself successfully employed. Try this easy remedy, and report the result.

INSECTS: *J. James.* Chrysalis of the puss moth, *Dicranura vinula*. *A. M.*

INSECT IN POTATOS: *Arcanum.* The small white insect was not to be found among the Potatos when received.

NAMES OF PLANTS: *A. Tuck.* *Dianthus chinensis*.—*H. King.* In the absence of flowers we cannot be quite sure, but it looks like *Vaccinium madrense*.—*L. K.* *Nerine curvifolia*.—*D. D.* *Rhus Cotinus*, the Wig-plant. —*A. L. J.* *Calla palustris*, a near ally of the Trumpet Lily so called, and of the *Arum* of our hedgerows. —*W. B. 1.* *Glauca maritima*; 2. *Glaucium luteum*, Horned Poppy; 3. *Sinapis tenuifolia*; 4. *Pyrethrum fruticosum*; 5 and 6, next week; 7. *Sempervivum arachnoideum*.—*P. H. Gosse.* If your *Epidendrum* bears a panicle, why do you send a single flower? Since it is unknown, a single flower is good for nothing. *A. is E.* *stenopetalum*, *Hook.*, a plant that is a candidate for death in Europe. *H. G. Rehb. f.*—*G. Palmer.* Your plant is probably *O. microchilum*—too much crushed to say with certainty.—*Irish Sub.* *Spiraea arifolia*.—*J. Mosse.* Apparently *Tritonia miniata* or *T. crocata*.—*C. W. D.* *Erica vagans*.—*Constant Reader.* 1. German Ivy, *Senecio mikanoides*; 2. *Cephalotaxus drupacea*; 3. *Bryonia dioica*.—*Omega.* 1. *Centrosema multiflorum*; 2. *Anomatoca cruenta*.—*J. Mcl.* *Herniaria glabra*.

PETUNIAS: *Subscriber.* We are not aware that the striped varieties "bear little or no seed." In fact, seeds of Messrs. Hender's striped *Petunias*, some of the finest in existence, is advertised freely at a reasonable price, so that it must be plentifully produced.

POPLAR LEAVES: *G. C.*—The Poplar leaves are attacked by a fungus—*Melampsora populina*, *Léveillé*. It has nothing to do with the Potato disease. Since *Du Bary* produced the disease directly from the spores of the Potato fungus, it is useless to attribute it to atmospheric influences, though that may favour the development of the fungus. *M. J. B.*

SCHIZOSTYLIS COCCINEA: *Subscriber.* This is best planted out in moderate sized tufts in a bed of light, rich soil, and taken up towards autumn and potted for flowering indoors. A tuft of six or eight stems might be got into a 5-inch pot.

VINES: *W. D.* They might doubtless be lifted now, if the operation is carefully performed, but the "fruiting next year" depends on their present condition.

•• Correspondents are specially requested to address, post-paid, all communications intended for publica-

tion to the "Editors," and not to any member of the staff personally. The Editors would also be obliged by such communications being sent as early in the week as possible. Correspondents sending newspapers should be careful to mark the paragraphs they wish us to see. Letters relating to Advertisements, or to the supply of the Paper, should be addressed to the Publisher, and not to the Editors.

FOREIGN SUBSCRIBERS sending Post-office Orders are requested to make them payable at the post-office, King Street, Covent Garden, London, and at the same time to inform the Publisher at the office of this Journal.

ERRATUM.—In the report of the Carlisle show, for "Bramhan" read "Bramham." Mr. Bramham gained the 1st prize for wirework, and a certificate of merit for the Allerton Priory Boiler.

DIED, on September 8, JOHN FRASER, aged 55, for twenty-two years gardener at Norley Hall, near Frodsham, Cheshire.

Markets.

COVENT GARDEN, September 13.

Our market does not show any improvement, the greatest activity being amongst foreign produce, of which a large quantity, principally Pears and Plums, is now reaching us, and making exceptionally high prices. Peaches and Pines are in demand, and will make good returns; Grapes are bad, and likely to be worse. Kent Cobs have met with a ready sale at advanced rates. Trade quiet. James Webber, Wholesale Apple Market.

SEEDS.

LONDON: Sept. 12.—A quiet but firm feeling characterises the trade for agricultural seeds. Of red Clover seed there appears to be a fair crop in France, and quotations have consequently opened at a moderate level. If the French houses would reduce their demands some 2s. to 3s. per cwt. a good business would probably ensue. Some New York advices just received speak favourably of the prospects in America for red seed. In Alsike, both here and on the Continent, there has been some speculative business doing. White Clovers keep steady. Notwithstanding the recent upward movement, current rates are still by no means out of the way. Trefoils are rather dearer. The late rains are reported to have inflicted considerable damage on Scotch Rye-grasses; but the Irish crop is said to be satisfactory both for quantity and quality. Of foreign Italian an abundant supply may be expected from France. Winter Tares come forward more freely, and meet a good demand at slightly increased rates. Smallness in size appears to be the special characteristic of this season's growth. Good samples for the year are now obtainable on Mark Lane at a moderate figure. For sowing Rye there is a brisk request, on former terms. A noteworthy feature of the present week has been the purchase by the manufacturers of between 1000 and 2000 quarters of new English white Mustard seed. If the yield had proved an average one the rates realised would have been highly remunerative to the growers. Rape seed keeps very firm; plump black parcels are now with difficulty met with. Blue Peas are steady alike in value and demand. For bird seeds the trade is without feature. John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.

CORN.

At Mark Lane on Monday trade was firm, with an upward tendency. English Wheat was quoted from 60s. to 65s. per quarter, the higher price applying to white produce weighing quite 65 lb. to the bushel, while foreign Wheat, of which there was a full supply, realised the extreme prices of last Monday. Barley was slow of sale, but fine malting produce was scarce, and fully as dear. Malt remained steady. Oats and Maize were purchased to a moderate extent, but the liberal importation of the former rather check the upward tendency. Beans and Peas were quiet on former terms, while as regards flour no change can be reported.—Trade on Wednesday was firm, without much doing, the demand being principally confined to the better descriptions of produce, of which there was a limited supply. The best samples of new English Wheat were worth from 64s. to 65s. per quarter, while fine malting Barley of this year's crop realised close upon 50s. per quarter.—Average prices of corn for the week ending Sept. 8:—Wheat, 60s. 6d.; Barley, 39s.; Oats, 28s. 5d. For the corresponding week last year:—Wheat, 46s. 8d.; Barley, 36s.; Oats, 26s. 11d.

CATTLE.

At Copenhagen Fields on Monday in beasts was exceedingly dull, except for the choicest descriptions, which found purchasers at about late rates. Trade is very dull for sheep, at lower rates. A clearance was not effected. We cease quoting lambs, the season being over; the few that come make about the same as small sheep. Choice calves were rather dearer.—Quotations:—Beasts, 4s. 4d. to 5s., and 5s. 6d. to 6s.; calves, 5s. to 6s. 4d.; sheep, 5s. 4d. to 6s., and 6s. 6d. to 7s.; pigs, 4s. to 5s. 4d.—On Thursday the tone of the market was rather quiet. Supplies were about the average. Both beasts and sheep sold steadily at barely Monday's prices. Calves steady, but not active, and pigs sold at about late rates.

HAY.

At the Whitechapel market on Tuesday, with a small supply and a brisk trade, prices were rather better than on Saturday last. Prime old Clover, 100s. to 147s.; inferior, 85s. to 95s.; good new, 100s. to 135s.; prime old meadow hay, 90s. to 124s.; inferior, 70s. to 85s.; good new, 80s. to 115s.; straw, 44s. to 57s. per load.—On Thursday only a short supply of fodder was on sale. There was a brisk trade, and prices ruled very firm. Quotations:—Prime old Clover, 100s. to 147s.; inferior, 85s. to 95s.; good new, 100s. to 135s.; prime old meadow hay, 90s. to 124s.; inferior, 70s. to 85s.; good new, 80s. to 100s.; and straw, 44s. to 57s. per load.—Cumberland Market quotations:—Superior meadow bay, 116s. to 126s.; inferior, 88s. to 105s.; superior Clover, 132s. to 140s.; inferior, 100s. to 110s.; and straw, 55s. to 60s. per load.

POTATOS.

The Borough and Spitalfields reports state that trade continues steady, at about previous rates. The supply is good, but it includes some samples very much blighted. Kent Regents, 90s. to 110s. per ton; Essex ditto, 70s. to 95s.; kidneys, 120s.; Victorias, 80s. to 90s.—The imports into London last week were very trifling, being confined to the receipt of 375 sacks from Rouen, and 10 bags from Amsterdam.

COALS.

On Monday there was no change in the value of best coals, but "seconds" advanced 6d. per ton. The prices current on Wednesday were:—Walls End—Hetton, 20s.; Hetton Lyons, 18s. 3d.; Hawthorns, 18s. 3d.; Original Hartlepool, 20s.; South Hetton, 20s.; East Hartlepool, 19s. 9d.; South Kelloe, 19s.; Beland West Hartley, 17s. 3d.; West Hartley, 17s. 3d.

BOULTON & PAUL, HORTICULTURAL BUILDERS, NORWICH.

No. 75.—MELON FRAMES and FORCING FRAMES.

The largest Stock in the Kingdom, ready to be despatched on receipt of orders.

These Frames are made of the best red deal, thoroughly seasoned, and fitted by first-class workmen; 24 in. high at the back, 13 in. high in front; painted three coats of good oil colour, glazed with best 21-oz. glass, every pane of which is nailed in and bedded in with putty—the best method of glazing known, and adopted by the most eminent Builders and leading Nurserymen (see The Garden for January 13, 1877, p. 30). Iron handles to each light, and an iron strengthening bar across. Each light is 6 ft. by 4 ft., and 2 in. thick.

CASH PRICES (Carriage paid).

	Length.	Width.	£ s. d.

Packing to be charged, and half allowed if returned carriage paid.

BOULTON & PAUL, HORTICULTURAL BUILDERS, NORWICH.

THE IMPROVEMENT OF LANDED ESTATES,

By DRAINAGE, ENCLOSING, CLEARING, the ERECTION of FARM BUILDINGS and COTTAGES, WATER SUPPLY, &c.

THE LAND LOAN AND ENFRANCHISEMENT COMPANY,

(INCORPORATED BY SPECIAL ACT OF PARLIAMENT)

ADVANCES MONEY—

- 1st.—To the OWNERS of SETTLED and OTHER ESTATES, for the ERECTION of FARM BUILDINGS and COTTAGES, and for the DRAINAGE, IRRIGATION, ENCLOSING, CLEARING, and GENERAL IMPROVEMENT of LANDED PROPERTY, in any part of the United Kingdom.
- 21.—To the Owners of SETTLED ESTATES in ENGLAND, for the erection or completion of MANSIONS, STABLES, and OUTBUILDINGS, and for the construction or erection of RESERVOIRS, and other Works of a Permanent Nature, to supply Water for the use of the Estate, or for any other purpose.
- 3d.—To Landowners generally, to enable them to subscribe for Shares in Companies, for the CONSTRUCTION of RAILWAYS and NAVIGABLE CANALS, which will beneficially affect their Estates.
- 4th.—To INCUMBENTS, for the Improvement of their GLEBE LANDS, by DRAINAGE, and the erection of FARM BUILDINGS and COTTAGES.
- 5th.—To COPYHOLDERS, for the ENFRANCHISEMENT of COPYHOLD LANDS.

The amount borrowed, with the expenses, would be charged on the Estate benefited, and repaid by a Rentcharge terminating in TWENTY-FIVE YEARS.

NO INVESTIGATION OF THE LANDOWNER'S TITLE IS NECESSARY.

Forms of Application, and all further particulars, may be obtained of Messrs. RAWLENCE & SQUAREY, 22, Great George Street, Westminster, S.W., and Salisbury; or Messrs. ASHURST, MORRIS, CRISP & Co., 6, Old Jewry, London, E.C.; or Messrs. GILLESPIE & PATERSON, W.S., 81A, George Street, Edinburgh, Agents for the Company in Scotland; and at the Offices of the Company as below.

WRIGHT'S ENDLESS-FLAME-IMPACT HOT-WATER BOILERS.

GUARANTEED

The most Powerful, the most Rapid, the most Economical, the Simplest, and the Cheapest in the World.

"The 'Boiler of the Future,' I have no doubt about this."—WM. THOMSON, Tweed Vineyards.

From the "Gardener," July, 1877.

WRIGHT'S PATENT ENDLESS FLAME-IMPACT BOILERS.

"The first intimation I had of the existence of these boilers, or of their inventor, was a pamphlet I received through the post. Its perusal satisfied me that Mr. Wright had a sounder theoretical knowledge of the subject of heating water than any author I had ever perused. I also liked the construction of his boiler better than any I had previously met with. Mr. Lewin, gardener, Drumpellier, was represented as having fixed one of these boilers, and as bearing testimony to its excellence; and as I knew Mr. Lewin to be not only a good gardener, but a shrewd, clever man, I felt satisfied that the boiler must be of the excellence which my own knowledge of such matters led me to conclude it was from its construction.

"Having occasion to be in the neighbourhood of Glasgow last February, I went to Airdrie and called on Mr. Wright, who took me to the foundry in Glasgow where the boilers are manufactured. There he put one together in a few minutes, and a closer examination of it only strengthened my preference for it over all boilers I had previously seen. I ordered a 4-C boiler, which I have fixed to heat 2600 feet of 4-inch pipe in two early vineries. One, a Muscat-house, 200 feet long and 16 feet wide, is built and planted, the other will not be built till autumn; so that at present the boiler is only heating 1300 feet of pipe, which it does with a very small fire and the damper nearly close in, burning little more than half the coal used in any other boiler I have—and I have some of the most approved, both of my own and other people's designs.

"The result of the trial I have had of Wright's boiler is, that I have ordered four more, and will pull out all my other boilers as opportunity occurs, and replace them by his, with a view both of saving and efficiency.

"No doubt many will ask wherein consists the cause of the efficiency of this boiler over others? To explain this, it may be well to observe that when fresh coal is added to the fire of any other boiler known to the writer, the first process that goes on is the distillation of the gas from the new coal, and its rapid discharge, in advance of the flame, up the chimney and unconsumed. This is not only a great evil in itself, but to effect it the heat is extracted from the fire that was in the furnace when the fresh coal was added, and little or no benefit is got from the fire till the gas is up the chimney and the destruction of the carbon in the coal has begun.

"Many expedients have been adopted to prevent this loss; and no doubt careful stoking can do much in the case of large boilers for generating steam, where there is a long fire, and where the fresh coal is always added to the front of the fire, compelling the gas to pass over the red fire and get ignited; but in the case of boilers used for heating hothouses, this is not practicable, and especially with ever-changing stokers, who, as a rule, think if they throw a given quantity of coal on the fire no further care is needed. Now, in the case of Wright's boilers, distillation of gas takes place as in others, but it has no possible chance of escape unconsumed—for gas and flame are compelled to meet face to face, over and over again, ere they leave the boiler; consequently all the gas is consumed, and the heat from it made to impinge directly on the flat surfaces of the various sections of the boiler on its way upwards. Here lies the great secret of this boiler's power.

"What also adds not a little to increase the power of the boiler is the method adopted for supplying a hot-blast, by passing air from the front of the cast-iron stand on which the boiler is placed through an intricate passage, till it is discharged at the back of the ash-pit under the bars. This leads to the most perfect combustion of the commonest cross-coal. There is also an arrangement by which a hot-blast is thrown into the furnace through the furnace door. Then there is a moderate supply of air entering the furnace all round, where the first section is laid on the heater-jacket of the boiler; this has the same effect on the fire as the well-known Argand burner has on the lamp, giving a clear fierce flame. These boilers are made up of a series of simple castings, jointed by means of indiarubber rings, which allow them to expand and contract; therefore they are sure to be the safest of boilers.

—WM. THOMSON.

"Tweed Vineyard, June 14, 1877."

"I think yours the most perfect 'Heat Trap' yet invented. —DAVID THOMSON, Drumlaugh Gardens."

For details and particulars as to the various sizes made, and prices, please see our pamphlet, entitled, "OUR BOILERS AND HEATING," which will be handed to all applicants, post-free.

We are prepared to supply Thirty Different Boilers of all powers, sizes, and heights, and can vary these to suit any particular situation or requirement.

MR. MECCHI'S ADDRESS to his OLD FRIENDS and CUSTOMERS and to the PUBLIC:—

"As it has been erroneously supposed by some that I am no longer interested in my London business, I think it desirable to state that I continue to carry it on as energetically, and I trust as satisfactorily to the Public, as formerly, assisted by my only son, who will in due time succeed me. It is now fifty years ago since I first commenced business in Leadenhall Street, and what changes have taken place! Then everybody shaved, and my razor and razor-strop trade was immense; now moustache and beard are the order of the day, and the razor and strop trade is comparatively defunct. Then there were no railways, so people stayed at home and used wooden dressing-cases; now everybody travels by rail, and we have dressing-bags to suit the altered conditions. Fifty years ago the poor geese supplied our pens, and many a now rich merchant in the City will remember the quality of Mecchi's shilling pen-knives; but steel pens have extinguished the pen-knife trade and the penmaking machines, and the geese are in peace, except at Michaelmas. In fact, steam has altered, and I may safely say, improved everything, and has made us a nation of travellers both by land and sea. I wonder how much time is now occupied in reading the steam-worked press? and how much less time is occupied in sipping port wine, as we used to do fifty years ago, when we could not travel? Steam will make our 4 lb loaves cheaper some day, just as it has converted calico from 2s. 6d. to 6d. or less per yard. Then, again, a letter which used to cost 6s. 6d. to Cork is now carried for 1d. Sir Rowland Hill richly deserves a monument. But to return to business: fifty years ago, when I first commenced on a small scale, I made it an axiom that what I sold should be good and useful, and I believe thousands who used the strop and paste, which I personally invented, can testify to this; if fact, it was sometimes complained of that I stamped on my razors 'Exchanged if not approved.' I have never, and shall never so long as I live, deviate from that principle, because it is the true means to retain and increase one's connection. I devoted my attention especially to the quality and convenience of arrangements in the dressing bag and dressing case department, and in the tasteful selection of articles suitable for presentation, as well as on the matter of dispatch boxes and writing cases. Although both razors and penknives have 'gone out,' our sportsmen remain, and 'sporting knives' form one of our special departments. I feel firmly convinced that there is no fear of the departure of knives and forks, or dinners, so we make this an important department in quality and price. In conclusion, I ask no favours, but simply desire that my customers should compare the quality and price of my wares with those of other dependable establishments, and form their own conclusions. Most of my worthy assistants and workmen have been nearly forty years in my service, and long ago learned that civility and attention to our customers are as important as good quality in the articles sold. Illustrated catalogues will be forwarded post-free on application."

112, Regent Street, W., opposite Vigo Street.—1877.

WALTER MACFARLANE & CO., GLASGOW.

WORTHINGTON SMITH'S

SALUS IN SOLUTION.

A Powerful Fertiliser,
An Unfailing Insecticide & Disease Preventive,

SUITABLE FOR

All Soils, Fruits, Vegetables, Flowers, and Grasses.

All PLANTS are at once greatly benefited by SALUS IN SOLUTION.

All PARASITES sink under SALUS IN SOLUTION.

Can be used through the Syringe, Vaporiser, or Watering Pot.

Directions for use will be sent with each parcel, or may be had gratis and post-free.

A 14 lb. box of SALUS is sufficient for 100 gals. of water.

A 7 lb. box of SALUS is sufficient for 50 gals. of water.

A Sample Packet of SALUS is sufficient for 5 gallons of water.

14 lb. for 14s. ; 7 lb. for 7s. ; Sample by post for 1s. 4d.

SALUS is sold as an excessively fine powder, and can be used in a dry state if desired.

"I feel it a public duty, as well as a personal pleasure of the highest kind, to be able to record this fact, and heartily congratulate Mr. Smith on the success of his SALUS in eradicating the Cucumber and Melon Disease.

"The whole of our plants, old and young, soon got infested with the disease,—they are now in robust health, without speck or spot, and are swelling off and ripening fine crops.

"The early Melons, badly affected at one time, are now carrying an enormous load of fine fruit—about a hundred in a small house—so we have reason to be proud of the powers of SALUS and grateful to its discoverer.

"Melons treated with SALUS took the First Prize at the fête of the Suffolk Agricultural Society.

"Our POTATOS were all dressed with SALUS—for the last six weeks their growth has been extraordinary. There is an immense crop of tubers, all sound, in these gardens." D. T. Fish.

"Potatos are in very good condition. Some little disease has shown itself in the haulm, but we have not found it communicated much to the tubers. I have planted all my crop with SALUS." William Ward, Stoke Edith, Hereford.

THE HUNDRED GUINEA CONSERVATORY

FIXED ANYWHERE

ART-WITH-ECONOMY-APPLIED-TO-CONSERVATORIES

14
PRIZE
MEDALS

In consequence of the increasing demand for Conservatories, in which pure art is combined with moderate cost, T. H. P. DENNIS & Co. have been led to introduce designs of a character hitherto unknown. One of these designs, showing a house 22 feet 6 inches x 13 feet 6 inches, is annexed, and the result, as regards the extremely low price (which includes fixing, glazing, painting, carriage, &c.), has been attained only by special machinery and a system of interchangeable parts.

T. H. P. DENNIS & Co. are also prepared to provide and fix Hot-water Heating Apparatus and Horticultural Buildings of any dimension or description.

Full-sized specimens of Greenhouses, &c., and Hot-water Apparatus in work, can be inspected at Manion House Buildings, London, E.C.

Gentlemen waited upon at their residences by experienced designers.

LASCELLES' PATENT BENT WOOD CONSERVATORIES and GREENHOUSES.—All Gardeners know that Wood is better than Iron for Plant Growing, and by the above system a handsome curved house can be erected as cheaply as a plain straight one.
 The curved house is more durable, stronger, lighter in construction, and no bent glass is required.
 W. H. LASCELLES, 12r, Dunhill Row, London, E.C., will supply Drawings and Estimates free of charge.

JOSEPH BRAMHAM, HORTICULTURAL and HOT-WATER ENGINEER, WIRE WORKER, WEAVER, &c., 104, Dale Street, and 44, Elia Street, Liverpool.
 J. B. strongly recommends the **ALLERTON PRIORY BOILER** as one of the most powerful for extensive work. He has fixed one capable of heating 10,000 feet of 4-inch piping. See *Gardeners' Chronicle*, p. 647. Also his **WELDED WROUGHT IRON WATERWAY BACK** for ordinary Saddle Boilers. These Backs can be fixed to any Boiler now in use, and are a great saving in fuel and labour. He is also prepared to fix any kind of Boiler made.
 Manufacturer of the Registered **LIVER FRONT** for large Boilers, **IRON and WIRE WORK** in all branches. References from Noblemen and Gentlemen for work done. Plans and Estimates given.

Silver Medal, 1874.
THE TERMINAL SADDLE BOILER.—First-class Certificate, 1867; Highly Commended, 1873; and First-class Certificate, 1875.

"This Boiler possesses the rare merit of sucking all the heat from the fire."—*Gardeners' Magazine*, p. 254.
 "I have no doubt the Best Boiler, that will burn any kind of fuel, is the Terminal Saddle."—*Journal of Horticulture*, p. 327.
 "For moderate cost and real efficiency the Terminal Saddle is one of the very best."—*The Garden*, p. 95.
 Prospectus post free.
T. JONES, Temple Street, Manchester.

JONES'S PATENT "DOUBLE L" SADDLE BOILER.

These Boilers possess all the advantages of the old Saddle Boiler, with the following improvements—viz., the water-space at back and over top of saddle increases the heating surface to such an extent that a "PATENT DOUBLE L SADDLE BOILER" will do about twice the amount of work with the same quantity of fuel; the cost of setting is also considerably reduced, and likewise the space occupied; at the same time these Boilers are simple in construction, and being made of wrought iron are not liable to crack. They are made of the following sizes:—

Sizes.			To heat of 4-in. Pipe.	Price.
High.	Wide.	Long.	Feet.	£ s. d.
20 in.	18 "	18 "	300	7 0 0
20 "	18 "	24 "	400	8 0 0
20 "	18 "	30 "	500	9 0 0
24 "	24 "	24 "	700	12 0 0
24 "	24 "	30 "	850	14 0 0
24 "	24 "	36 "	1,000	16 0 0
24 "	24 "	48 "	1,400	20 0 0
28 "	28 "	60 "	1,800	25 0 0

Larger sizes if required.
 From Mr. CHARLES YOUNG, Nurseries, Balham Hill, S.W., May 29, 1873.

"Having given your Patent 'Double L' Boilers a fair trial at my Nurseries, I beg to say that they are most satisfactory. I consider them the best in use, and without doubt the most economical of all boilers; they will burn the refuse of other tubular boilers I have in work."

PRICE LISTS of HOT-WATER PIPES and CONNECTIONS, with Boilers, of all sizes and shapes; or **ESTIMATES for HOT-WATER APPARATUS,** erected complete, will be sent on application.
J. JONES AND SONS, Iron Merchants, 6, Bankside, South-wark, London, S.E.
 When ordering Boilers please refer to the above advertisement.

CRITCHLEY'S PATENT HEAT REGULATOR,
 AN APPARATUS FOR REGULATING THE HEAT IN HORTICULTURAL BUILDINGS.

A, Iron Box fitted up water-tight. B, Pipe or Supply of Water from Boiler. C, D, Pipes for Circulating Hot-Water. E, F, Pipes for Return of Water to Iron Box. G, Pipe for Returning Water to Boiler. H, I, J, K, Piston-Rods for Opening and Closing Valves.
 The advantages of these Regulators are that houses may be kept at different degrees of heat, or the circulation of water and heat entirely stopped in one part and not in others. They may be fitted with as many valves as required, and are particularly adapted for forcing houses where top and bottom heat is used. They may be fixed in any part of the apparatus most suitable for working, without regard to the position of the Boiler.
 The following Testimonial has been received:—
 "Berkeley Castle, April 13, 1875.
 Gentlemen,—I am happy to inform you, now that the late severe winter is past, that the Hot-Water Apparatus erected by you does its work to my entire satisfaction. As to the two Heat Regulators, which represent thirty valves, I have had ample opportunities of practically proving them, and unhesitatingly admit they are far superior to any other valve; in fact, I think it the greatest improvement that has come out for horticultural purposes.
 "I am, Gentlemen, yours truly,
 "R. H. CRONK,
 "Gardener to the Right Hon. Lord Fitzhardinge."
 Estimates and Plans furnished for Warming Gentlemen's Mansions and Public Buildings. Orders attended to in any part of the kingdom, and guaranteed to answer their intended purposes. Prospectus and Price Lists post-free.

STEVENS' TRENTHAM GREENHOUSE BOILER,

After long experience, has proved the most SIMPLE, ECONOMICAL, EFFECTUAL, and LASTING BOILER extant; recently improved.

Copy of a Testimonial.
 "Royal Exotic Nursery, King's Road, Chelsea, S.W.—Aug. 8, 1877.
 Messrs. SILVESTER.

"Gentlemen,—In reply to your enquiry as to our opinion of your Stevens' Treatham Boilers, we do not hesitate to pronounce them to be by far the best Boilers we have ever used. Our establishment is a very large one, and we have tested most of the various descriptions of Boilers which have been brought out from time to time. We originally commenced with one Treatham Boiler, and we have now *thirteen* of various sizes at work.
 "For certainty of action, economy in fuel, and freedom from breakdown, we have never had a Boiler at all equal to the Stevens' Riveted Treatham Boilers supplied by you, and we have never felt so little anxiety in connection with our hothouses during the cold winter months as we do now.
 "We are not in the habit of giving testimonials, but we think this may fairly be an exception to our rule, as the matter is one of such importance to the Gardening Public generally, and our experience has led us to form a very decided opinion.
 "We are, Gentlemen, yours faithfully,
 "JAMES VEITCH AND SONS."

For Illustrations, with full particulars, apply to the Sole Makers, **F. & J. SILVESTER, HOT-WATER ENGINEERS, &c., &c.,** Castle Hill Works, Newcastle, Staffordshire.
 Our Boilers are the ONLY ones made with the sanction and under the inspection of the inventor, Mr. Stevens—all others being base imitations.

Oil Paint No Longer Necessary.

**HILL AND SMITH'S BLACK
VARNISH** for Preserving Ironwork, Wood, or Stone.
This Varnish is an excellent substitute for oil paint on all out-
door work, while it is fully two-thirds cheaper. It was intro-
duced upwards of thirty years ago by the advertisers, and its
genuine good quality, notwithstanding a host of unprincipled
imitators, is fully attested by its constantly increasing sale. It
may be applied by an ordinary labourer, requires no mixing or
thinning, and is used cold. It is used in the grounds at
Windsor Castle, Kew Gardens, and at the seats of many hun-
dreds of the Nobility and Gentry, from whom the most flattering
testimonials have been received, which HILL & SMITH will
forward on application.

Sold in casks of about 30 gallons each, at 1s. 6d. per gallon,
at the Manufactory, or 1s. 8d. per gallon carriage paid to any
Station in the Kingdom.

UNSOLICITED TESTIMONIAL RECEIVED MAY 3, 1877.
"The Ryleys, Alderly Edge, Manchester.—Messrs. Hill &
Smith.—Sirs,—For some 20 years, I have used your 'Black
Varnish,' and shall be glad if you will forward me another cask,
as I consider it the best thing known for the preservation of all
outdoor work, either wood or iron, that requires to be painted.
—Yours respectfully, ALFRED LOWER, J.P."

Apply to HILL and SMITH, Brierley Hill Ironworks, near
Dudley, and 118, Queen Victoria Street, London, E.C., from
whom only it can be obtained.

CAUTION.—It having lately come to the knowledge of
HILL & SMITH that spurious imitations of this Varnish are
being offered by unprincipled dealers at a slight reduction in
price, they would especially draw attention to the fact that every
cask of their Varnish is legibly marked with their name and
address, without which note is genuine.

The best **MONDAY** Agricultural Journal.
The only Illustrated Agricultural Journal.

THE
AGRICULTURAL GAZETTE

(ESTABLISHED 1844),

FOR LANDOWNERS & TENANT FARMERS.

Every Monday, price 4d.; post free, 4½d.

The **AGRICULTURAL GAZETTE** gives
full Market Reports, both Metropolitan and Provin-
cial; accurate Accounts of Prices and Sales,
Proceedings of Agricultural Societies, Farmers
Clubs, and Chambers of Agriculture—their
Meetings, Exhibitions, and Discussions are
Reported fully, and with promptitude.

EVERY DEPARTMENT of the ESTATE
or FARM receives attention—Land Agency,
Estate Equipment, Forestry, Farm Buildings,
Roads, Fences, Cottages—Live Stock, Plants,
and Implements of the Farm—Drainage, Till-
age, and Manuring of the Soil.

The **VETERINARY DEPARTMENT** of
the paper is under Professional Editorship.

Departments relating to the **POULTRY**
YARD, the **APIARY**, and the **GARDEN** of
the Farm are also under separate Professional
direction.

REVIEWS are published of all Books claim-
ing a place in the Library of the Farmer.

REPORTS of Noteworthy Estates, Farms,
Herds, Flocks, and Factories, are given from
week to week.

Teachers and Students of the several sciences
in which the Agriculturist is interested—
BOTANY, CHEMISTRY, PHYSIOLOGY,
ENTOMOLOGY, NATURAL HISTORY—
are constant contributors.

Especial attention is given to **AGRI-
CULTURAL IMPLEMENT** manufacture.
Improvements in Machines are reported—New
Inventions made known—Patents discussed—
and the Implement Factories of the Country
described. Engravings, always necessary in
such cases for intelligible description, are given
without stint.

No expense is spared in **ILLUSTRATIONS.**

Not only Implements, but Plants, Weeds,
varieties of Cultivated Crops, &c.; and Animals
—Breeds of Horses, Cattle, Sheep, and Pigs;
also Poultry, Insects, General Natural History;
and Buildings—Farmhouses, Homesteads, Cot-
tages; Photographs illustrative of Country Life
and Occupations, whether at home or abroad;
—all these provide subjects for the Engraver.

Portraits and Memoirs of Noteworthy
